Barley: California's Greatest Grain.

Seventeenth of a Series of Sketches in Which the Editor Presents Suggestions, Drawn from Long Experience, of What Californians Have Done and May Do for the Advancement of California Agriculture.

IF ONE had knowledge of the facts and insight to discern their full significance he might go into a barley field and read in this one common farm crop the history of California and the characters and achievements of Californians. For though barley is counted small from a broad American view and though it has to be grouped with rye, buckwheat, sorghum grains and spelt to make up the "minor cereals" to which statisticians allot only about one-fourteenth of the cereal acreage of the United States, barley is the greatest cereal of California and it illustrates the uniqueness of the State and the originality of its achievements quite as well as do some other products which are popularly received as indicators of novelty and greatness.

Barley's Paradise Regained.—It is of course strange to think of barley illustrating novelty in any way for it was the chief bread grain of mankind long before Pharaoh's barley was shattered out by the hailstones of Moses or Ruth drew smiles through the beards of Boaz and his barley. It is interesting, however, to remember that though barley did consent to go 12,000 feet high on the Himalayas, and north to Scotland on the map of Europe, it always manifested preference for semi-tropical salubrity and was the chief bread grain around the Mediterranean until the ancient Romans brought wheat from Egypt and took to feeding the barley to their horses as they are doing in Italy and Spain to the present day. Now out from Spain came the Spaniards, holy and otherwise, to uplift the savages by noble toil and themselves by the products of it, and brought barley with them—to Lower California in 1697 and to our California in 1769. But barley had previously reached the Atlantic coast, presumably from points in Northern Europe whence came the Pilgrims and their fore-running prospectors, for barley is recorded on Martha's Vineyard in 1602; in Virginia in 1611—becoming abundant there by 1648, when it was smoked out by tobacco. Barley was grown where now stand the sky-scrapers of Manhattan island as early as 1626, and in 1796 was counted the most important farm product of Rhode Island.

Thus the Atlantic colonies had the start of the California missions with barley and they tried to make it conform to their conditions by the stern discipline which they practiced on everything, without success. Barley kept sighing for the deep warm soil of the Nile valley, for the blue skies of Italy, for the dry summer air of Spain, and the Eastern coasters cast it out because they could only get about twenty bushels per acre and only then on land rich, early, warm, and mellow and a better chance than oats would be grateful for. All the things it sighed for barley found in California and yielded incredibly, even under the rude husbandry of the padres—who simply allowed it to help itself to sky, air and rainfall as it liked. Thus before American occupation barley had made itself at home in California.

At the East people took to growing oats as easier: in California the

movement was reversed, for barley was easier because of favoring soil and climatic conditions. Thus one can find the uniqueness of California history and California nature in a barley field.

What American Pioneers Did with Barley.—Perhaps the first thing they did was to lie about it: however, the reader must judge. At the first fair ever held in California, which was in San Francisco in 1851, a sample of barley was shown from San Jose valley of which it was said: "This sample represents a crop of 965 bushels from less than five acres." As this would be 200 bushels per acre, we do not pass upon its credibility. Can any reader support it from experience or good report? At the same fair another sample was shown "representing a crop of 53,000 lbs. from 12 acres, grown by Madame Scoofy of Sonora." As this would be about 100 bushels per acre, it is reasonable, for such a crop has been frequently reported at that date and since then, also.

At the same fair there were mentioned stools of wheat and barley "with 150 and 200 mammoth stalks from one root—the product of single seeds": which is also credible. And the free-stooling of barley during our long winter-growing season is matched by the succession of

Barley, Sacked and Stacked Where Threshed, Is Safe Outdoors in California for Two or Three Months. A More Up-to-date Method of Harvesting Is Illustrated on Page 10. Tractors and Combined Harvesters Thresh the Grain and Spread the Straw Without Handling It. The Latest Is to Haul Grain from Harvester to Elevator Without Sacking It.

volunteering. In 1856 a committee of judges for the State fair made this memorandum: "Near Santa Clara on the road to Alviso we saw a field of fifty acres of volunteer barley. This is the fifth crop from a single sowing and the yield this year has averaged 43 bushels to the acre. It has received no special care."

It is difficult now to appreciate the sensations of pioneer farmers who came from parts of the country where barley was abandoned because it required the best land and best care to get even 20 bushels to the acre! Here was a man reaping annually more than twice that much barley from seed he sowed in 1851 and had never given the field anything but a little harrowing since that date. He must have thought he had discovered perpetual motion in barley!

But the greatest thing the pioneers did with barley was to quickly make California the chief producer of the grain in the Union, for the California product in 1857 was 5,980,485 bushels, while the whole United States in 1850 produced only 5,167,000 bushels.

Why So Much Barley?—We have stated that early Californians, both Spanish and American, took to barley instead of oats because the former was easier to grow in the more arid parts of the State, where the early agriculture was undertaken. This was owing both to acceptance

LOCATION OF FEDERAL LAND BANKS.

FULFILLING its promise of prompt action the Federal Farm Loan Board has attained the first great transaction devolving upon it by the Federal Farm Loan Act of Congress, approved July 17, 1916. It has visited all parts of the country and taken testimony therein. It has carefully considered its findings and hearings, in the light of its original conception of the purposes which the new national legislation desired to attain, and it has located the twelve Federal Land Banks as follows:

First—New York, Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, and New Jersey—at Springfield, Mass.

Second—Pennsylvania, Delaware, Maryland, Virginia, West Virginia and District of Columbia—at Baltimore, Md.

Third—North Carolina, South Carolina, Georgia, and Florida—at Columbia, S. C.

Fourth—Ohio, Indiana, Kentucky, and Tennessee—at Louisville, Ky.

Fifth—Alabama, Mississippi, and Louisiana—at New Orleans, La.

Sixth—Illinois, Missouri, and Arkansas—at St. Louis, Mo.

Seventh—Michigan, Wisconsin, Minnesota, and North Dakota—at St. Paul, Minn.

Eighth—Iowa, Nebraska, South Dakota, and Wyoming—at Omaha, Neb.

Ninth—Oklahoma, Kansas, Colorado, and New Mexico—at Wichita, Kansas.

Tenth—Texas—at Houston, Texas.

Eleventh—California, Nevada, Utah, and Arizona—at Berkeley, Cal.

Twelfth—Washington, Oregon, Montana, and Idaho—at Spokane, Wash.

The law provides that each of these district land banks shall include in its title the name of the city in which it is located and it shall be organized, and "temporarily managed" by five directors appointed by the Federal Loan Board. After the subscriptions to the stock in the district bank shall have reached the sum of \$100,000, the bank shall be given permanent form by the election of six directors, to be known as "local directors," by the stockholders and by the appointment of three directors by the Federal Loan Board—constituting a permanent board of nine directors: the terms of one government and two local directors expiring each year. The local directors will be chosen by the national farm loan associations from lists of candidates furnished them by the Farm Loan Commissioner at Washington, and these lists shall present the names submitted by the farm loan associations in response to a request for nominations which the Commission shall send to each of them at least two months before such election is held. In this way the loan associations make the nominations and elect the local directors of the district bank as their representatives. The stockholders in the district banks will be chiefly the borrowers who are members of the loan associations, who are required to subscribe for such stock to an amount equal to 5 per cent of the loan made, and which will be deducted from the face of the loan made to each. Other subscriptions to stock in the district bank shall be open to individuals, firms or corporations, approved by the Federal Loan Board, or to the government of any State or of the United States. At least one director of a district bank shall be a practical farmer, and no director shall be,

during his continuance in office, an officer, director, or employee of any institution, association, or partnership engaged in banking or in the business of making or selling land mortgage loans. The management of the land banks is to be kept from association with other banking institutions, and presumably out of the sphere of influence of such institutions.

Thus it appears that the organization of the twelve Federal Land Banks awaits the appointment of "temporary directors" by the Federal Loan Board for each of them. It has been announced from Washington that such appointments will not be long delayed.

* * *

WHY AT BERKELEY?

COURSE the Federal Farm Loan Board could not be reasonably expected to give the data determining its choice of locations, after having studied situations for months as its members have done. Such an undertaking would not soothe contention, but simply give it a fresh run. Therefore, everyone is at liberty to comment upon the reasons for a selection as he sees fit, and to win others to his view if he can. To us it seems clear that Berkeley was chosen for several reasons, which may include the following:

First, its enclosure in the greatest financial center of its district, to which some of its transactions must stand closely related.

Second, its possession of sources of accurate knowledge of soils, climates, production, and producing problems beyond any other city in its district. This is secured not alone through the agricultural and related departments of the University of California, but through the local habitation in Berkeley of branches of the United States Department of Agriculture which have to do with research and administration throughout its district and through proximity to other branches, with similar wide scope, which are established in San Francisco, of which Berkeley is a prominent suburb. As the land bank will be concerned directly with what land is and what land can do, not alone in a single farming region, but throughout a district of four very large States, which Berkeley knows better than any other city in any of them, it seems natural that administration should proceed from a point thus qualified to administer.

Third: Berkeley and San Francisco give domicile and activity to more men who have made rural credit a subject of systematic study and traveled observation for years than any other point in the district. These men have been widely accepted as leaders of public opinion on the subject in the district. It includes both men and institutions committed to making this type of banking, which is new to this country, widely influential and successful. They are of this mind because land banking of this type is not banking for what can be made out of it, but banking for what it can help rural men and rural institutions to do for themselves and for the public at large.

We say these things, not, of course, from any knowledge of the reasons upon which the Federal Farm Loan Board acted, for neither we nor anyone else may ever know those reasons, but simply from our own conception of the relation of things.

* * *

WHAT IS A LAND BANK LIKE?

WE FEEL quite tender toward Sacramento in her manifestation of disappointment over vanished expectations of securing the location of the District Land Bank. It usually does not comfort a lover to tell him that the unwilling object of his adoration is neither a Venus nor a Minerva; but we must ease our conscience of the facts. A land bank is not much of a municipal ornament, nor a great gratification of civic pride. As financial and other institutions go, it is not even a good-looker. It will build no steel-frame skyscraper veneered with marble; it will not even build a warehouse of reinforced concrete. It will have no polished brass plates on granite plinths to flash its name in the public eye. It will have no ponderous mahogany doors, disclosing tessellated tiles, as the directors intrude their 1917-model tail coats, with flashing watch-seals swinging tangential to their frontal curves. It will open to the

visitor's eye no perspective of onyx, sustaining glittering grill-work, through the wickets of which glad-handing tellers dispense sweet smiles to depositors from beneath their polished pates or bristling pompadours. There will be no lackeys in onree katz liveries, bowing lady clients to consultations with investment experts, no perfume of roses clouding forth from lady's parlors, no aromas of Partagas stealing from directors' rooms, no jingle of coin, no laughter over well-worn financial repartee—in fact, nothing which constitutes a great city bank a thing of metropolitan joy and satisfaction.

A central or district land bank has no depositors, no checking accounts, no short loans as favors to those well introduced, no generous gifts to purposes of public benefit—nothing whatever of personal interest. Its silence is broken only by the shuffling foot-falls of mail carriers and other transportation emissaries. It deals with no man individually; it is simply a deep, dark financial mud-flat, through the sloughs of which millions ebb and flow from distant sources where there may be blue waves playing upon sunlit sands. After quite a study of central land banks in Europe we concluded that the establishments were combinations, in various ways, of two elements: an undertaking parlor and a bookkeeping school. The managers sit glum between caskets of reports on titles, values, mortgages and bonds. The clerks sit everlastingly with their fingers on the books and their eyes on the clocks. Really a land bank has not even the human interest of a sand bank, for that may sometimes resound with the notes of traffic, the straining of the steam shovel, the rattle of gravel, the hooting of the switch engine, and the cries of workmen. Not so with the land bank; its traffic is only spectral; it is the perch for ghosts of transactions enacted elsewhere. Why does Sacramento mourn the loss of such a sepulchre?

* * *

CHANCE FOR LIGHT IN A DARK PLACE.

A FEW days ago a traveling representative of the Pacific Rural Press reported to us that he had met a grower of fruits in Sacramento county who complained that he was not getting honest returns from a San Francisco commission merchant; that he had shipped fruit which was sold on a certain day, and returns made to him on a basis of 50c per box. Afterwards a visitor told him that he had bought the fruit with his brand on that day for \$1.25 per box. This is a very old trouble, and this is not the most dramatic phase of it, for growers have chased their own shipments into the market and have bought the stuff themselves (incognito) for much more than the price the seller afterwards reported to them. Against such dishonesty, which is more or less frequent, the grower has had no practicable remedy. There has been, of course, a remedy at law, but the plaintiff would have to hire a lawyer, pay the costs of testimony, etc., etc., and come up against a defendant who had nothing subject to recovery. This expensive form of vain relief does not commend itself to a grower, and so he has had to vent his feelings as best he could; change his commission merchant and go through the same experience again perhaps. This has long been a very sore spot on the marketing end of production in nearly all food lines. It has been carried to the Legislature from time to time, and efforts have been made to require receivers to report prices and names of purchasers to their consignors, but receivers have convinced the Legislature that such recourses are impracticable. It is very fortunate that a proposition now comes forward which we believe will receive the enthusiastic support of producers. Colonel Weinstock, State Market Director, will request the Legislature to pass a law which will give him power to inspect the books of any commission house wherever the shipper is not satisfied with the return from his produce. With the new law in effect the State Market Director will be able to make a thorough investigation of such cases, and decide each controversy on its merits. Such a law, with proper penalties, would doubtless force dishonest receivers into some other line of crookedness, against which the public may have less effective protection.

THE CHANCE IN THE NEXT BEST.

INQUIRY for fruit trees is very keen, and nurseries which are befriending the public with announcement of their offerings in our advertising columns are already meeting planters' drives which make them wish they had budded a lot more stock in 1915, or even last June. Of course, the demand is running unevenly and not always reasonably, for many planters are plungers on the basis of what they consider "straight tips," instead of thinking out for themselves and forgetting that experience has shown that during a run of years there is not very marked, if indeed there is any, superiority among our leading commercial fruits in the line of extreme and average profitability. All good standard varieties are good plantings in the proper places for them. For ourselves we should be a little scared of planting what everybody advised us to plant, for other things being equal, there is always a chance of reaction from what everybody advises, because of the very prevalence of the action

which it enjoins. If, then, of several fruits to which really good fruit soils and situations are usually adapted, we should find everyone else had emptied the nurseries of a certain tree, we would probably be just contrary-minded enough to plant something else—providing we kept well within the lines of cultural success and commercial suitability, as our best judgment discerned them. Of course we do not advise freak planting of untried and undemonstrated fruits, nor even unreasonable indulgence in novelties of standard fruits, because no one else is doing it, and is thus leaving open a great chance! What nobody else is planting has probably not yet been demonstrated to be worth planting. And yet here is still an opening with well-tested fruits which are not at a moment the best sellers at the nurseries, and to them planters should give due consideration. If the blondes are all snapped up, you may be even happier with a brunette. It is certainly a reasonable risk to take, for the world goes 50-50 that both are good.

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address

Rotation a Local Question.

To the Editor: You advise a rotation of crops and suggest several different ones for our more fortunately situated brothers in the valley districts. Is there a rotation of crops you could recommend for this section?—C., Amador county.

Rotation is not only a local question as to kind of land you have but also local as to your own outfit for making use of the crops. The simplest rotation is to grow hay or grain one year and seed early with winter-growing forage plants and run stock on the land the following year. Of course if your land is naturally seeded with such forage plants, as is usually the case, you will save money and therefore make more by this alternation of grain and pasture. Another term of a longer rotation would be to get a rainfall crop of stock beets by planting right after the fall rains, unless you get too low December and January temperature. This depends upon your elevation. It can generally be done at least up to 1500 feet elevation. Or you can winter-work deeply and follow, after coldest weather is over, with early planting of potatoes. You can sell or eat the potatoes, but you need stock to make use of the beets. After a winter crop of stock beets you can get some sorghum unless your land is very dry. This running comment may serve to show that you must not expect very definite rotation prescriptions in this State. Think it out for yourself, keeping an eye on what your thinking neighbors are doing with good results.

Between Times for Hogs.

To the Editor: I would like to know what there is that I can grow, here in the foothills, to carry my hogs from the time the grass dries in the spring until barley is ready for them to hog down, and from the time the rains start in the fall, after the acorns are gone, until the new grass gets high enough for them to feed on.—Reader, Jackson.

You can probably grow stock beets in winter, from fall-sowing, and have them ready for spring feeding. If there is moisture enough you can plant them again in the spring for late fall feeding. Also, if you can get water even on a little good land, you can grow a lot of squash which can be kept for use after the acorns are gone. For green feed, to start after the fall rains and to come quicker than wild pasture, probably nothing is better than a sowing of rye.

Probably Only Winter Grazing.

To the Editor: Will you advise me which is the best seed mixture to sow on burnt-over foothill brush land lying two miles east of Jackson, in Amador county? We also have some land on which we are cutting the brush preparatory to running goats, and which we want to seed. I read your answer to "H. M., Amador Co." in your issue of July 22, 1916, in which you mention "bur clover, wild oats, filaree, etc." but do not state the proportions of each to sow. How would it do to include *Bromus inermis* and sweet clover? Could rye grass be included in the pasture mixture?—D. C., Jackson.

You can probably count on nothing but winter pasture on such land without irrigation. That you can get from bur clover, filaree and wild oats and you might get something from adding sweet clover which would hold verdure longer into the dry season than the others. *Bromus inermis* and rye grass would also make something of a fight but would die during the summer—unless irrigated. You can sow 5 lbs. of filaree, 10 lbs. of bur clover and 50 lbs. of wild oats to the acre. If you do not dry-feed them they will thickly reseed the land they occupy and a good deal of the rest of the ranch for the second year. You must not expect to get summer verdure on dry uplands without irrigation.

Catching-in on Unbudded Seedlings.

To the Editor: To use some almond seedlings not budded last summer I am wondering whether I can work them with a "pushing bud" (as described on page 76 of California Fruits) leaving them in nursery to form yearling trees next fall or bench-work with whip grafts and set out in place as fillers throughout the orchard. I experimented last spring with the latter method without success, due, I believe, to scions drying out before the sap flow from transplanted roots reached them. I am wondering if this method, which appears better than spring budding and losing chance of getting trees into place, would be surer if grafts were put immediately in callusing frame until ready to set out in orchard. Probably the budded trees in nursery would be a greater asset at the end of the season than the "overlooked," scattered results of the second method. What is your opinion?—Reader, Live Oak.

We would not use either of the methods you mention. The "pushing bud" is an interesting amateur method which takes a lot of time and gives a large percentage of failures. The root-graft we might try on the pear and apple (but not on the almond) and would plant in nursery and not in place. We would not put in orchard anything but a good yearling. The seedlings you mention we would June-bud; pinching the tips of some new shoots to get good plump buds earlier. Cut back and force growth on buds when seen to have taken.

Fertilizers for Inter-Crop Beans.

To the Editor: What kind of fertilizer can I sow to make beans grow better. The land is sandy and for years and years was sown to oats, barley, etc., till the land is not as fat as it ought to be. I have a lot of barnyard manure to put on. I know that is good but I have not enough to go over, and would like to sow a fertilizer that will help me get more for my work and if possible build the land by growing beans between pears. Some of this land has had beans, some alfalfa. I do not get enough to the acre of alfalfa to suit me, but beans seem to do pretty well.—E. L., Winton.

We would apply about half a ton per acre of a "complete fertilizer" and trust the trees to get the benefit of what the intercrop misses. If, however, you wish to figure on the crop's getting enough nitrogen from the manure and the wreckage of the preceding beans and alfalfa, you may use 500 lbs. of superphosphate and 200 lbs. of potash. Apply

this evenly after spreading the manure. It will help to grow a lot of green stuff, from the seed in the manure, and you can plow all in together in February or March and get it reduced by bean planting time. You have learned one good thing in the fact that beans like stable manure—when applied long enough before planting.

Beans on San Joaquin Plains.

To the Editor: Do you think the Lady Washington bean planted about July 1st would mature successfully on a rather heavy loam which holds the moisture all summer after being flooded and properly worked during June? The land is located near Ceres. In localities where the Lady Washington bean is grown how many pounds of seed per acre is planted and how deep should the planter be set: also for Pink beans?—D., Ceres.

It depends upon how many frost-free days you can count on after July 1 and whether you will run into too much fall rain for harvesting. You need something more than 110 good days to get a bean crop generally. Large white beans are rather treacherous on the plains and we should not try to start them in the fierce heat and drouth of midsummer—except in a well-tended garden or in a river bottom. Pink beans are much more apt to succeed. The depth of covering would be about one inch of well-pulverized loam and two inches of sandy soil—with a little more depth in both cases when planting as late as you propose. Large whites take about forty and Pinks about thirty pounds to the acre.

Double-Cropping for Fowls.

To the Editor: I have a 4-acre piece of land of sandy loam soil. What can I plant and have two good crops in one year and in what month to plant it? I am starting in the chicken business. Would you try cabbage for the first crop and Egyptian corn for the second? I have plenty of water.—P. R., Van Nuys.

Yes; cabbage makes a good winter-growing green feed. The plants should have been started with the seed two or three months ago to get results early. Perhaps you can find plants now which you can buy in quantity at reasonable prices. Why not put part of the land in barley and let the chickens harvest it next spring—breaking it down for them, if necessary? You ought to have no trouble growing milo, Kaffir or some other sorghum after you get the cabbage and barley off next May.

Manure and Alfalfa Sowing.

To the Editor: I have spread considerable stable manure on an old alfalfa field, intending to plow (soon) and reseed to alfalfa; but a friend tells me that he put some stable manure on a piece of land, sowed alfalfa seed and it burned up. Some he did not manure did fine.—G., Lakeport.

It is, of course, a mistake to plow under coarse manure just before sowing a fine seed like alfalfa and it will sometimes burn out grain to do that. As you probably have to sow alfalfa in your section rather late to escape frost it will be safe to plow in manure deeply now and work again fine and shallow just before sowing.

Red Spider on Beans.

To the Editor: I intend to plant some string beans in the spring but all vines around here for several years have their leaves turn rusty and fall off after bearing a few beans. What can I put on the vines early in the season to prevent it? They say it is red spider.—W. D., Middletown.

There is nothing you can do when planting the beans. Watch the plants closely and begin sulphuring the leaves as soon as you see the first signs of the spider. You can gather and burn or, better still, spread and plow under deeply now all the litter of the last crop.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco, for the week ending at 5 p. m., January 2, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		To Date	Normal	Max'm	Min'm
Eureka	1.76	12.22	17.37	50	32
Red Bluff	2.20	9.96	10.33	48	28
Sacramento	1.78	6.13	7.30	48	32
San Francisco	1.51	9.11	8.56	50	40

San Diego23	2.35	3.28	62	40

Pointers on Cherry Varieties.

[Written for Pacific Rural Press.]

The struggle for survival of the fittest of cherry varieties in California, that has been going on since the days of gold, still shows no hope for the sour varieties except perhaps in Southern California, but much hope for the sweet varieties where growing and market conditions are favorable.

Cherries have been dried in Santa Clara Valley at least, but that industry is creating no comment, and is useful only for culls. Canning and shipping are the outlets for cherries.

The normal canned pack is about 1200 tons of Royal Annes and white varieties annually, and about 400 tons of the black varieties. The blacks are not popular because they color the syrup and become dull colored themselves. Cannery sometimes take them solely to get enough whites. A. E. Crabb of Alameda county, however, maintains that the Black Tartarian is the only variety for canning because it retains its rich flavor, while Royal Anne does not. But C. H. Bentley of the California Fruit Cannery Ass'n points out that the market demands a clear transparent syrup and a firm clear-colored cherry. Highly colored Royal Annes turn brown in processing and the consumer thinks they have been bruised. Nevertheless this variety commands about 50 per cent higher prices than the less firm and more poorly textured white varieties and the blacks for canning. However, one of the oldest and biggest cannery men in California once told us that it was a shame to put up cherries lacking in sugar, hard, and green as are demanded, and sell them to folks whose indigestion would be still further increased.

Growers of Royal Annes have the choice of picking early for canneries or later for shipment East. Most other varieties are less elastic in marketing opportunities. The soft whites are as hard to ship as to can, but since most of them are earlier, they bring high prices if in good condition.

In the shipping of cherries, California uniformly packs them in 10-pound faced boxes costing 10 to 15 cents a box for packing and a little more than that for the boxes. Some are put into pasteboard cartons at additional cost. These must compete, on the auctions, with northwestern cherries in pint boxes of veneering, packed only enough to put stems downward for the top layer, and 24 per crate. This is much cheaper and it avoids the pressure which in the California boxes often makes the face-cherries of white varieties turn brown. Royal Annes are more brittle and likely to burst under pressure in packing than those of more elastic skin and flesh like the Chapman.

Since cherries are the first deciduous fruit on Eastern markets, their prices are very high, wholesaling at over 20 cents per pound for some time. Thus it behooves the districts where early cherries can be produced to plant only the early varieties.

There is a keen rivalry between the Vacaville and Sacramento river districts to send the first shipment each season. Imperial Valley might

go earlier, but cherry trees do not seem to thrive there. In the Vacaville district, with no irrigation, only the early varieties seem profitable; and there are not many Royal Annes. E. H. Goepfert recently planted Chapmans and Burbanks because Bings are too late; and even Tartarians he figures would have to compete with the Chapmans from other districts. He notes that Chapmans and Rockports always have heavy crops, but the Burbank is a shy bearer. Fruit shipping records for one year kept by the Vacaville Fruit Growers' Ass'n show their shipments to have been: Belle d'Orleans April 21 to May 1, Chapman April 29 to May 13, Rockport April 28 to May 30, Purple Guigne May 4-12, Burbank May 6-23, Black Republican (Lewelling) May 15-31, "Bigarreau" May 16-25, Pontiac and Bing May 20-30.

Varieties recommended for Santa Clara Valley by G. W. Worthen, one of the most successful growers of the Willows district, are "Napoleon Bigarreau" (Royal Anne) like the old trees first planted here, for both

canning and shipping, Black Tartarian, Black Republican, and Bing for shipping." He defends the climate of Santa Clara Valley for these varieties; and warmer climates like Vacaville for the earlier varieties. Another successful grower there notes the regular bearing of Royal Annes, and heavy bearing but small size of Black Republicans in his district; though certain districts get size on this variety. He begins to pack May 10 to June 1, shipping his blacks to Eastern auction and his Royal Annes to auction or cannery, whichever pays best. When he ships Royal Annes, he waits till they are "red clear through."

In the Sebastopol section of Sonoma county, L. Hillis, one of the best growers, recommends Black Tartarians and Royal Annes, for canning only. Royal Anne predominates there, and "as a rule, Tartarians are planted for pollenization purposes only."

In Napa county, Royal Annes and Black Tartarians are recommended by County Horticultural Commissioner J. J. Fox for canning and eastern shipment. These varieties should be interplanted to get them to set well.

Distillate Spray for Black Scale.

[Written for Pacific Rural Press.]

Black scale is about the only insect pest on apricots in Ventura county according to Horticultural Commissioner A. A. Brock.

The usual means of control is a distillate-soda mechanical mixture with water, applied as a dormant spray. For this scale, distillate is considered better than crude oil; and crude oil would have to be emulsified with soap which would add to the expense.

Seven pounds caustic soda is dissolved in a small amount of water and added with 12 gallons of 28 degree distillate to about 185 gallons of water already in the tank. The distillate last fall was costing 5 cents in carlots at Los Angeles, though Ventura county got a carlot at 3½ cents according to Mr. Brock. Soda cost 6 cents a pound.

It is very necessary, in using such a mechanical mixture, to keep the agitator busy all the time while spraying. If it stops awhile, the oil separates and if not thoroughly

stirred before spraying again, comes out nearly pure, which damages the trees. It is known to have killed some trees by accumulating around their bases. Likewise the spray hoses should be emptied back into the machine.

One grower in Ventura county had an 180-gallon spray rig which he thought held 200 gallons. Mixing his spray for 200 gallons, he got it too strong and did considerable damage before a horticultural inspector found the trouble. The tank was then built up and a good agitator put in.

For black scale on olives, a distillate miscible oil or emulsion or mechanical mixture is the best and cheapest. A crude oil emulsion sticks to the leaves and makes them turn yellow and drop according to State Horticultural Commissioner G. H. Hecke, who has tried it. Distillate soon evaporates. It is more penetrating while it lasts, but does not clog the leaf pores too long.

Light Regular Pruning.

[Written for Pacific Rural Press.]

Out of the varied ideas of pruning orange trees will come a general system which will be recognized as best. At present one man believes in practically renewing his trees every three years, while another claims this is unnecessary, that they should be pruned and generously thinned out every year. Among the latter is Fred Arth of San Bernardino county, who has a most healthy orchard and gets good crops regularly, even from his Valencias. His regular crops are supposed to be due to his regular pruning, plus regular fertilization and other care.

He does not like to set back the tree by pruning the top off all at once, however necessary this may seem on some orchards previously

allowed to make "umbrella tops" from sucker wood. Moreover, he maintains that fruit which comes close to the trunk or main limbs is always coarser and does not pay for the cost of raising and picking it. This is at variance with the general opinion; but it leads him to keep the main branches clean. Anyhow, if inside fruit wood is allowed, the pruners are likely to leave suckers. He aims to get all the fruit in a thick blanket of foliage and fruit wood over the outside of the tree. He takes out all inside limbs which are dying back or not bearing. He wants to see through the trees.

Pruning is done in February after frost and before blooming, or else after fruit is well set.

Uncultivated Hillside Apple Orchards.

To the Editor: Some of the apple growers of the Mendocino coast are giving up the idea of cultivating their orchards because orchards situated as they are, on hillsides or at least on sloping ground, wash too much with the winter rains; and the more intense the cultivation the more the wash and the greater the loss. The ruts usually start with the first rains, following the wheel tracks; and by spring they have grown into gullies. If these are leveled up by drawing in more good soil from the sides, the next winter will take it all out again. The only way to check this, then, is to haul in rocks and that will interfere with future cultivation.

A plan under consideration, and which has been adopted by some, is not to plow the orchards at all but allow them to grow up to grass and weeds. This crop is not mowed, but left standing. Then they work around every tree—with a hoe heavy enough to cut deep—for three or four feet in diameter. This loosens the tree in the collar, gives it a chance to breathe and allows the rain to penetrate the ground. When the leaves fall in a cleanly cultivated orchard, they blow off until they find lodgment somewhere. By this method they fall in the grass under the tree and stay to mulch and fertilize it. If a grass

fire should sweep through, the trunks of the trees are protected. As an illustration, there are numerous small abandoned orchards in these hills planted by the timber workers years ago. Most of these are never pruned or cultivated and yet they bear every year. Your comment on this will be highly appreciated.—C. Q., Gualala.

A winter cover crop is highly desirable in any orchard—much more so where the soil washes. But one of the legumes planted "a-purpose" would be far better than a natural growth of grass and weeds except whether bur clover or other legume takes practically complete possession.

Without irrigation, however, there is grave danger that cover crops of anything in summer would rob the trees and fruit of needed moisture. So the winter cover crop should be plowed under before the ground gets hard in spring, and a dust mulch or some other kind of a mulch maintained.

You would probably not try to make a living from the abandoned orchards you mention, without pruning, cultivation, etc.

Hoeing as you propose around old trees would be of doubtful value except perhaps for fire. A tree doesn't breathe around its collar, but it often gets crown gall and other troubles through injured spots.

Getting a Poor Kill of Insects.

[Written for Pacific Rural Press.]

Two prime causes of a poor kill of orchard insects are mentioned by Stanley James and J. D. Crummey of the Bean Spray Pump Co. The first is indifference to their presence and entire lack of spraying. The second is delay of spraying until conditions of work, weather, and ground are such that a thorough job of spraying is not done.

Methods, equipment, and materials are now so well standardized that only neglect can be given as the reason for pest-ridden, mossy, diseased orchards, except in case of bacterial and so-called "physiological" diseases.

One reason that delayed spraying is less effective, according to these gentlemen, is that time is required by crude oil sprays to do all of their work. According to Mr. Crummey, probably 80 per cent of the kill of insects is accomplished in the first two days after spraying. The volatile oils of the crude oil evap-

orate mostly by that time and suffocate the insects with their fumes. The rest of the kill extends over six weeks, killing by slow penetration and clogging of the pores.

According to this, there should be at least two days of good weather after a spraying, to get maximum benefit; and six weeks more before the spring activities of the bugs begin.

Pressure and Nozzle.—Plenty of pressure is especially important to get the "red spider" (brown mite) eggs; and a mist spray is not effective for winter use. Mr. James recommends a Bordeaux type nozzle which makes a fan-shaped sheet of spray. The fan of spray can be run vertically against the limbs with minimum waste; and should be applied directly to all sides of the limbs. Then it can be spread horizontally over the top of the tree to catch any tips which escaped the vertical spraying.

Cheap and Efficient Refrigeration.

[Written for Pacific Rural Press.]

The problem of refrigeration on a small whole milk dairy is often a vexing one because of the expensive equipment required.

On the Laurel Dairy in San Luis Obispo county this has been satisfactorily overcome by partitioning off a refrigerator room from the main milk room with concrete.

The refrigerator proper is seven feet high, five feet wide and six feet long, having two two-inch walls with a space between for air circulation.

The entire structure is of concrete having concrete floor, also tight-fitting thick door which opens

out into the milk room.

Cooling is accomplished by the use of ice, 300 pounds of the latter being required every 10 days in order to keep the temperature at the desired degree.

As the milk is drawn from the water cooler it is bottled and then put into crates, the latter are piled onto a small, iron-wheeled truck the proper length and width to fit snugly into the refrigerator, allowing space for the ice. It is held in this manner till time to put on the wagon for delivery and reaches the consumer at a satisfactory temperature.

TALKS ON Nitrogenous Fertilization

Number 6

When should Sulphate of Ammonia be applied?

SULPHATE OF AMMONIA

For ORANGE groves in regular bearing the ideal way is to divide the total amount, say 8½ to 10 pounds per tree, into several portions distributed over the growing season. One may be applied about six weeks before blossoming, one when the petals begin to fall, and subsequent ones in June and in September. If labor cannot be spared for this, the first and last periods will probably give the best result.

For LEMONS, as they are in continuous bearing, even more frequent applications are advised—say, six or even eight—after irrigation.

For GRAPEFRUIT, the special requirement is that they shall size up well, hence a large portion of the total amount may be applied when the fruit is half grown.

For TRUCK CROPS, broadcast Sulphate of Ammonia, 100 to 300 pounds per acre, before seeding or setting out the plants, or divide into two portions and apply one before planting, the other between the rows when the crop is well started.

For FIELD CROPS, apply broadcast by hand or machine at time of planting.

Manzanillos are Favored for Orchard.

[By Frank Simonds, Sec. Los Angeles Olive Growers' Ass'n.]

Relative to our experience with the Manzanillo variety of olives, our orchard consisting of a few thousand acres, located at Sylmar, is about half planted to the Manzanillo variety and the results obtained from that portion of the grove have exceeded the results obtained from any other variety of olives we have planted. The advantages to be gained are as follows:

(1) This variety ripens about three weeks earlier in the season than any of the other pickling varieties, consequently the fruit can be put on the market a little earlier than the competing varieties and thus obtain any benefit that may be derived from having the fruit on the market before the bulk of the crop is ready.

(2) This variety on account of ripening a little earlier permits the packer to prolong his season of packing olives and thus permits him to utilize his machinery and equipment a greater number of months in the year than would be possible if the Mission variety only was grown.

(3) This variety, by ripening a little earlier in the season permits

the fruit to be harvested before any damage is done by frost, in those sections of the State where frost is likely to occur.

(4) We find the Manzanillo fruit can be more easily brought to the larger fancy sizes than the Mission variety and inasmuch as the larger sizes are in demand by the public, and bring the highest prices, the Manzanillo is favored in this respect.

(5) As to flavor of the fruit after it is processed and cured ready for the market, we find the Manzanillo fruit, if properly handled, has as good a flavor as any other variety of fruit grown.

(6) The Manzanillo for us is more regular in its crops under adverse conditions than any other variety of fruit grown for pickling purposes. We most always expect, if we have any fruit at all, that the Manzanillo olives will never fail us.

To any one planting an orchard, we advise a division of varieties, planting a portion of the trees to Manzanillo and another portion to Mission olives. by doing so they will not all ripen at the same time, thus allowing the farmer more time in which to harvest his crop.

Tragedies on Peach.

To the Editor: Last spring I grafted Tragedy plums to Muir peach trees. These trees were possibly seven years old. Early in the summer and fall many of the plum growths broke away from the graft, taking even the graft itself. That is, the entire growth would pull right out of the tree, indicating that no union had been made. Since then I have spoken to a number of fruit men, as well as nursery dealers, and am told that as a rule plum grafted to peach is not satisfactory, that is, a good union will not be made.

Some have suggested that we use what trees seem to have a perfect union and take out the others, entirely replacing them with new trees. Others recommend to take out all the trees, stating that though conditions at this time might seem favorable it would be necessary at best to prune closely so that there would not be too large a crop at any time, and even then the weight of the trees would be too much and would pull away on account of faulty union. Others recommend the necessity of tying the different limbs together within a year or two with wire so that the wind would be unable to play its force on any one particular part of the tree. The trees now seem to have a good top, and as

I examined them yesterday apparently the union seems to be all right, though after speaking to a number of men who ought to be well posted in matters of this kind, I hardly know just what to do. There are 216 trees, and it seems a shame to tear these up, but at the same time, if in the course of five or six years it is necessary to replant, it would be better to do this now.—I. C. A.

A number of European plums fail to make good union on peach; and from your experience, we should say that Tragedy is one of them. Did the grafts blow out in a big wind? Was the cambium of the grafts knit into that of the stock,

or just loosely attached? Let's hear from readers, not only on this sub-

ject but also on how to make Tragedies bear well and regularly.

PEAR PRUNING TO CATCH THRIPS.

[Written for Pacific Rural Press.]

"Year before last we had an awful lot of thrips in our pears," says A. C. Tucker of the F. H. Buck Co. in Solano county. "They took the crop in one corner.

"We have so much pruning and winter spraying to do that now we leave our pear pruning until the buds are swelling and some in bloom. That catches thrips in the buds where we can burn them. To get still more of the insects, we leave the prunings on the ground a half day to trap those that are still coming up."

This does not overcome the need of spraying for thrips in spring, but it minimizes the number that might escape the spray and injure the crop.

We Insure You Trees Free From Disease

Don't gamble on the future of your orchard.

Don't risk the loss of several years of your time and the waste of your money by getting nursery stock that may be infected with crown-gall or root-knot.

IF YOU BUY OUR FOOTHILL GROWN TREES

they will come to you clean. The foothill lands on which we grow our trees are immune from crown-gall, root-knot and diseases common to other localities.

Our trees are propagated from the best parent trees of their kind. They have those well-branched fibrous roots, such as are grown only on our foothill soil and location. These roots are tree insurance—hardy trees—heavy producers of good fruit—profit makers.

For years we have grown nursery stock and have successfully operated 1000 acres of commercial orchard. All our experience in fruit growing and shipping is at your disposal.

If you are in doubt as to what trees to plant—if you are having trouble in your orchard—or have orchard problems—write Bergtholdt.

Our foothill grown trees are in great demand. Many varieties are selling out fast.

If you want disease-free, foothill-grown Pedigreed trees, send us immediately a list of your wants for special quotations.

SILVA-BERGTHOLDT CO.

PEARS OR APRICOTS FOR WET PLACE.

To the Editor: Do you think the apricot would do well on this heavy soil where the almond seemed to die on account of sour-sap? What root-stock would you advise, also what variety of apricot? Do you think Bartlett pears would do successfully on that heavy soil? The hardpan has been blasted.—V. E. K., Sacramento.

Apricots on your heavy soil where the almonds die on account of sour sap will probably do very well if put on myrobalan root, which does not take well with the almond tree.

For apricots on well-drained soil, apricot or peach root would be most desirable. Apricot root is very well liked by gophers and peach root is not, so if you are much troubled with these rodents, it might be better to use peach root, if your drainage is good.

Bartlett trees are generally planted in the low wet places in orchards where other fruits would not grow, and the chances are you will be well satisfied.

NITRATE OF SODA SETS ORANGES.

"Three or four pounds nitrate of soda scattered around each tree when the blossoms are opening will set the fruit," said C. C. Chapman of Fullerton, speaking especially of Valencia oranges and especially of old trees which have been more or less starved.

"But my notion is that an orange tree ought to have enough inherent strength without such stimulation, to both continue its growth and set a heavy crop of fruit."

The Experiment Station has shown the danger of long-continued use of nitrate of soda alone, although they also say that perhaps some combination may be found which will neutralize its injurious effects.

SPRAYING FOR GRAPE MILDEW.

To the Editor: I have a spray outfit and am spraying trees for blight. What I want to know is what can I spray vines with for mildew? The vines are old and the mildew gets worse every year. I used sulphur several times during the season with poor results. I would deem it a great favor if you would tell me of something to use as a spray. What time of the season is best for spraying for mildew?—W. L., Fowler.

Winter spraying for grape mildew will be unsatisfactory because of the shaggy bark and because of infection during the growing season from neighbors. Spray with 12 pounds atomic sulphur per 100 gallons of water when shoots are about six inches long and repeat the spray when first signs of mildew recur.

TOPS CITRUS TREES EARLY.

[Written for Pacific Rural Press.]

We have occasionally seen trees and whole blocks of citrus orchards killed by cutting them back at the wrong time for the purpose of growing new sprouts in which to insert buds of better fruiting strains.

A warning not to cut the tops off too late in the season is given by J. C. Perry of San Bernardino county. He has noted that otherwise they sunburn more or less, and the

new growth is stunted, even though the stubs and trunks are white-washed. The best time for Navels, he thinks, is right after the fruit is off in March or April.

SPRING CARE OF GRAPES.

[Written for Pacific Rural Press.]

Making grapes leaf out quickly after frost danger is considered past is the practice of A. H. Hevener of Imperial county, who has three acres of Muscats and Malagas. He leaves them alone after pruning about mid-January until he is ready for them to grow. Then he plows a furrow as close as possible on each side of the vines. These furrows are then flooded, because winter rainfall here

is light. Then the dirt is turned back into them. Mr. Hevener says this brings the shoots out quick. He did it early in March last year.

If the weather is warm, they bloom in a week or 10 days. No more irrigation is given till the berries are the size of buckshot, as it is considered that irrigation during blooming prevents the fruit from setting. Suckers are rubbed off three or four times before the grapes are sized up, because they rob the fruit. It is easy to sucker three acres in less than a day, but if they are allowed to harden, they will have to be cut, and will be hard to find among the other growth.

Plant only rooted trees in place.

PEACH ROOTS AFFECTED BY DIFFERENT TOPS.

There is a difference in the growth of roots with different tops, according to C. W. Van Gelder of the Central Nurseries Co. in San Joaquin county. His observation is that a peach root with peach top grows straight down; while with an apricot top it spreads all over.

Tragedy on peach root stood more water than peach on peach root; and the same is true of any other fruit that makes a good union on peach, says Mr. Van Gelder. He had a block of peaches and a block of plums, both on peach roots in a low wet place. Every peach tree died; while the plum trees were not hurt.

Plant Apricot TREES

THE COMMERCIAL PLANTER—THE MAN WHO PLANTS IN LARGE QUANTITIES—KNOWS THAT HE MUST GET A PROFIT ON HIS CROP. THE HIGH PRICES PAID FOR APRICOTS THIS PAST SEASON IS BUT A MERE INDICATION OF WHAT IS ALMOST A CERTAINTY IN THE YEARS TO COME—AND THAT MEANS PROFIT IN A LARGE SENSE FOR EVERY GROWER. As California has practically a monopoly on Apricot culture—due to climatic and soil advantages—there are enormous possibilities before the man who plants now.

Be Safe-Be Sure-Plant GOOD Trees

The best prices are always paid for the fancy fruits—and you know that it is folly to expect fancy fruit from inferior trees. Therefore plant the best.

Roeding's True Trees Are the Best

Thousands of successful growers all over the West will testify to the exceptional quality of our stock. For a third of a century we have been supplying fruit and ornamental trees and vines—and our stock this year comprises a magnificent assortment not only of Apricots, but everything that the planter wants.

Let Us Advise With You

Tell us what you propose to set out this season—the nature of your soil, etc., and let us advise with you as to what is best suited to your locality. We are always glad to counsel with planters or prospective planters as to the outlook for not only this season, but the coming years, and what are going to be the probabilities of your receiving a profit when your trees come into bearing.

Field Eradication of Bermuda Grass.

[Written for Pacific Rural Press by W. F. A. McIntyre, Thermal.]

I noticed in your paper that you are interested in methods of eradicating Bermuda grass. You may then care to hear of the essential features of the best practice in this part of the State.

I have been successful in totally destroying Bermuda grass in infested fields by the following method, which is advocated among the most up-to-date ranchers here as the best for this region.

First, as to certain characteristics of the grass which offer an opening for an attack: there are two things which Bermuda grass cannot stand; namely, exposure of its roots either to the heat of the summer sun or to the frosts of winter. Other points to be borne in mind are: 1, that the grass will stand prolonged submergence under water; 2, it will come to the surface from a considerable depth beneath the soil; 3, it will endure more white alkali than nearly all cultivated crops.

Remembering these characteristics, the procedure is as follows: The field containing the grass is pastured closely during the spring months, allowing it to dry out. This weakens the vitality of the grass and causes the rootstocks to grow nearer the surface. While the foregoing is not absolutely necessary, it helps materially by weakening the grip of the plant.

In early summer, or as soon as the ground is almost completely dried out, the field is plowed with a turning plow as shallowly as possible (about three inches), using care to

cut the furrow slice off clean and turn it completely over. The grass must be cut off below the underground rootstocks and cut off completely. By plowing so shallow, the next operations are made easier.

After plowing, the field is disked with heavily weighted discs, going over it often enough to cut the sod up thoroughly; or else a disc plow may be used, set very shallow, going crossways to the direction of the first plowing. The latter is only effective in light soils, however, as in heavy soil a disc harrow is necessary to loosen the dirt on the grass roots.

Following the disking, the field is gone over once with a spring-tooth harrow to bring the pieces of grass to the surface. This spring-toothing is repeated at intervals of two weeks during the summer to insure exposure of all the grass to the rays of the sun.

In the fall the land is plowed deeply (the deeper the better) and planted to barley, onions, or other winter-growing crops.

A cultivated crop the following spring, or else a summer-fallow with thorough cultivation, to kill what seed sprouts up, should mean the end of the Bermuda. Of course, the success of the method, as with every other method, depends on the thoroughness of the work.

Here on the desert, Bermuda grass is considered not an unmixed curse. The humus furnished when the Bermuda sod is killed out improves the soil amazingly. In bad

alkaline areas, where plenty of water (as a flowing well) is available, a recommended method of procedure to bring the land under cultivation is as follows: After leveling and checking as for alfalfa, the ground is kept thoroughly irrigated and the Bermuda (whose seed is brought in by the wind) allowed to grow. This forms a fine pasture (the alkali having small effect on the grass). If kept in pasture for several years and thoroughly irrigated meanwhile, the alkali is lessened to an extent that will permit

the growing of other less resistant crops. The irrigation washes the salts downward and away, while the sod prevents their re-accumulation at the surface by greatly reducing surface evaporation. This method can be followed on land that is too salty for alfalfa.

Due to the success of methods (such as the one described) or eradicating it, ranchers here have not only lost their fear of Bermuda grass, but actually sometimes lay at its door some bumper crops raised on land where it has been killed out.

Farm Values of American Crops Dec. 1.

[Written for Pacific Rural Press.]

The farm value of 24 crops for the United States on December 1, 1916, was \$7,642,000,000, as against \$5,891,000,000 a year ago, according to a telegram sent by the U. S. Dept. Agr. Statistician to the Geo. W. Herbert Co. of Chicago, and forwarded to Pacific Rural Press. Seven cereals, corn, wheat, oats, barley, rye, buckwheat, and rice, total \$4,246,000,000, as against \$3,426,000,000 a year ago. The hay crop, based similarly on farm prices Dec. 1, was \$1,162,000,000, as against \$1,056,000,000 a year ago; cotton lint, \$1,080,000,000, is against \$604,000,000; vegetables, potatoes, onions, cabbages, \$500,000,000, against \$289,000,000; fruits, apples, pears, peaches, oranges, cranberries, etc., \$301,000,000 against \$274,000,000; miscellaneous field crops, \$352,000,000 against \$245,000,000 a year ago.

Farmers should be great buyers of

farm supplies and machinery in this year of prosperity.

PROTECTED NEWLY-SET GRAPEVINES FROM RABBITS.

[Written for Pacific Rural Press.]

Rabbits got 2200 out of the 3500 grapevines B. H. Fisher of Kerman planted in the spring of 1914. He had almost a perfect stand at first, but replanted 2200. The rabbits took lots of these also; but they have not bothered the vines replanted in 1916. After replanting the rooted cuttings last spring, he set paper sacks down over them, tearing the bottoms, and leaving the open ends up. A little dirt thrown into the sacks held them in place, and the vines thrived; but the rabbits were afraid of them. Some of the sacks remained all summer and fall.

Prune Trees

Exceptionally Fine Stock

French, Standard, Imperial, Tragedy, Sugar and others. On peach and Myrobalan root.

Write for present low prices on any number of trees wanted. Can make immediate shipment, if desired. No delay thru inspection.

Armstrong Nurseries

ESTABLISHED 1889

Apricot and Peach Trees

The best to be had at any price — trees of "certain" quality and true varieties. Six standard varieties of Apricots and 32 best varieties of Peaches; including the Millers' Late, which is decidedly the finest late peach yet introduced. Write for prices on any number of trees wanted.

Ascolano Olive Trees

Walnut Trees

Franquette, Mayette, Eureka, Placentia, etc.

Thrifty, "stocky" trees; free from "blight" and other diseases; grown in rich sandy loam soil—producing the finest root system: Trees, that when planted, will make a quick start and vigorous growth. Write for prices on the number, size and variety desired.

Almond Trees

Extra fine stock: Clean, thrifty and well rooted.

Best Commercial Varieties
No Plus Ultra, Jordon, Nonpareil, Texas Prolific, I. X. L., Drake's Seedling, etc.

Will make you attractive prices on any quantity, size and variety. Write TODAY, stating your "wants." Can make immediate shipment.

The Ascolano (Queen) Olive, is the largest and best of all ripe pickling varieties: "large as a French prune and much like one in shape." On account of its desirable size, excellent quality, attractive appearance, it meets with ready sale at fancy prices. Ripens early.

Every Olive orchard should have, at least, one-third Ascolano trees; and, in time, will prove your best investment.

Can supply extra fine trees, scientifically propagated from the best producing "strain" of Ascolano trees in the State. Prices quoted on application.

MISSION AND MANZANILLO OLIVE TREES.

Propagated from the largest and best "strains." Trees that will make a quick start and a vigorous growth; will bear early and produce a maximum of highest quality fruit.

Can supply all sizes, in any quantity at lowest possible prices. Write, stating your "wants."

John S. Armstrong, Prop.

406 Euclid Avenue,

Ontario, California.

Ornamentals

Roses, Vines, Shade Trees

Largest stock and most complete assortment in the State. Over 250 distinct varieties of Roses. Many new and scarce varieties and the Latest Introductions.

Deciduous and Evergreen Shade trees, Ornamentals and Shrubbery. Every variety adapted to both Coast and Interior climatic conditions.

Acacia and Eucalyptus trees in all varieties. Write for "special" prices.

If desired will advise with you relative to your proposed plantings, and make you a low estimate on cost of same.

1917 Descriptive Catalog and Price list FREE.

Barley: California's Greatest Grain.

(Continued from first page.)

of aridity and to the greater resistance of barley to rust. But this was not the full explanation of the California rush to barley, which rests chiefly on the superiority of barley to all naked grains for stock feeding. By virtue of its kernel contents and its adhering to chaff, barley is really the only rival of oats, both in nutritiveness and in digestibility. Although in this conclusion Californians merely add their experience to that of the ancient Mediterranean peoples, they had a long struggle to convince others of the stock-feeding value of barley. It took a full half century, for instance, to convince the quidnuncs of the U. S. Army that barley was a wholesome cereal food for a government mule and if it had not been for the accident of feeding this noble animal in the Philippines with supplies from the Pacific Coast, where barley was abundant and oats were shy, it is probable that to this day barley would be banished from the official mule menu. But the vindication of barley must now be considered indisputable, for both the victorious grand champions from the University of California Farm at the Chicago show last month had barley as their chief grain feed. In this respect the victory of barley is illustrative of the issue California has had to make against the other states in many matters in which they are stupidly conservative. Such victory has usually had to be reached by knocking them down.

Relations of Barley and Wheat in California.—The barley points in this rivalry are these: barley was great first; wheat was great last and in greatest product for a single year, wheat has but a small margin.

The production of bushels of barley and wheat in California in the years cited has been as follows:

	Barley	Wheat
1850	9,712	17,328
1852	2,973,734	271,763
1860	4,415,426	5,928,470
1870	8,783,490	16,676,702
1880	12,463,561	29,017,707
1890	17,548,386	40,869,337
1900	25,149,325	36,534,407
1910	26,441,954	6,203,206
1915	39,440,000	6,688,000

As compared with other states, as already stated, California took the leadership in barley before 1860 and maintained it for half a century. In 1909 the leadership went to Minnesota and in 1915 North Dakota advanced above Minnesota, making California third in the barley list; but the differences between these three states are small and the unfavorable season of 1916 in the Northwest restored the leadership to California.

How did the Northwest Get in on Barley?—But, the reader may think, if barley is so characteristically a California thing and California conditions so exceptionally suited to it, as you have claimed, how did those other states get into big business in barley? It is this way:

As already stated barley has quite wide adaptability—from two and a half miles high on the Himalayas to the north edge of the map of Europe and so on. In this country it has also a wide range west of the Mississippi

river. Splendid barley is grown in the Rocky Mountain States, and to the northeastward, in North Dakota, Minnesota, Wisconsin and in Canada. In this region barley succeeds, not because it likes hardship but because it is naturally very rapid, in its course and can therefore sprout in the gentle springtime and sprint to a harvest before the autumn rains and fogs dim its brightness. Under such conditions barley is sown from April 15 to May 25—about the time of its ripening in California. Growing in the California valleys from fall and early winter sowing, it advances more slowly during the rainy season, stools more amply and under favorable conditions makes its notable acre-yields in this State. But the relatively much greater advantages in California are, by themselves, not enough to secure supremacy. The advantage of the northwestern states of the Mississippi valley which gives them a call on California are commercial, not cultural. They have a home market in the great malting establishments of Milwaukee, Chicago, St. Louis, etc., at nominal cost for transportation. California barley has 2000 miles to cover to reach the same customers, when the railways make a rate which is not prohibitive and if it has to chase around by water and rail it has two or three times as much distance to kill to reach the same markets. For this reason California surplus barley has mostly made the long ship-run to European malsters. Of course this is not all of this interesting phase of the question, but it will do, to suggest that the incoming of

others does not dim the brilliance of California's capacity for barley. In fact it gives another illustration of the claim that all of California can be read in a barley field, for in no product for which we are famous

have we so far done much more than touch the edge of our producing capacity. If all the world does not go bone-dry California can tickle its ribs with refreshment of a minimum alcoholic content, along all its paral-

Over 25 Years
Experience back of every Tree,
Vine, and Shrub that we sell.

Plant Nursery Stock Now!

This is the best time of the year to put out Trees, Vines and Shrubbery and we are in a splendid position to supply your wants, as we still have a very complete stock.

In the leading commercial varieties of fruit tree stock we have

- IN ALMONDS, on both Peach and Almond Root—Nonpareil, Drakes, Seedlings, Texas Prolific and Eureka.
- IN CLING PEACHES, on Peach Root—Tuscon, Phillips, Albright Orange, Sellers Orange and Sim's.
- IN FREE STONE PEACHES, on Peach Root—Muir, Elberta, Foster, Lovell, etc.
- IN NECTARINES, on Peach Root—Stanwick, New White and Hardwick.
- IN PEARS, on both French and Jap Pear Root—Bartlett, Winter Nellis, Winter Bartlett, etc.
- IN PRUNES, on both Peach and Myroblan Root—French, Imperial, Robe de Sargeant, Tragedy, etc.

We handle everything to be found in an up-to-date nursery. Send us a list of your requirements.

The Final Answer To the Tractor Fuel Question

Every farmer knows that the best paying, most economical tractors are those that operate successfully on kerosene.

But every farmer can't tell a real kerosene tractor from an imitation before he buys it. It takes an expert to do that.

Neither does he want to take someone's word for so important a feature. That is not good business.

We believe that a farmer who buys a machine costing hundreds of dollars is entitled to get what he pays for. He should be fully protected in such an important purchase.

We know that Titan tractors are real kerosene tractors. They are built to operate on kerosene. They operate successfully on kerosene. When we sell one we guarantee it to operate on kerosene, writing that guarantee into the warranty that you get when you sign the order.

When you buy a Titan tractor you are safe. You have the written guarantee of a responsible Company that your tractor will do good serviceable work using common coal oil as fuel at all loads.

That is the final answer to the tractor fuel question.

Titan tractors are now built in three sizes, 10-20-H. P., the 3-plow outfit; 15-30-H. P., for 4 and 5 plows; and 30-60-H. P., for the heaviest work of the largest farms. All operate on kerosene.

The 10-20-H. P. size is recommended for all kinds of farm work within its capacity. It is a two-speed tractor, 1.85 and 2.50 miles per hour, with a smooth running twin cylinder engine, slow speed, mechanically oiled, starting and running on magneto. It can be used for any field work you would expect nine or ten horses to do, and it will run any machine that takes up to 20-H. P. at the belt.

If you place your order soon you can have a guaranteed Titan tractor for the heavy Spring work. Start now to get acquainted with this dependable line of tractors. Drop us a line so we can send you full information at once. Don't wait. Write now.

lels and meridians. The settlement of this question will determine the future of barley in California although its stock-feeding service will always give some greatness to the product.

A Pioneer Dream of Beer.—It is interesting to note in this connection that the pioneer barley growers of California had rather an ambitious dream of what they could do with the barley which, as we have seen, sprang to a surplus production almost as soon as they touched it. In 1866 from this surplus exports were made, chiefly to Australia, of 741,815 bushels which suggested this dream, recorded in that year:

What shall we do with our immense barley crops? We are growing hops of the very best quality and within two years the supply will exceed the local demand. We are annually importing millions of gallons of malt liquors for which we are exporting thousands of gold. Overburdened with barley and hops we should not go abroad for ales and porters, but should supply our own demand. This being accomplished we could save England the trouble and expense of doubling Cape Horn or the Cape of Good Hope to supply the immense quantities used by her colonies in the Indies and make money by the operation. The State offers a liberal premium

therefore a descendant of a Spanish or Mexican variety which the padres introduced about 150 years ago. This is a more reasonable belief, but we are not aware that it has been demonstrated. We can, so far, find no description of the barley grown at the missions preceding the coming of the early Americans. If any reader can cite such a description, we would deeply appreciate it. In the absence of this knowledge we present an inference that the mission barley, which was probably used as seed by the pre-argonauts, who came in the '40s, and was first used also in 1850 by the gold-seekers, made familiar a type of barley different from that which became prevalent later. The evidence of this is perhaps more interesting than strong. In 1858 there was growing on the farm of J. Adriance near Marysville a field of 80 acres of a "new variety of barley" and to it was awarded the first prize for barley in that year by the California State Agricultural Society. The judges give this account:

In 1855 Mr. Adriance discovered, in a field of ordinary barley, a cluster of thirty-two heads from one root; the heads of peculiar shape, and quite uniform in size and length.

for the first ale exported and proved to stand sea voyages and changes of climate.

In accordance with this offer the State of California offered \$375 for the first considerable shipment of sea-going beer, but we do not find record of payment thereof to a local brewer. However, California has contributed largely to the beer of the world, for exports of California barley in 1915 reached a total of 26,754,522 bushels or two-thirds of the total barley product of the State in that year—and this was for malting at distant points.

Whence Came California Barley?—Knowing that barley has been grown in California since 1769, and that the variety most abundant since the American occupation is different from varieties largely grown elsewhere, has led some Eastern writers to surmise that California had a native barley from which the locally cultivated variety had been developed. Two conclusive facts oppose this view: first, California has no indigenous barley or hordeum species; second, California had no aboriginal population sufficiently energetic and intelligent to accomplish such development. All stories, then, that California barley is developed from a wild species are themselves wild.

Another assumption is that the common California barley is a legacy from mission agriculture and is

The head is round as an ear of corn, having six rows of kernels, evenly arranged around and each containing fourteen grains of round full barley. He saved and planted in drills every kernel, and from it planted again in 1856, and in 1857 had seed enough to broadcast 80 acres. It was visited by the committee on awards and found to present a most beautiful appearance—the short, strong stalk holding upright the round straight head, with uniform, bristling beards and free from mixture of other grains. Ten acres of the crop, a fair average of the whole, yielded 675 bushels of thoroughly cleaned grain weighing 50 lbs. to the bushel.

The inference is strong that this six-rowed barley was different from the kind then common or the committee would not have so carefully described it. It is also interesting that the description fits so closely the six-rowed variety which subsequently became recognized as so peculiar to California that observers considered it a development from a different wild species—as already claimed to be impossible.

We have no evidence whatever that Mr. Adriance's preservation of a chance seedling really did give California the barley which has made her famous, but it may have strongly set the fashion for a six-rowed barley which prevails to this day and which experts now fairly agree must be the coming fashion in all Western States which have much

Dependability!

You want a sprayer that can be depended upon to work with the least possible trouble—one that isn't going to take up your time for fixing and adjusting just when you need it most. You will get day in and day out efficient and dependable service from

BEAN Power Sprayers

There are ten big distinctive features which account for Bean Spray superiority. Chief among them are:

Bean Patented Automatic Pressure Regulator

Maintains any desired pressure whether nozzles are open or closed. When nozzles are shut off the spray liquid simply runs back into the tank without being put under pressure and the engine runs free. This saves one-third of the gasoline and wear and tear on the engine and pump.

Bean Patented Threadless Ball Valves.

Revolving on reversible and interchangeable brass seats; no threads to rust, corrode or stick tight; can be opened up entirely, every part removed in less than two minutes without lowering the pressure, stopping the engine or drawing the liquid out of the pump.

There are eight other big money and time-saving features that you should know about. See your nearest Bean dealer or mail coupon today.

The first step in stump blasting; making hole under the stump.

Loading sticks of Giant Stumping Powder in hole under center.

Giant Stumping Powder left the stump ready for easy handling.

Save money on your stump blasting

The explosives that get stumps out cleanest and cheapest are those that have a heaving and lifting effect, shattering the stumps just enough to break them up. Then you can handle them easily.

"The farmer," says an Experiment Station, "should use an explosive prepared especially for his work; one that stands all ordinary shocks of handling and transportation and does not easily freeze. He does not need and should not use the expensive nitroglycerine explosives." Thousands of farmers have taken this advice and have found that

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

always save them money because they go further than any other stumping powders. Also, because they are made especially to suit *western* farm and orchard conditions and because they are always uniform in composition and action.

Giant Farm Powders—the product of the oldest manufacturer of high explosives in the United States—are the only genuine "giant powders" for agricultural use. They are made in two brands—Giant Stumping Powder and Eureka Stumping Powder.

Giant Stumping Powder is the ideal explosive for blasting stumps in wet ground. It keeps perfectly for months, resists water and chilling, and gets the stumps out economically.

Eureka Stumping Powder is the money-saving, low-freezing explosive for blasting stumps in dry soil. It costs less than Giant Stumping Powder and careful blasters save many dollars by using it for wet work also.

EVIDENCE

I bought five boxes of your Stumping Powder and now I want to sell a lot of other powder that I have.

RUDOLPH STADELI, Silverton, Ore.

Your Stumping Powder has a wide breaking power and less fumes to contend with after being exploded than any other on the market.

G. L. METZGER, Hillsdale, Ore.

In using a thousand pounds of your Stumping Powder neither I nor any of my men had the least bit of trouble in getting the very best results. I have used practically every powder on the market and find there is more strength in yours.

J. L. EIDSON, Silverton, Ore.

Your Stumping Powder shoots the roots and spreads wide in the ground instead of going down. It is the best powder we have used.

G. S. McCARTNEY, Russellville, Ore.

I find your Stumping Powder all you claim for it.

ELI CLINKER, Camas, Wash.

I am a large user of powder in stump blasting as well as in grading roads, breaking boulders and making ditches. I get good results from the Giant brands all the time.

MICHAEL HARVEY, Charleston, Wash.

Giant Stumping Powder gives good results when all other means of removing stumps have failed.

ROBERT CHABOT, Moclips, Wash.

Make This Test

You want to clear your land as cheaply as you can. If you are not using Giant Farm Powders, try them *now*. Mark and mail the coupon at the right. We will have our nearest distributor supply you—at the lowest market price—with a 25-pound or 50-pound case of Giant Stumping Powder or Eureka Stumping Powder. Compare this with any other and *prove* for yourself that Giant Farm Powders will save you money, time and work.

We Issue Five Valuable Books for the Farmer

They tell and show how to remove stumps and boulders, how to increase the fertility of the farm by blasting the subsoil, how to have earlier-bearing, thriftier orchards by blasting holes for trees, and how to drain your land by using Giant Farm Powders. These books are written especially to cover Pacific Coast conditions, and will be helpful to every farmer. Choose the books that you prefer and *mark and mail the coupon*.

PORTABLE ENGINE DOES MANY JOBS.

[Written for Pacific Rural Press.]

A 5-h.p. gas engine is put to a multitude of uses on the Rancho Aptos in Santa Cruz county, where the chief business of some 2300 acres is to raise feed for beef cattle. They milk ten or twelve cows for ranch use and keep about 120 hogs on the side.

Perhaps the chief use of the engine is to grind, roll, and chop feed for horses, hogs, and cattle. Some 700 sacks of barley per year are rolled for horses and pig feed, according to R. M. Rhoades, who has charge of the engine. The roller has a capacity of 15 to 20 sacks per hour. No steam is available, so the rolling is not quite so nicely done as in big mills, for if too dry, the barley cracks instead of rolling. Barley and almost all feeds go a third farther if cracked or rolled, according to Mr. Rhoades, and butchers claim it goes one-half farther than whole grain if cracked and cooked. In winter the 14 horses being worked get barley three times a day.

Two feed grinders are used, one stationary, the other movable. About two tons of Indian corn were cracked last year for feed; and about 10 tons will be cracked this year when it is well dried. The machine crushes corn, cobs, and all, which are usually cooked in a boiler with other feed. It also grinds corn alone, which is run over a screen through which meal fine enough for house use is obtained.

At noon, the horses get chopped hay in equal quantities with the barley, to eat in the field. The hay is chopped as needed, for cows and horses, two men and the engine being able to get enough chopped in a day to last a week. Black oat hay is raised almost exclusively, though last year they cut about ten tons of lagoon grass hay. A bale is cut to 3/4-inch lengths in seven or eight

minutes. It is run into a box on three wheels in which it is mixed with grain and then run along in front of the mangers. Whether there is a saving of hay by chopping "depends on who is feeding it"; but there is opportunity for "quite a saving over whole hay."

While we were there, the engine was hitched to a fanning mill to clean beans. It had cleaned 6000 pounds of pinks in 2 1/2 hours.

It cleans grain for seed at 25 to 30 sacks per hour. About 600 or 700 sacks per year are cleaned, 250 of which are used on the ranch.

About a dozen cords of 4-foot wood per year are cut by the engine with a circular saw. Eight to ten cords are cut in a day of 10 hours, depending on how much bigger the sticks are than the radius of the saw.

The engine is mounted on two 4x8's with four iron wheels which are blocked while the engine is in use. One horse pulls it about the place and to different barns as much as a mile away. Which way it faces makes no difference, because the direction of rotation of any machine is changed by twisting the belt.

"We have used the engine three years," says Mr. Rhoades, "and we have never had trouble except when careless people handled it."

TRACTOR HELPS DEVELOP DAIRY.

[Written for Pacific Rural Press.]

For years Mrs. E. E. Clowes of San Joaquin county had been behind with the plowing on her 354-acre dairy and grain ranch. Her son of 17 years had been reading Pacific Rural Press, and last October convinced his mother that instead of buying three more horses besides the five already in use, a better investment would be a tractor. The clinching part of his argument was that they needed silage; and a tractor would avoid need of a gas engine to cut the corn. When seen in early November, 125 acres had already been plowed and as much more was still to be done. Oats and a winter-growing legume were to be planted on old alfalfa sod to prepare it for corn to be planted next spring after cutting the oats for hay. A hundred acres were to be planted to alfalfa for the 80 to 90 cows being milked all the time. This is to be chopped and blown into the barn by the tractor.

Certain parts of the place cannot be irrigated from the ditch water; so pumping plants are to be put in and run by the tractor in its spare hours. The aim is to keep the tractor busy the year around.

Auto trucks picked up 810 bags of beans one day in November, which had been left at the roadside by G. R. Fox of San Joaquin county to be hauled to market. That was much simpler for Mr. Fox than hitching up and spending his time hauling them slowly to town while an alfalfa crop was down.

KILLEFER

WHAT SIZE PIPE FOR IRRIGATION.

To the Editor: I am planning to put in some concrete irrigation pipe and should like to know what size I should use. I have a five-inch centrifugal pump with an eight-inch discharge. I think that I have about 800 gallons per minute. Part of the pipe would be laid so that there would be a fall of 8 inches to a hundred feet; the rest on the level. Would ten-inch pipe be large enough?—K. S. H., Sunnyvale, Calif.

With a 10-inch pipe and 800 gallons per minute, a fall of 8 inches per 100 feet would just about overcome the pipe friction. Where it runs on the level, you would need to raise the water at the pump about 8 inches for each 100 feet of level pipe line, or get the same pressure in another way, to get your 800 gallons per minute at the other end. Thus, if you want that quantity delivered at the other end of 1000 feet of clean, smooth pipe, you will need to lift it at the pump about 80 inches above ground to overcome the friction. Smaller pipe would require a greater proportional lift. Larger pipe would require less lift but you can judge the economy of that.

TRACTOR REQUIREMENTS AND COSTS.

[Written for Pacific Rural Press.]

"If I were going to buy a new tractor for farm work, and knew nothing of the different makes, I would first investigate the part that runs on the ground. The bull-wheel or track is the first to give trouble," says S. L. Martin of Ventura county. He has used a tractor of eight h.p. drawbar pull for about 16 months, to plow, thresh, and bale hay. He keeps 14 head of work stock also for plowing and other farm work. Repairs have cost no more than he expected, being about \$50 in the first year. A dust trap should be put onto every carburetor to work in fields to save engine trouble and repairs.

He uses about 420 gallons distillate, 25 gallons gas, and 30 gallons lubricating oil in 30 days.

"The tractor is all right for the man who knows how to take care of it," says he.

TWO-HORSEPOWER IRRIGATION.

To the Editor: What amount of irrigation do you think a two h.p. gas engine would supply, forcing it through about 500 feet of pipe and upward about 20 feet?—W. H., Angels Camp.

We have to guess at the diameter of the pipe and how much lift you must make in the pump. If you were pumping out of a reservoir with the pump at the surface of the water, there would be the equal of a 20-foot lift plus the pipe friction which in a 3½-inch pipe carrying 100 gallons per minute would equal 7.5 feet lift for your 500 feet of pipe. This would total 27½ feet lift, which would require a 2 h.p. engine. One hundred gallons a minute would cover 2¼ acres an inch deep in 10 hours not counting what would soak in. Perhaps you had better get a bigger engine.

Co-operative motor trucks will haul nine-tenths of all the fruit in Placer county from farm packing sheds to shipping stations within 10 years, is the forecast of Mr. Francis. He urges that all new packing sheds be built close to the roads for convenience in loading the trucks.

LAYNE & BOWLER PUMPS

Make active preparations now for next year's dry season. Install the Layne & Bowler Pump and be absolutely assured of the most dependable water supply. Layne & Bowler assurance is crop insurance. Consult our Advisory Department.

Our irrigation booklet No. 25 is free for the asking. It is profusely illustrated and contains a wealth of information you should know.

FIELD CROPS.

Livingston has shipped out 84 carloads of sweet potatoes to date.

California is now the fourth State in the Union in the production of rice.

Colusa invites any projector of a rice mill to take over a site for its establishment there.

The total output of wheat in the Porterville district for 1916 was 192,998 bags of a net value of \$496,255 to growers.

Strawberries which were grown on the mesa four miles east of Bakersfield were brought into that only last week.

An Arizona authority says that beans grown from hand-selected seed yielded 100 pounds more per acre than from seed not so selected.

According to reports of grain men in the Porterville district, the late rains have put the entire wheat district in the best condition in its history.

About 2,500 bags of beans were threshed around Visalia this season. They are valued at about \$13,000 and paid a profit to the growers of from \$50 to \$175 per acre.

Reports from El Centro say that the recent rain was a light one in that section but between there and San Diego the precipitation was heavy.

The Bureau of Crop Estimates, U. S. Dept. Agriculture, in a statement dated Dec. 18, estimates the area of autumn-sown wheat in California at 413,000 acres. This, of course, is only a preliminary statement.

Initial steps in the direction of forming a co-operative business organization for the purpose of obtaining financial backing for the hop-growing interests of the State, were taken at a meeting of hop growers held Dec. 28, at Sacramento.

Five thousand four hundred acres of sugar beets have been pledged by ranchers of Chico and along the line of the Colusa and Hamilton Railroad, to insure the operation of the Sacramento Valley Sugar Co.'s plant at Hamilton City.

A Japanese type of rice that will mature twenty days earlier than other varieties, and which it is claimed will produce a greater yield, is being put out by the Government's rice experiment station, five miles north of Biggs.

The Government experiment station north of Biggs has discovered no remedy for water grass on rice lands. Soil that is adapted to

nothing but rice, the farmers are advised to leave idle for a year. Where soil is good rotation of crops is suggested.

California lady bugs gathered in northern California are being sent to the big melon plantations in Southern California to combat destructive bugs. George H. Hecke, State Horticultural Commissioner, is anxious to know just how well they do the work.

The Spreckels Sugar Company at Salinas have donated the \$2000 necessary to send an expert to Australia to find a parasite for the beet leaf hopper that caused a million dollars damage last year. It is believed there is a parasite in the antipodes that lives on the beet leaf hopper.

Work is now under way on the sugar refineries at Manteca and Tracy. The Manteca plant is being erected by the Spreckels Sugar Company at a cost of \$2,000,000 and the one at Tracy is going up on the Whitehall Estate, financed by the Eccles interest, of Utah, at a cost of \$1,000,000.

Reports from the Imperial Valley say that 70,000 bales of the best cotton in the world is being picked. The crop, which is a big one, is being sold at a price far in excess of any ever before realized. Most of the crop has been contracted for at prices ranging from 18c to 24c per pound.

It is said that ranchers of Yucaipa Valley who planted potatoes this year have realized handsome returns from their investments and labor. Ranchers have found that potatoes of certain varieties do well in the soil of the valley. One rancher planted potatoes between the rows of his apple trees and the yield was enough to pay a large part of the expense of the year while he is waiting for the trees to bear.

CITRUS, NUTS, SEMI-TROPICAL.

It is estimated that the citrus crop of the Sacramento valley returned to the growers just about one million dollars.

Cull oranges that have been allowed to dry sufficiently are used locally for fuel purposes, says the Lindsay Gazette.

At the Board of Directors' meeting of the Lindsay Packing House Co., T. E. Anderson was selected as manager for a term of two years.

Fourteen thousand almond trees were shipped from Yolo county to Fresno county last week, the consignment making a full carload.

For the first time in recent years the entire walnut crop in the Santa Ana district has been entirely sold out. Local shippers are unable to fill orders on hand.

The Terra Bella News reports that a crop of Calimyrna figs from a 40-acre 10-year-old orchard east of Farmersville brought its owner \$8,500 gross, or \$212.50 per acre.

Orange men around Ontario are jubilant over the recent rains. It not only furnished much-needed moisture, but stove off killing frosts and generally helped the ripening of oranges.

The Sacramento Bee is authority for the statement that leading hotels in Chicago and New York are serving Sevillano olives to their guest at the fabulous price of three for 40 cents.

At a meeting of the stockholders of the Lindsay Fruit Exchange, Dec. 27, which has the largest packing house in the world, T. E. Anderson was re-elected as manager for the term of two more years.

On Dec. 28 it was reported that Corning and the surrounding country were covered with an inch and a half of snow. No fruit has been damaged. The orange crop has been mostly harvested. The olive crop

Japan Pear Seedlings

We have at San Jose, Cal., the following Japan and Kieffer pear seedlings. They are very good seedlings in first-class condition and will give splendid satisfaction. BIG SEED COMPANY IS DISTRIBUTING NEW CATALOG

AGGELER & MUSSER SEED CO.,
Of Los Angeles, Issue 24th
Annual Book.

One of the largest seed houses in the West, the Aggeler & Musser Seed Company, Sixth and Alameda Streets, Los Angeles, have just received the first edition of their new 1917 catalog, and are giving it broadcast distribution. This is their 24th annual catalog and it certainly surpasses any previous edition.

It contains many new features, such as hints to the home vegetable gardener, how gardening may be made easy, etc. In fact, the supplementary booklet called the "Garden Manual," which heretofore has been printed separately, is this year incorporated in the big annual, and is claimed to be one of the most complete seed books published. It contains answers to more than 1,000 questions, and gives information regarding all varieties of plants listed and is fully illustrated. Not only does it tell all about seeds, but gives full data concerning the correct tools and implements agriculturists should use to obtain the best results. Valuable hints on poultry, spraying, fertilizing and the use of insecticides are also given.

The Aggeler & Musser Seed Company will gladly send this descriptive, illustrated and interesting catalog free and postpaid to anyone writing and requesting it.

has also been nearly picked, excepting oil olives, and they won't be hurt.

The National Orange Show will be held at San Bernardino February 20 to 28. Most elaborate preparations are being made for the occasion.

There is a possibility that an orange standardization law will be presented for consideration at the next session of the State legislature.

The formation of a local citrus growers' association seems to have solved the marketing problem for the Orland growers. A fair price is said to have been obtained for all orange shipments made from that section this year.

While heavy frosts have been had for several nights the past week throughout Southern California, the free use of smudge pots and cloudy weather and an occasional shower saved the orange crop. No serious damage has been done so far.

Considerable decay is showing up in some of the citrus fruit shipped and many shippers attribute this excessive decay to the overloading of cars, which is being urged by the transportation companies to help relieve the car shortage.

The members of the Sutter Almond Growers' Association have received their final payment for the crop this year as marketed through the California Almond Growers' Exchange. The total amount distributed to this association was over \$55,000.

While a cold wave has swept through the Porterville district the past week, as not more than ten to twelve per cent of the orange crop remains unsold, little loss is expected, and lemon growers are keeping smudge pots lit and are in hopes of warding off any damage.

T. F. Fotheringham of Orland, under date of Dec. 28, says: "About two inches of wet snow fell last night, but it will be all gone by noon. Thirteen carloads of oranges have been shipped, but lemons are mostly unshipped. Some of them may be frozen, but not many."

Late telegrams tell of heavy frosts experienced in Florida. The temperature went down to 10 degrees above zero in some of the orange-growing districts, practically destroying the citrus crop. It is now predicted that the price of California oranges will reach a limit unrecorded in the history of the industry.

A general survey of nineteen cities and towns including all of the citrus districts of Southern California show that there were 1432 cars of oranges and lemons shipped East before December 22, and enough sold in stray cars to make 15,000 cars for the Christmas pool. These are the heaviest shipments on record for so early in the season.

The Australasian fruit growers, at their last conference held in Melbourne, voted down a motion for increased duty on American oranges and lemons, which was asked for by the fruit growers of New South Wales. A motion passed asking that California be urged to admit Australian fruits generally from districts free from fruit fly and other diseases.

DECIDUOUS FRUITS.

Fifteen thousand young fruit trees are ordered for planting in the "Thousand Acre" ranch near Colusa.

Farmers in Glenn, Yolo, Tehama and Colusa counties are contemplating extensive plantings of prune trees in their territory this season.

Over \$10,000 worth of stock in the State Prune & Apricot Growers' Association, Inc., has been subscribed for by the prune interests of Sonoma county.

The orchardists of the Oakley, Brentwood and Knightsen sections have enthusiastically endorsed the Prune and Apricot Association of San Jose.

The directors of the California Peach Growers, Inc., propose that Hanford business men finance the construction of a packing plant

there to the extent of perhaps \$25,000.

The Newcastle Fruit Growers' Association's last report stated that 454 cars had been consigned East, netting the growers \$300,000. The growers received \$5,300 as dividends, while the California Fruit Exchange of Sacramento, its selling agent, contributed further profits in the form of tonnage dividends.

MISCELLANEOUS.

Marcus A. W. Lee is the new Farm Adviser of Alameda county.

The farmers of Napa county have formed a Farm Loan association.

Organization of a farm loan association as a branch of the Placer County Farm Bureau has been perfected.

The Fifth Annual Farmers' and Housekeepers' Short Course will be held at the University of Arizona, Tucson, January 8 to 13, inclusive, 1917.

The Paradise Development Board and the Paradise Fruit Growers' Union are initiating a movement to secure a farm adviser for Butte county.

Berkeley has been selected as headquarters for the Eleventh District Federal Farm Loan Bank. The district includes California, Nevada, Utah and Arizona.

The Shorthorn herd at the Butte City Ranch is to be headed by a son of White Rock, a son of the famous Whitehall Sultan, some of the best Shorthorn breeding in America.

The territory east and south of Modesto has organized a loan association of Stanislaus county. Twelve farmers, representing proposed loans of \$50,000, signed up.

It is said that Los Angeles and San Francisco bankers will loan the Imperial Irrigation District \$200,000 for the improvement of the irrigation system of the Imperial Valley.

Eradication now of the yellow star thistle is impossible except in districts where the infestation is in its incipency, is the belief of George W. Hecke, State commissioner of horticulture.

The Kern County fair was a financial success, the profit side of the ledger showing \$3184.65 cash in bank, according to the report of T. F. Burke, secretary of the association, to the directors.

The Orland Livestock and Agricultural Society announce a combined (Continued on page 18.)

MISSION OLIVES EARLY RIPENERS.

THE EHMANN OLIVE CO.

Oroville, Cal., Nov. 17, 1916.
Mr. W. A. Hayne, Box 461, Marysville, Cal.
Dear Mr. Hayne: Answering your kind favor of the 15th, I am enclosing herewith photograph of some of this year's fruit on the Foggs grove, and you will note that they are above the average Mission. We also were able to harvest this entire crop before the frost, which shows that they are early ripeners. We will be glad to keep in touch with you on this matter, and if we can be of any further service, don't hesitate to let us know. Yours very truly,
(Signed) E. W. EHMANN.

I propagated the Foggs orchard thirty years ago. The origin of the Foggs trees was directly from the old Mission at Santa Barbara. The trees I have now for sale are full brothers to the Foggs olive trees, and, like the Foggs trees, they are all propagated from the large size cuttings.
W. A. HAYNE.

Announcing A New Sand

\$1095⁰⁰
F.O.B.
SANDUSKY.

THE principal aim in developing this 10-20 tractor has been to widen the field of usefulness for Sandusky service. It solves the power problems confronting the farmer who does not require our large machine.

At our first conference, three years ago, covering such plans the argument was advanced: "Why not build a small *cheap* tractor which will sell itself on account of its low price?"

Our *manufacturing facilities* would enable us to do this on a large scale. But this did not accord with the *policies of our President*, Mr. J. J. Dauch, who personally controls seventeen large manufacturing establishments throughout the United States and Canada, each operated on the basis of "quality always."

This point having been determined, our first small tractor was designed and built. Farmers who saw this model wanted it; so it was with the second. From every indication these machines were far ahead of what was then being marketed. But they did not measure up to our ideal—a small tractor that we could afford to back with a binding guarantee; one that we knew would maintain the reputation thoroughly established by our larger machine.

The result is a tractor embodying our utmost efforts—not toward reaching a low price machine, but one to fill the need for a good tractor capable of real service at as low a figure as modern manufacturing facilities can produce and an efficient organization can market.

Engineers of world renown have approved its design, incorporating the famous Timken worm and gear drive, as representing the ultimate standardized small tractor. Years will prove that this Company has again set the pace of leadership in the Model J, as has been true in the case of our Model E.

BRIEF SPECIFICATIONS

Our own specially developed four-cylinder, four-cycle, $4\frac{1}{4}$ " bore, $5\frac{1}{4}$ " stroke, quality motor. Drop forged high carbon steel crank-shaft, cam-shaft and connecting rods. Ninety-three percent tin base die cast interchangeable bearings. Valves enclosed. Combination force feed and splash oiling system. High tension magneto—impulse starter. Bennett air cleaner. A guaranteed kerosene burner. Surplus cooling capacity. Pulley for belt work. Adjustable cone clutch. Three speeds—2 and 3 m. p. h. forward and reverse. Timken David-Brown worm and gear drive. Hyatt equipped from motor to differential driving shaft, with universal couplings between motor, transmission and differential. This, together with *three-point* spring suspension, relieves road shocks, weaves and strains. All enclosed and protected against dust. Full steel construction. Short turning brakes. Weight, 4000 pounds. Length, 120 inches; wheel base, 76 inches; height, 52 inches. Rear wheel diameter, 48 inches; face, 12 inches and 6 inch extension rims; front wheels, 32 inches diameter, 6 inches face.

10-20 Model J
Burns Kerosene

OUR GUARANTEE

We guarantee this machine capable of delivering a constant 2,000-pound "drawbar pull. This is more than equivalent to handling two 14-inch plows at least eight inches deep in soil where a two-horse team can handle one 12-inch plow six inches deep, with a big reserve, or three 14-inch plows at depth formerly plowed with team and 12-inch bottom. We also guarantee it to deliver 20 horse power on the pulley, which furnishes ample power for the operation of belt machinery up to a 24-inch separator with full equipment—all on kerosene as fuel.

We further guarantee this machine free from defects in either workmanship or material for one year from date of acceptance and will furnish f. o. b. factory any such parts returned, transportation charges prepaid, for inspection and credit.

THE DAUCH MANUFACTUR

Sandusky Tractor—"Model J"

\$1095⁰⁰
F.O.B.
SANDUSKY.

TO his engineers Mr. Dauch said: "We are not interested in the manufacture of a *cheap* tractor. Our manufacturing and sales organizations are imbued with the *quality* idea embodied in our Model E. We cannot afford to demoralize these influences by putting out an inferior product merely to meet price competition."

These thoughts, together with the fundamental principle that this tractor must be adapted to the widest possible range of usefulness, dominated the development work in all its stages.

As a consequence the service which this tractor will render, the results it will produce in dollars and cents, the economies of labor which it will effect on your farm, make its purchase a profitable investment. The brief specifications below, and the more detailed description in our booklet, prove to any man that this machine offers a greater value per dollar than elsewhere obtainable.

Compare the Model J power plant with others. Consider its light weight—only 4,000 pounds; its Timken worm and gear drive, which actually increases in efficiency with use; its Hyatt Roller Bearing equipment. Remember that bevel gears and ordinary bearings mean friction, wear and loss of power. Remember our guarantees are based on the use of kerosene as fuel. Think! The result will draw your good judgment to this tractor like a magnet.

The Model J is a truly general purpose tractor, adapted not only to plowing, but also to the preparation of the seed bed, and all other farm power work, thus enabling you to profit by its service throughout the year.

It will be physically impossible to meet the tremendous demand of those who wait until their field work is in progress. We therefore urge you to write us at once, fully outlining your requirements. This will not obligate you in any way.

TRY IT BEFORE YOU BUY

Continuing the policy created by us in the sale of our 15-35 Model E Sandusky Tractor, we will put the 10-20 Model J on your farm, demonstrating its ability to fulfill our guarantees under your own local conditions, and personally instruct you in the handling and care of this machine. It must prove itself profitably adapted to *your* requirements before you buy.

BOOK J-131-FREE

It describes in detail the principles of design, construction and ability of this smaller "Little Fellow With the Big Pull." It will enable you to make a thorough study of the real merits of this machine as compared with other tractors. In writing place your problems before us and we will gladly assist you in solving them without obligation on your part. Be sure to ask for Book J-131

DEALERS OPPORTUNITY

The 10-20 Model J Sandusky Tractor offers an exceptional opportunity to high grade dealers who will stock this machine on protected territory contracts. We want men of quality to represent us—men who are abreast of the times, in position to give service to our customers, and willing to give the time and energy required to build up a real business. For such men we have an attractive proposition.

Look for this announcement in the principal farm papers. It will be followed by the greatest big-space advertising campaign ever put back of a tractor. This in itself will create a big demand for you. Send for our dealers' prospectus. It outlines in detail the policies underlying this establishment; also our complete plans for such co-operation as will rapidly develop this account into a good-paying, permanent business for you with ever-increasing opportunities.

Write today—better still, wire territory reservation.

BARLEY: CALIFORNIA'S GREATEST GRAIN.

(Continued from page 10.)

to do with the growing of barley.

But this does not answer the question of whence came our six-rowed California barley. It is probably unanswerable. As soon as the argonauts came in quantity barley ran out of supply and importations were made from everywhere. There were 294,000 sacks of barley imported at San Francisco in 1853, which gave the quick impulse to local production which we have already noted. It came from the four quarters of the globe and they all had six-rowed varieties grown chiefly for grinding. Some of these perhaps gave us our six-rowed which became our common barley. Possibly one grain from this shower of importation fell into the field of Mr. Adriance and gave him the call to his prize-taking.

Why a Six-Rowed Barley?—In the Pacific Rural Press of August 28, 1915, this writer indulged in a detailed discussion of the issue between six-rowed and two-rowed barleys in this State and how it became a winning fight for the six-rowed. That statement may be interesting to any one desiring to pursue this phase of the subject. It need only be said that the grower's idea that it is better to have six rows of grain on the head than two is reasonable not only on the ground that conditions of soil and climate favor a six-rowed variety and give greater weight of produce, but this greater vigor in the plant itself enables it to develop a kernel which carries amplitude of starch, gives a strong sprout in malting and a low albumenoid content which best serve a brewer's purposes.

The Outlook.—It is clouded, of course. Will Europe lose its thirst for malt liquors after the war or have no money to quench it? Will the United States find more than enough barley in the Northwestern States, as prohibition advances, and California be excluded by distance? How far can local feed uses be increased beyond the present one-third of the product? On the whole it looks as though it would be immediately safer to grow more wheat, for we can eat that, and less barley because we do not know how much of it others may wish to drink nor how long we can drink it ourselves.

AGRICULTURAL NOTES.

(Continued from page 15.)

stock and agricultural fair that will last at least three days and which will solicit exhibits from all sections of Glenn Co., to be held in Orland next October.

California representatives in Congress will be asked to secure an appropriation of \$35,000 at the present session of Congress for purchase and development of additional land at the U. S. Plant Introduction Field Station at Chico.

The development of a 50-acre tract of land in the Amargosa Valley in Southern Nye Co., Nevada, is to be undertaken by the University Engineering Department and Agricultural College of Nevada for an experimental farm.

The Board of Appraisers of the Merced Federal Farm Loan Association have started on an inspection of the property of the twenty-six farmers who have made applications under the rural credits law for loans aggregating \$100,000.

The Mountain Copper Co. and

Balaklala Copper Co. have joined with the Mammoth Cotton Co. in raising the wages of all employees 25c a day, dating back to Dec. 1. The increase is to last as long as copper is 25c or better.

Business in the San Francisco wholesale fruit and vegetable section this holiday season was slower than it has been in previous years, according to old-timers in Washington street. The high cost of living is thought to be the cause.

Judge J. A. Allen of the Superior Court of Visalia, in a recent decision, says: "Fruit under contract for delivery to growers' organizations may not be held by attachment when the producer fails to make deliveries in compliance with contract."

C. F. Door of San Francisco, H. C. Lewis of Porterville and E. L. Thompson of Los Angeles have purchased 2800 acres of the Wendling estate lands in Tulare Lake district, for which they paid \$478,000. The property is considered productive grain land.

With a membership of 350 persons, representing 11 county farm bureaus, the County Farm Bureau of Sacramento is preparing to take an active part in agricultural affairs following its organization. W. R. Klink, rancher and business man of Galt, is president.

Gov. Hiram W. Johnson sent a Christmas message of greeting and congratulation to the University Farm at Davis. It was addressed to Editor T. C. Judkins, Jr., of the University Farm Agricola, and expressed appreciation of the great work accomplished through this Farm.

It is generally understood that the Market Director will ask the Legislature at the coming session to pass such measures as will greatly enlarge his power along the line of enforcing standardization of food supplies. The measures will be opposed to farmers and produce handlers, it is thought.

Evidence that worthless alkali land can be restored to fertility by washing down the alkali through flooding, and preventing recurrence of alkali trouble by drainage and pumping, is given by the University of California in a "Preliminary Report on Kearney Vineyard Experimental Drain," just published by the University of California and obtainable free by writing to the College of Agriculture at Berkeley.

Nearly five million square yards of roadway, the equivalent of 561.9 miles of road 15 feet wide, were constructed under the supervision of Federal road specialists during the last fiscal year, according to the annual report of the Office of Public Roads and Rural Engineering, of the U. S. Department of Agriculture, just issued. This is more than double the mileage constructed in previous years, and include experimental roads, post roads, county roads, and roads in National Parks and forests.

Los Angeles county for 1916 raised 337,176 bushels of apples worth \$350,000; 22,319 tons of peaches worth \$450,000; apricots 5,000 tons worth \$120,000; grapes 13,613 tons worth \$250,000; oranges 4,664,753 boxes, worth \$5,925,000; lemons 752,227 boxes worth \$1,350,000; strawberries 1,768,620 crates worth \$1,000,000; hay 381,396 tons worth \$4,290,000; lima beans 11,890 tons worth \$1,150,000 and walnuts 99,521 tons worth \$995,000.

TULARE'S 8-TO-1 ORDINANCE STILL STANDS.

At a recent meeting of the Board of Supervisors of Tulare Co. to consider the proposition to repeal the 8-to-1 standard for oranges, at which a good attendance was present, Frank Rossire from the Upper Tule country said:

"In 1910, when I first came to this county, this county was shipping oranges so green that the desk blotter there would seem yellow in comparison with them. At that time the people of New York were so bitter against California oranges that

they refused to purchase them in the markets. When I announced my intention of coming to Tulare county and investing in orange land my friends and relatives said to me; 'What in the name of all that is good do you want to go out there and throw your money away for? Don't you know that California oranges aren't fit to eat?' And I replied that I believed that the conditions surrounding the picking, shipping and marketing of the fruit could be greatly improved and that I was in the mind of making a try at the venture. And to ask me just now, when we have accomplished what we were seeking most diligently, a market control that standardizes the fruit we ship out of this county in a way to win for it the highest prices on the markets of the East, to favor killing the goose that laid the golden egg by repealing the county ordinance that made this standard possible, is asking me to do something that will literally cut the price of my lands in half, and I refuse to acquiesce." The Board refused to repeal the ordinance.

THE STATE FARMERS' UNION.

Judging from the recent state convention held at Modesto, the Farmers' Union of California is entering upon a larger field of usefulness in this State. Over one thousand dollars was raised in one day of the convention for the purpose of putting an organizer into the field who will give his entire time to the work. A State marketing agency in the form of the California Farmers' Union, Inc., already doing business in San Francisco, will act as a clearing house and each county organization will appoint a marketing agent. With this definite program in view, the Union hopes to gather many members into its organization

during the coming year. President C. S. Barret of the National organization was the principal speaker of the convention. Stanislaus county initiated over 50 new members during the convention.

Livestock Facts and Fancies---XV.

[By the Editor.]

We hope readers will not forget the convention to be held in Los Angeles on January 18 and 19 by the California Swine Breeders' Association, as fully announced, with details of the program, on page 651 of our issue of December 9. Members' meetings will begin at 9 a. m. and at 10:30 the discussions will open and continue through the afternoon. At first breeding and feeding propositions will be considered, and at 1:30 p. m. will begin the features to which we desire to call particular attention, viz., discussion of these questions:

Why Prices of Swine in California Are Lower than in Oregon or the Middle States.

Why strictly grain-fed, milk-fed, alfalfa-fed, and acorn-fed hogs all bring about the same price in California.

It is expected that representatives of California packing companies will undertake to answer these questions; and as they are fundamental to the growing interest, the statements of authorized buying interests ought to give growers a better idea of how their product stands related to the trade. If we remember correctly this is the first time in this State that buying and growing interests have come formally to the discussion of matters which underlie the success of both. No doubt there will be some heart-to-heart talks which it will be edifying to hear. The fruit growers found out long ago that there was much to learn by conferences with representatives of buying and shipping interests, and their conventions usually include such features. The Swine Breeders have done well to try to get to the center in this way and they should be encouraged by a large assembly of those interested in the solution of puzzling problems.

Our readers all the way from Puget Sound to San Diego have told us of their difficulties in selling hogs. It seems to be a long coast problem, though possibly California has the worst end of it. It is discouraging and it leaves one of our greatest chances in industry only partly developed. How it acts sometimes can be seen by the following sprightly note which a Lassen county man sent recently to the Sacramento Bee:

When Chicago and Kansas City give 10 and 11 cents for hogs, the present Pacific Coast buyers give 7 to 9 cents. Now, give us 12 cents when Chicago says 11 cents, and conditions will be even, for it costs perhaps 1 cent a pound to get that thirty million dollars' worth of Eastern products here. Why not give us what you give the railroads when we do raise enough? Then we will take an even market.

One of my neighbors and I had a carload of as fine 225-pound hogs as ever walked. We wanted all they were worth. We tried to ship to a concern at Reno, Nev.

What was our answer? It was: "We have a buyer in your locality; we refer you to him." But we already knew Smith, a tip-top old gentleman, too. So we had to take 7 cents a pound for our hogs. And we have quit, just like hundreds of other farmers. Bankers would not lend us money to raise 7-cent hogs, and we would not borrow it either. But give us what hogs are worth;

then we will use their money and pay them back with good interest.

We are not prepared to affirm or deny the statements of this man. That is a matter for careful inquiry and wise talk, but we do know that there is so much that is wrong in the present conditions of producing and selling that growers do not get the money their hogs are worth or else they do not grow hogs that are worth the money they ought to have from an unsupplied local market in the face of very large importation. We do not answer the above letter, because we cannot, but we desire to use it as a prod to get growers who can to the Los Angeles meeting. If the promised discussion comes on, there will probably be some light thrown on such questions.

There is, however, one thing about it: if Pacific Coast growers think they are in foxtail and all others in clover they have another guess coming. The unsatisfactory condition and operation of livestock selling by growers is national. We gave last week a declaration of the recent National Marketing Conference in Chicago on that subject which we hope readers remember. And this conference concluded that something pretty strong is needed to cure present conditions in livestock selling. Here are a few other things the Conference resolved upon:

We urge upon Congress the making of an adequate appropriation and the giving of adequate authority to the Federal Trade Commission to enable it to cover all important phases of the problem of selling livestock, including the experiences of other countries with municipal abattoirs and co-operatively owned packing plants, all to the end that a free and uncontrolled market may be assured, that any existing abuses may be corrected, that present wastes may be eliminated, and that new methods may be adopted. We further urge that the fullest publicity be given to all facts affecting the prices of livestock received by the producer and the cost of meat products paid by the consumer.

This ought to suit the Lassen county writer. He is not the only one who knows there is a nigger in the woodpile who ought to be smoked out, and if Congress cannot do it who in this country can? That is what we urged some time ago that the Los Angeles Swine Growers undertake. Get a government inquiry started; not with any disrespect or injury to the African aforesaid, but for the sake of knowing what the matter is, and where it is.

Another point for the Lassen county complainant is that the trouble is neither local nor new. The National Live Stock Association has been at the front of the subject for years and they have fired some pretty big guns, but so far they seem to have been "repulsed with heavy losses." At the Chicago conference H. A. Jastro of California, president of the National Association and chairman of its Market Committee of the American Livestock Association, which has affiliated with it twenty-nine other of the strongest livestock producing and feeding associations of the entire Middle and

175—High Grade Holsteins—175

The complete Dairy Herd of The Gotshall Cattle Co., of Ripon, San Joaquin Co., Cal., situated on the State Highway, at Public Auction sale at their farm at

RIPON, ON THURSDAY, JAN. 11, 1917 will sell to the highest bidder, without reserve, their complete Dairy Herd, consisting of

65 head of the choicest selected high grade, finely marked, all young, 1st, 2nd and 3rd calf Holstein Dairy cows in this section of California.

90 head of extra finely marked high grade Holstein heifers from 10 months to 2 years old, a number of heavy springers in this lot.

25 head of Holstein calves. 2 finely marked young, high grade Holstein bulls. 2 registered Holstein bulls.

Dairymen and prospective purchasers note this, that this herd has been selected from the best they breed in the high grade Holstein line. Neither price nor care has been spared to get the best they breed, and the herd must and will be sold on the above date.

There are a number of heavy springers in the cows.

Terms can be made with the Gotshall Cattle Company at their office at the Bank of Ripon, San Joaquin Co., on or before date of sale. All terms and time agreements must be made before the sale starts.

The sale will start at 11 A. M. sharp on January 11th.

A nice lunch will be served at noon.

Far West, expressed himself thus: Pacific coast stockmen having interests identical with those of other states in trying to get unrestricted markets for their produce welcome the opportunity afforded by the Chicago Conference on Marketing to present to the American people the great need for consideration of their legitimate demands. They also believe that reasonable profits, based on adequate prices, are necessary for the preservation of the livestock industry and essential to the welfare of the nation.

Mr. Jastro is at the head of great range interests. We do not know how far his views and interests are aligned with or remote from those of the producers of farm stock. No matter how near or far he may be, we are merely using him, with due respect, as a trouble-chaser in this connection. If the Lassen writer and his "pardner" who have gone out on the backs of one carload of hogs and Mr. Jastro who stays in with thousands of carloads of steers, both see trouble in the present situation surely there is something which it is worth going to Los Angeles on January 19 to find out about.

JOTTINGS.

All sick animals should be immediately removed from contact with healthy ones, at least until the nature of the disease is known. They should be fed and watered from separate vessels.

Manure should not be allowed to accumulate inside the stable, as the inhalation of noxious odors in many instances causes an irritation of the air passages and renders them liable to coughs and colds.

The horse should be shod at least once every 40 days whether the shoes are worn or not, as the hoofs overgrow the shoes, this being the cause of inflammation of the feet and corns.

Six hundred and six head of Dur-

HOLSTEIN CATTLE

During the fiscal year ending April 30, 1916, there were reported to the Advanced Registry Office of the Holstein-Friesian Association, 11,868 short time official records, over one-half of which were by heifers with first or second calves. The average seven-day production of these 11,868 animals was 401.1 lbs. of milk, containing 3.53 per cent of butterfat. These figures emphasize the fact that Holstein merit is based, not on individual records, but upon the wonderful uniformity of high productiveness of the purebred Holstein cow. Sixty Acres for 150 Cows.

[Written for Pacific Rural Press.]

It is a mistake to try to replenish your dairy herd with outside purchases of fresh cows, in the estimation of Borchers Bros. of Sacramento county who have been running a large market-milk dairy for a long time, and who realized 12 years ago that the only sure and economical method of securing high-producing cows is to use a good bull and raise your own heifers.

Holstein bulls are the kind that have been in use, care being taken in later years to see that they were from high-producing ancestors. As a result of this practice, strings of 25 cows in their herd average 1,000 to 1,200 pounds of 3.3 per cent milk a day for nine months of the year in which green alfalfa feeding is possible.

Contrary to the general belief that only those heifers from the best cows should be raised, Messrs. Borchers raise every heifer, stating that many times a heifer from a mediocre cow will prove an exceptional producer; if not during her first lactation period, then during her second one. But they believe in culling, and sell a number of cows every year because they do not come up to the production requirements.

For the last two years they have gone still further in the matter of raising calves, keeping all the bull calves as well as the heifers. This was done with the idea of turning off beef steers instead of veal, the policy being to keep them till they are three years old when an average of \$75 a head is expected for them.

Naturally these steers are not fed such high-priced feed as the milking cows receive, but are run on cheaply rented pasture lands. This land is not used purely for steer pasture, 200 head of calves, steers, and dry stock being run on the same land, at a cost of \$500 for rent during nine months of the year. Except for skim milk and alfalfa, fed during early calfhood, there is very little expense connected with the steer-raising experiment.

The practice in raising heifer calves has been the same for years on this dairy; whole milk being fed two to four weeks, after which skim milk is fed with freshly-cut green alfalfa. If there be any question as to the practicability of raising calves on skim milk Mr. Borchers will

point to the size and vigor of his cows.

"Soiling" Their Alfalfa instead of making hay of it is another point on which Messrs. Borchers have very decided ideas. During the alfalfa growing season, which with them is about nine months of the year, all alfalfa is fed green directly after cutting. Two advantages are found in this system: (1) A milk flow equally heavy as when pasturing is practiced without the danger of bloat, and (2) a big saving in feed as the cows eat the green-cut alfalfa clean, while there is a certain amount wasted in hay feeding.

While the character of their sub-irrigated land has much to do with the yields of alfalfa, it is instructive to know that between March 1 and December 1, 1916, 60 acres of this sub-irrigated land furnished all of the alfalfa for 150 milking cows and 100 tons of hay were cut from the same land. It would have been impossible to carry such a large number of cows for such a long time on this land had either pasturing or hay cutting been practiced, thinks Mr. Borchers; and while it is true that more labor was involved, this is more than offset in the saving of feed.

Wet brewers' grains are fed in connection with alfalfa the year round, about six gallons a day being fed to each cow in her two feeds. This and green alfalfa produce more milk than brewers' grains and alfalfa hay as is shown during the winter months when alfalfa hay is substituted for the green alfalfa, at which time production falls off. But it would be still better, thinks Mr. Borchers, to feed brewers' grain, alfalfa hay, and green alfalfa at the same time; as cows are apt to get tired of alfalfa or any other feed in one form alone.

Like most all dairymen supplying whole milk to the city markets the Borchers experienced difficulties in selling to San Francisco distributors. As a consequence, they opened an ice-cream parlor and creamery in Sacramento last year; and while this has not solved all of their troubles, they are assured a regular market at better than distributors' prices. Even their buttermilk finds a heavy retail demand during the hot summer months at good prices.

Keeping Hogs Free of Lice and Fleas.

[Written for Pacific Rural Press.]

There are very few hog quarters where fleas and lice cannot be found at some time of the year, and in some instances hog profits are sorely reduced on this account.

At the Riverina Farm in Stanislaus county this condition is never allowed to arise for, according to Manager Johnson, "we can't afford to feed \$2.00 barley to a brood of fleas or lice."

Creosote and crude oil are the agencies depended upon by Mr. Johnson to keep both fleas and lice from the hogs and hog premises, the creosote being used as a spray for the side walls of the buildings and on the hogs. The latter work is done at feeding time, when spray-

ing is convenient on the backs of the animals.

To keep the fleas from infesting the floors of the farrowing and fattening houses, hot crude oil is applied to the wood and thoroughly mopped in. This and the spraying are done at regular intervals whether vermin appear or not, as it is the intention to prevent them rather than have to cure them.

The outside wall of a horse's hoof should never be touched with a rasp of file, as the covering (Periople) provided by nature is removed, thus permitting the penetration and absorption of filth that causes the hoof to become contracted and brittle, producing a predisposition to quacks.

"Gee! But I Have an Appetite!"

A cow that eats poorly usually milks poorly, and any poor milker is a loss. Lost Appetite is only one of the common cow ailments that quickly disappear after judicious use of Kow-Kure, the great cow medicine.

Kow-Kure has a record of over twenty years' success in the prevention and cure of such diseases as Abortion, Barrenness, Retained Afterbirth, Milk Fever, Scouring, Bunches, etc. Most of these diseases spring from disordered digestive or genital organs, and Kow-Kure has strong medicinal qualities which tone up and permanently strengthen the entire system.

A trial is convincing. Kow-Kure is sold by feed dealers and druggists, in 50c and \$1.00 packages. Write for free treatise, "The Home Cow Doctor."

THE PROPER USE OF COW-TESTING RECORDS.

[Written for Pacific Rural Press.]

While it is gratifying to know that over 20,000 dairy cows in the State are now being tested in cow-testing associations, an increase of approximately 15,000 head in a little over two years, it is disappointing to learn that many dairymen who have their cows tested in these associations are not getting the most good from the associations' records.

A case in point is related by the secretary of one association regarding a member who had to be dropped because he insisted upon entering his 30 best cows instead of his entire herd of 45 cows. His reason for doing this was that the monthly reports of the association, which are published in the local papers, showed his herd average to be high, due to his testing only the best cows. Thus he was enabled, if he so desired, to mislead the public into believing that his entire herd were high producers.

What he hoped to gain by this, other than the notoriety which could only be realized on through the sale of cows and calves, is hard to appreciate. The real truth of the matter was that he was damaging nobody but himself, for he was not using the association's records to improve his entire herd by breeding and selection, the fundamental purpose of cow testing.

Another practice which is far too general among members of these associations is neglecting to compile the monthly reports into a yearly report. This leads to a confusion of ideas about the production of individuals. Many times a cow's value is placed upon one or two months' work instead of upon the entire lactation period. The result is that many of the persistent cows are frowned upon as second class and their heifers not considered so valuable as those from cows with outstanding production for a few months but which drop off in their milk flow early in the lactation period.

Experienced members of cow-testing associations have learned that the chief value of the records is realized by using them as a criterion of how to breed and select for higher production in the offspring.

SALTING PORK.

To the Editor: For putting down pork for summer use how long should it be left in salt before smoking? Which is the best to use—fine or coarse salt?—L. B. T., Los Molinos.

Bacon and small pieces should remain in salt or brine about six weeks; hams and shoulders, seven or eight weeks. If the brine becomes ropy, remove the meat and boil the brine again. Wash with warm water and wipe dry before smoking. Coarse salt is more likely to be pure and cheaper, therefore preferable.

The old familiar saying: "If a horse has a broken leg, remove the shoe and examine the foot anyhow," should certainly be acted on to the extent that every lame horse should have the shoe removed and the foot thoroughly examined.

A mixture of equal parts of tinct. iodine, turpentine and sulphuric ether, applied once daily for several days, will stop the growth of new splints on animals.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

THE DAIRY.

J. E. Thorp of San Joaquin county advises us that he has two of his registered Jerseys on official test and that both of them hold promise of making the Register of Merit without difficulty.

Wisconsin produces more butter than any other state in the United States. Her farmers receive two-thirds of the price which the consumer pays for this butter, says B. H. Hibbard of Wisconsin.

State Market Director Weinstock, after investigation, reports that it costs on an average 15 cents per gallon to produce milk on the farm. It cost about 1½ cents a gallon to lay the milk down at San Francisco, making the total cost 16½ cents a gallon.

Dr. Williams of Cornell University, New York, visited in the neighborhood of Galt recently, where he lectured on abortion and sterility, etc., illustrating by operations on eleven head of cows. He was accompanied by veterinary surgeons from the University of California.

N. H. Locke & Co.'s Empress Lass, according to a late statement, produced 11,956 4 pounds milk and 637 pounds of butterfat in 311 days. The butterfat sold for \$197.99. The cost of all feeds, including pasture was \$70.79. This shows a net profit of \$127.20, besides two healthy calves, within the year, skim milk, etc.

F. H. Arnsburger, proprietor of the San Joaquin creamery and owner of a dairy farm near Lathrop, stated recently at a meeting of Stockton milkmen that it cost him on an average of 13½ cents a gallon to produce milk at his farm. He declared that he keeps accurate records for the purpose of deciding whether it is cheaper to buy his milk or produce it himself.

The Holstein-Friesian Association, through its superintendent, Malcolm H. Gardner, reports that the Holstein-Friesian heifer Nalad Jewel Pet 269082 has broken the record for fat production in the senior two-year class of the 7-day division, by producing in seven consecutive days 478.4 pounds milk containing 25.28 pounds fat. She is owned by Mr. Oliver Cabana, Jr., Elma Center, N. Y.

BEEF CATTLE.

The National Western Stock Show will be held in Denver, Colorado, January 21-27, 1917.

The twentieth annual convention of the American National Livestock Association is to be held at Cheyenne, Wyoming, January 18, 19 and 20. The proposed advance in grazing fees will be one of the very important subjects for discussion.

The Ormondale Co., breeders of Shorthorn cattle in San Mateo county, report the sale of three high-class Shorthorn bulls to W. Mayo Newhall of the Newhall Land and Farming Co. Among the lot was the bull Ormondale Victory, a yearling which was a likely show prospect.

Barney A. Benjamin, one of the best known men in the meat-packing trade in Los Angeles, for twenty-four years in the office of the Cudahy Packing Co. and for much of that time assistant manager, has resigned. He severed his connection with the Cudahy packing people last week, and will leave Los Angeles to enter the meat trade in Fresno, California, as head of the Universal Packing Co., a new organization.

R. M. Dunlap advises us that he will leave for the East shortly to fill the following orders for purebred beef cattle; a number of Hereford bulls, including a new herd sire, for the Simon Newman Co. at Newman, whose herd he formerly managed; a high-class herd sire for Ben Rush

of Suisun and two Polled Durham bulls for Jas. Hamilton of Exeter. Mr. Dunlap has previously imported cattle for all of these parties, including show cattle at various times.

At the International Livestock Exposition held at Chicago, December 2nd to 9th, Wilson & Co. gave the highest price ever paid for a carload of beef cattle in the United States. This was the grand champion carload lot fed by Ed. P. Hall of Mechanicsville, Illinois—15 head of Aberdeen Angus yearlings—of an average weight of 1146 lbs. per head; making a total weight to the carload of 17,200 lbs. The cattle were bid in at auction by Wilson & Co. at 28c a lb., the previous high record being 17c per lb. The price for the cattle averaged \$321.08 a head and the total cost of the carload was \$4,816.00.

SWINE AND SWINEMEN.

In a recent Arizona Boys' Pig Contest the honors and \$19 in cash prizes were won by a little girl—Mary May Pitts, 11 years old.

A recent shipment of 1300 hogs from Hanford to San Francisco averaged about 190 pounds in weight, and the price paid was from \$7.50 to \$8.50 per hundred, according to quality.

Land has been purchased and construction work started on a new pork packing establishment by the Moran Co. at South San Francisco. While smaller than the one there owned by the Western Meat Co., the plant will be modern in every respect.

J. C. Bruss of Tulare has received twelve head of Tamworth hogs from Palmer, Illinois, and plans to raise this breed of hogs on a ranch near Tulare. These hogs are from registered stock and premium winning sires. English bacon is made from this kind of hog.

H. E. Boudier reports some sales from his ranch near Napa, as follows, which he traces as a direct result of his advertising notice in the Pacific Rural Press: Duroc boars to Albert Joppas, Ferndale; Hiram Briggs, Healdsburg; D. W. Rogers, Gazelle. Duroc sows to A. Munk, Napa; I. W. Brown, Placerville.

SHEEP.

There was shipped out of New Mexico for the year of 1916 885,886 sheep and into the state 29,386.

The annual convention of the National Wool Growers' Association is held at Salt Lake City, Utah, Jan. 11, 12 and 13.

Two carloads of purebred livestock, including some fine specimens of Shropshire sheep, have arrived at the Butte City Ranch in Glenn county.

Andrew McInnes, a sheep man of Red Bluff, has just returned from the Northwest, where he bought 46 carloads of ewe lambs. He believes mutton is going to be scarce next year and is getting hold of all the sheep he can.

Roy D. Mayes, Dixon capitalist, has purchased 3,000 acres of land in Lassen county, with control of 50,000 additional acres, with the object of engaging in sheep raising. He bought 8,000 sheep with the property, and the range is sufficient to feed 10,000 head. The land is located about five miles from Susanville.

The feeding of 12,000 head of sheep under the new plan adopted this season by the Western Meat Company has been very successful at the yards of the Visalia Sugar Company. These 12,000 head will soon be shipped to market and more sheep brought in. The total feeding will take care of 30,000 head of sheep, it is announced, and will cost the Western Meat Company close to

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue, or if carried weekly for one year, 2½c per word.

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

MAKE BIG MONEY with our Big-type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months. 300 head, both sexes, all ages, reasonable prices. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare county, but address owner, E. E. Whitten, 610-A Security Building, Los Angeles.

\$60,000. Hay and beet pulp are being used in the fattening process.

The 1916 lamb crop of Nevada, brought the highest prices for lambs that has ever been known in that State. According to H. G. Humphrey of the Union Land and Cattle Company the lambs brought an average of \$5 each. About 600,000 lambs represented the crop in Nevada, making in round numbers a total of \$3,000,000 that was paid to growers for lambs alone.

MISCELLANEOUS.

"Systems of Accounts for Livestock Shipping Associations" is the title of Bulletin No. 403 of the United States Department of Agriculture.

The Imperial County Fair last week was a good success. Many creditable exhibits of livestock raised in the valley were on hand and attracted favorable comment.

The development plans of the Stanislaus Dairy Farms Company on the old Gray Bros.' ranch, between Oakdale and Knights Ferry, are well under way, and the first shipment of registered stock for the proposed big dairy will arrive from New York some time in February.

REGISTERED IMPORTED PERCHERON Stallion for sale cheap. Hewitt & Hewitt, Dixon, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT CO., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreets, or San Francisco banks. Office, 319 Underwood Building, 525 Market St., San Francisco.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

D. O. LIVELY, 216 Hobart Building, San Francisco, buys and sells livestock—any kind—any quantity.

New World's Record Cow.

Winnie Korndyke Cornucopia De Kol, owned by the J. S. Gibson Company of Williams, California, has just completed a yearly record of 31034.2 milk and 1200.99 of butter. This gives her second place in milk production; and she is the only cow to give over 31,000 pounds milk and produce 1200 pounds of butter.

We purchased her in October of 1915 at the Morris-McAlister sale. She was in very poor condition and we were unable to get her dry before calving.

Winnie freshened Dec. 22, 1915, at the age of 8 yrs. 8 mos. She started her year on Christmas day with 60 pounds and reached her high day on Feb. 12 when she gave 119.7 pounds. She went along nicely until the hot weather of June lowered her 12 pounds per day. During the summer months she was quite uniform in her production. We tried to use a light blanket to keep off the flies, but she was opposed to it and we had to let her fight the flies as best she could.

In the early part of November the

She was milked four times a day by our herdsman, John Self, and too much credit cannot be given him for the painstaking manner in which he cared for her every want.

She was sired by Aaggie Cornucopia Johanna Lad, who has 102 A. R. O. daughters and has the distinction of being the premier sire of milk-producing cows. He is the sire of three 700-pound cows. His son Aaggie Cornucopia Johanna Lad Jr. also has three 700-pound cows and is the sire of the present world's record milk cow, Lutske Vale Cornucopia, with 31239.5 of milk and 1000 pounds butter.

Winnie's dam is a 21-pound daughter of Korndyke Queen De Kol's Prince who has 87 A. R. O. daughters including one 35-lb. and three others above 30-lb. Korndyke Queen De Kol's Prince is also the sire of our present herd sire, Prince Alcartra Korndyke.

Winnie was bred July 6, 1916, to Prince Alcartra Korndyke and at the completion of her year had been carrying a calf over five and one-half

WINNIE KORNDYKE CORNUCOPIA DE KOL, California's Latest Contributor to Long-Distant Record-making History. Owned and Tested by J. S. Gibson Co., Williams.

heavy frosts killed all the green alfalfa and she fell from 70 down to 55 pounds in about ten days. Try as we would we could not find a substitute for the green alfalfa and as a result she gradually went down.

Though she calved in poor condition, during the test she gained over 250 pounds and now weighs over 1675 pounds. Had she been in good condition and calved a couple of months sooner, we feel that she would have made better than 32,000 for the year.

Feed.—She was fed a ration composed of oil meal, soy bean meal, cotton seed meal, ground corn, rolled oats, ground barley, wheat bran, beets, carrots, dried beet pulp, corn silage and all the green alfalfa and alfalfa hay that she would eat. She was a wonderful feeder; would take anything you would offer and never refused a meal during the whole year.

WATERPROOFED CANVAS.

To the Editor: I have a buggy-top made of canvas. To make it waterproof, I intend to oil it. Can I give the canvas a glossy appearance?—E. H., Amsterdam.

[Answered by W. A. Plummer Co.]

We suggest that the top in question be waterproofed with boiled linseed oil properly mixed with lamp

months, thus making the record all the more remarkable and equaled by no other cow.

Her records are as follows:

Days	Milk	Fat
Dec. 7	498.7	14.811
Jan. 31	3113.5	92.471
Feb. 29	3152.4	91.420
Mar. 31	3128.2	95.097
Apr. 30	2898.4	87.822
May 31	2972.6	81.449
June 30	2497.5	71.928
July 31	2573.3	81.831
Aug. 31	2488.9	77.405
Sept. 30	2314.8	74.764
Oct. 31	2338.2	75.524
Nov. 30	1939.1	72.910
Dec. 23	1118.6	43.353

365 31034.2 960.789
or 1200.99 of 80 per cent butter.

This butter record is highest on the coast according to Mr. Gibson; and both the milk and butter records are highest in the world for a cow of her age. Her 7- and 30-day milk records begun 40 days after calving are State records, as also for seven days 274 days after calving; also her 22.58 pounds of 80 per cent butter in 7 days 274 days after calving.

black. To obtain a gloss mix with a small quantity of good varnish.

Visalia wants a stock show. Officers of the Tulare County Stock and Swine Growers' Association will appear before the Supervisors at their meeting January 5 with a proposal that the county purchase a tract of land near the city limits suitable in size and location for holding stock shows.

Purebred Foundation for Market Hogs.

[Written for Pacific Rural Press.]

One of the old standing faults that many farmers find with the purebred hog is that his initial cost is too much for the average person.

An experience that clearly disproves this theory is shown on the Riverina Farm in Stanislaus county where three registered gilts and a registered Yorkshire boar were purchased three years ago for foundation purposes and where those four hogs have now multiplied into over 500 head, notwithstanding heavy shipments for both breeding and pork-making purposes during the past year.

The practice on this ranch is to keep only those animals of superior merit for sale as breeding stock, fattening the balance for the butcher, and in this way reducing to the minimum the percentage of poor breeding animals and increasing to the maximum the profits of the market herd.

There are about 400 acres in the ranch, but only 10 acres are given over to the hog lots exclusively, this acreage being divided into eight separate fields which facilitates irrigation in the summer and allows segregation of the various sized and aged animals at all times.

Pasturing is the rule, but in the winter months when the alfalfa is dormant, alfalfa hay is fed in racks, located in the various fields. In both instances self-feeders are used also, these being supplied with rolled barley, tankage, sulphur, charcoal, sulphur, and wood ashes.

To hogs that are being fattened, this ration is supplemented with a slop feed composed of middlings, molasses, and water. To pigs after weaning up to three months of age, a slop made in the proportions of two-thirds barrel of skim milk, one-third barrel water, one gallon molasses and six gallons of middlings is fed, with access to self-feeders as well.

Brood sows are fed differently at different times, care being taken before farrowing that they have a sufficient quantity of protein feeds. This is supplied by a ration of tankage, rolled barley and alfalfa. After farrowing the sows are fed the skim milk, molasses and middling slop together with rolled barley for three weeks, when they are gradually let down to the alfalfa pasture-tankage-barley ration.

During the time that the sows are suckling their pigs the pigs are also provided a slop feed in an adjoining pen, a creep separating the two pens so that the pigs can drink in a separate trough from the one used by the sow. By this method the pigs wean themselves at about eight weeks old.

Two styles of farrowing houses are being used, one for winter and one for summer, both being suitable for fattening purposes. One is a building 90 feet long, enclosed on all sides and provided with good ventilation through the roof. This is used both for farrowing and fattening purposes during the colder months, the partitions separating the 15 pens on each side of the building being movable, thereby enabling one to make the size of the pens correspond to the needs.

The summer farrowing and fattening house is built on the same plan except that it is open on both sides, allowing more air than the previously described one.

The enclosed house is the one most generally used for farrowing purposes as it is the aim every year to have the litters come between March 15 and April 1 and again between September 15 and October 1. This practice not only reduces the labor cost in caring for sows and pigs but makes for more uniformity in size of marketable hogs, a consideration which is of importance to all growers of market hogs. Even with this care in farrowing dates Mr. Johnson, who has charge of the ranch, finds it necessary to keep segregating the pigs into different sizes, in order that the larger ones may not crowd out the smaller ones.

With this care and feed the average litter raised from the 57 brood sows on the place has been between nine and ten. In part at least, Mr. Johnson places the credit of this high average on the motherly qualities of the Yorkshire sows, it being his contention that they are not only more prolific but better mothers also than other breeds of swine.

The average gain per day secured by this method of handling and feeding is about a pound a day from the time they are born till marketed, several carloads having been sold the past fall which weighed 175 to 225 pounds when they were eight months old.

Raising Hogs on Garbage.

[Written for Pacific Rural Press.]

With the exception of alfalfa hay, fed in racks in the corrals, and a little bran slop to the brood sows while suckling pigs, the 500 hogs of the Napa State Hospital are grown entirely on the garbage from the tables of the 2400 patients who are kept at that institution.

This garbage is naturally composed of various kinds of foodstuffs, but has good fattening properties as is evidenced by the fact that nine- and ten-month-old grade Berkshires dress on the average 200 to 210 pounds, all of them being butchered on the place for consumption by the patients. It is interesting to note in this respect that the hog lots sup-

ply all of the fresh pork needed in the kitchen; and just recently a smoke house has been constructed which permits the curing of hams and bacon also.

In the past, hay was fed in open racks in the corrals, but often the rains interfered with this method of feeding. To overcome this condition a rack with a long overhanging roof has been built, with hinged doors on the ends for filling. As completed, protection from the weather is afforded both hogs and feed; and as a result a good-sized bunch of hogs may be seen around this hay self-feeder at all times of the day.

THE RAREST OF HIS RACE

Manteca, "King of the Black and Whites, 187787, is one of the most grandly bred bulls of the breed. His sire is King of the Black and Whites, a son of Marion Walker Pietertje, a 31.63 pound cow and grandson of both Aabby Hartog Clothilde, and Mary Walker Pietertje, each with a record of over 31 pounds. His first 7 dams are over 30 pound cows, 4 of which have each produced 30-pound cows, that in turn have produced 30-pound cows each with a 30-day record of 125 pounds or more.

The dam of our young bull is Belle Segis Colantha, daughter of Belle Segis, a 31.60-pound cow, the 2d best daughter of King Segis. The dam made a record as a 2-year-old, of 17.84 pounds with first calf, and she is just good enough so that I will refund \$400 of the purchase price of the bull if she does not make 30 pounds or over next spring.

The first 13 dams in his pedigree average over 30 pounds. Where can you find better breeding than this?

This bull is a fine individual, more white than black.

PRICE \$1250.

Raising Poultry for Profit

HOW TO CHOOSE EGGS FOR HATCHING.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

The standard of eggs has now been raised all over the State to conform with the San Francisco market standard. So no matter in what locality the farmer or poultryman lives, if he wants to get his eggs in as first-grade eggs, and, of course, that means first price, they must weigh on an average 22 to 24 ounces to the dozen. These No. 1 eggs must also be of uniform size, shape, color, and shell texture. This is their ruling. Some people seem to think that because they may happen to have found a market where they can command No. 1 prices on colored eggs, that I am romancing. I only tell you what is true of general conditions; if you happen to find a good place to dispose of your product at a little better figure, all the better, the credit is due to you for finding the market; but don't forget that if everybody who is engaged in raising brown eggs were to ship to your select market, it would be flooded and eggs would soon drop. I also used to find a good market for my brown eggs and generously told my friends and that was what happened to me. So far as people wanting brown eggs, there are many who prefer them; I do myself. But we produce things for the majority, and the majority decides what shall be called first-class eggs.

Knowing what the market demands are, it is up to us to decide what we want to produce and then go about it the best way we know. In selecting eggs for hatching, the first thing is to choose eggs on the principle that "like will beget like." This is not always true, because nature does funny things sometimes, but it is a recognized fact that if you set rough, ill-shapen eggs that become pullets, they will lay eggs of similar shape.

So then, for producing chicks that will average No. 1 eggs, we should select eggs of uniform shape, strictly white, weighing not less than 22 ounces to the dozen, and of good shell texture. The shell texture is important because if the shell is thin and porous it is always in danger of being broken during the period of incubation, and the least varying in the temperature affects the thin-shelled egg, so that its chances of hatching are not so good as the others. I used to think that they would not hatch at all, but last winter, in discarding a great number of eggs from a batch we were about to set, the owner suggested that we try them out in a smaller incubator, which we did and found the theory was not correct for they hatched out almost as good as the other eggs, though we naturally had to be careful in handling them. But thin and thick shelled eggs ought not to be incubated together.

Nearly all varieties that lay a brown egg will come up to the weight. They are usually thicker through and not quite so long as the white eggs, and for that reason should never be set in incubators

with white eggs. There is another reason too, why they should not be mixed, that is the embryo does not develop at the same rate as the white eggs, therefore the hatch is always delayed for the brown eggs. This is one of the great reasons why people report poor luck with brown eggs, and tell you that their Leghorn eggs hatched fine.

To get good results set eggs of one color only in each incubator and treat them alike; then the hatch will come off in about the same time, provided eggs are not too far apart in age. If eggs two weeks old are set with eggs laid the same day the incubator is set, the newly laid eggs will always hatch several hours ahead of the eggs laid two weeks before. But if eggs are about same age, same size, weight, and color the hatch should come off in 24 hours.

Never Let Eggs Chill.—Now in saving eggs for hatching, care must be taken that they are never chilled. The temperature should not go below 50 nor higher than 70. It is always safer to cover them with a cloth or several layers of paper as a protection against both heat and cold. There is not much in turning. I have turned eggs and left them unturned and never noticed much difference, so I conclude it is just a matter of opinion, not fact, that eggs must be turned.

Tobacco for Lice.—One of our subscribers asks for definite instructions regarding the spraying of chickens with tobacco water for lice. I never heard of such a thing being done. In fact, spraying chickens with anything would result in failure, because the feathers would get the liquid and the lice would burrow down into the skin and evade it. The only way is to dip them in the liquid, holding them by the wattles with one hand and by the shanks with the other and push them through the stuff against the feathers. To make any success you must wet down to the skin and this is a poor time for such experiments—too cold. Choose a good hot day next summer and use Kreso dip No. 1. I don't know anything about tobacco personally, except that we used it years ago for a wash to kill lice on horses and cattle in spring. And I know we used five pounds of smoking tobacco to a wash boiler of water and boiled it in the water for a few minutes, then cooled it off and washed the cattle and horses. It killed the lice.

QUESTION ANSWERED.

Chickens Caught Cold.—My chickens developed colds, running at nose and eyes and some got pneumonia. Those with running noses I treated with patent medicine in nostrils and throat, bluestone in the drinking water, coal oil in the feed, bran or soaked barley, and they got well. But some of the fat ones, pullets that showed no signs of being sick, died sitting down; some fell lame in one leg and could not walk—never got any better. I also lost several turkeys the same way. I feed barley and bran, pumpkins and green barley, and they have range.—Mrs. S. B. E.

You have dosed your chickens and turkeys too much, and not given them sufficient nourishment.

Send For A Sample Of Calmade Graduated Poultry Fence

10 inches graduated in mesh from 1/2 inch to 1 1/2 inches then 20 inches of 2 1/4 inch mesh, topped by 4 1/2 inch mesh for the height of the fence.

The Fence Without a Sky Line

It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, large fowls can't climb it.

"CALMADE GRADUATED" Fence will not slip at the joints nor unravel when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or bend on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

39 Barclay St.,
New York, N. Y.

For chickens that get colds, the coal oil as a physic or as a cleanser for the nostrils is good, but to supplement that with bluestone and other crude remedies without a little extra good feed, simply means death to the chickens. Always feed plenty of good nourishing feed in places where there is any danger of pneumonia. Besides this, aim to keep them warm, and clean out every vestige of dirt. That is what you need to do now because this trouble is catching. Then give them all a little iron tonic and better feed. Barley and bran, without a little meat or wheat, is very thin rations; the fact is, your chickens would not have been sick if you had fed and housed them right. Feed them dry wheat at night and get them a little beef scrap or good commercial mash. This will build them up and that is the best medicine. Ten drops tincture of iron to a quart of water for a week will also help.

Poultry Breeders' Directory.

OUR BABY CHICKS are hatching every week now. Have you ordered yours? You know what you want and we think we can fill the bill—high quality, reasonable price, and prompt service. Won't you write us for prices and circulars describing our R. I. Reds, Barred Rocks, Black Minorcas, White and Brown Leghorns. We want your business and future good will—it takes a fair play deal to get that. Our hatchery is up to date and we reckon to know our business. Let's get acquainted. A postcard will introduce us. Roofden Poultry Ranch & Hatchery, Campbell.

S. C. WHITE LEGHORNS—McFarland strain. We have exceptionally fine stock this year to breed from—two and three-year-old hens, carefully selected—Hoganized. Our male birds are the very best. We are now booking orders for day-old chicks; can supply them by the hundred or thousand. All eggs from our own yards. First-class chicks guaranteed. Fraser Poultry Ranch, P. O. Box 40, Palo Alto, Cal.

BARRED PLYMOUTH ROCKS—COCKERELS—Cockerels—Cockerels—Yes, we have them; also Hens and Pullets—all bred from our Champion Winners at California's leading shows. Also hatching eggs. If it's Barred Rocks you want, get in touch with me right away. Have bred them exclusively for nineteen years. Send for Catalog. Chas. E. Vedden, Box 399, Los Gatos, Calif.

"FINEST HATCHERY IN THE WORLD"—Baby Chicks, White Leghorns, and Rhode Island Reds, settings, 100's 1000's, hatched right in our \$60,000.00 brick and concrete hatchery from our quality heavy layers. Reasonable prices. Stock, Hatching Eggs. Peblee Poultry Farm and Hatchery, Sunnyvale, California.

WHITE PLYMOUTH ROCK, White Leghorn Incubator Chicks. Breeding stock. Eggs high class. Scientifically bred. Awarded all first prizes. California State Fair 1916. Make your arrangements for 1917 delivery of chicks. Mahajo Farm, P. O. Box 597, Sacramento, Cal.

WANTED—A number of hot water incubators, Jubilee preferred, 200 egg capacity or over. 220-egg type, Hoganized, S. C. White Orpingtons and Sicilian Butchercocks, cockerels, hatching eggs and chicks. All information gladly furnished. M. S. Woodhams, San Mateo, Cal.

BABY CHICKS—From large, healthy, vigorous, heavy laying thoroughbred Single-Comb White Leghorns. \$10 per 100 \$2 per 100 when order is booked, and balance 5 days before delivery. I pay the express to your nearest express office. H. A. Schlotthauer, Exeter, Cal.

BABY CHICKS—Get some of our good strong youngsters but order as far ahead as possible. Hatches every week. R. I. Reds, Barred Rocks, Black Minorcas, White and Brown Leghorns. Write for circular. Campbell Poultry Ranch, Campbell, Cal.

McARLANE STRAIN White Leghorn Eggs. \$1.50 per 15, \$2.50 per 30, \$5.00 per 100, \$50 per 1000; chicks, 12c each, until March 1st, then 10c. Big plant, lowest prices, best stock. Catalogue free. Newton Poultry farm, Dept. 1, Los Gatos, Cal.

WHITE LEGHORN AND BROWN LEGHORN day-old chicks from healthy, vigorous breeders. "Chicks well hatched are half-raised." Will be pleased to send you our circular. San Jose Hatchery, 373 Meridian Road San Jose, Cal.

THE SANTA CLARA VALLEY HATCHERY solicits your orders for Fall and Spring delivery in 8 breeds of baby chicks. Order early and get the best. Jos. A. Bihn, Lincoln Ave., San Jose, Cal.

HATCHING EGGS from our "Bred-to-Lay" S. C. White Leghorns. Season opens Dec. 1st. The early hatch lays the early winter egg. Booking now. B. H. Dickinson, Dept. IV, Los Gatos, Cal.

COCKERELS—Some dandy birds in splendid shape. Barred Rocks, R. I. Reds, Black Minorcas. Very reasonable prices. Campbell Poultry Ranch, Campbell, Cal.

RHODE ISLAND REDS—Cocks, Cockerels, Pullets, Hatching Eggs. Blue Ribbon winners at last Oakland Show. Wm. Larm, 3915 39th Ave. Fruitvale, Cal.

INCUBATORS—For Essex Model Incubators at factory prices, write Geo. H. Croley Co., Inc., Poultry Supplies, 631-637 Brannan St., San Francisco.

BABY CHICKS (White Leghorns)—shipped on approval before remitting. No weak ones charged for. Schellville Hatchery, B. F. D., Sonoma, Cal.

DAY-OLD CHICKS—These chicks are hatched from our own flock of 8,000 Utility White Leghorn Hens. George Bros., Petaluma, Cal.

BARRED ROCKS—Grand lot of high-class breeding males and pullets for sale. Satisfaction guaranteed. G. E. Tobin, St. Helena, Cal.

WHITE WYANDOTTES—Blue-ribbon winners. Eggs \$2 to \$5. Chicks, pullets, cockerels. R. W. Stawetaki, Route 2, San Jose, Cal.

HATCHED CHICKS from Barred Rocks, R. I. Reds, White Leghorns. Good stock. Send for circular. G. L. Hawley, Madera, Cal.

EASTMAN'S BRED TO LAY Barred Plymouth Rocks, Chicks, Eggs, Cockerels. Fairmead Poultry Farm, Fairmead, Cal.

CHICKENS, DUCKS, GEESSE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, Cal.

WHITE ORPINGTONS EXCLUSIVELY—Limited number of pullets. Reasonable prices. L. J. Burke, Lemore, Cal.

TURKEYS, DUCKS AND GEESSE.

BOURBON RED TURKEYS and Eggs for hatching. My birds won all the honors in the Alameda County Poultry Exhibition in Oakland, 1914, and just as fine this year. A. H. Balmer, Alhambra Valley, Martinez, Cal.

THOROUGHbred WHITE HOLLAND TURKEYS. Toms \$5; Hens \$2.50. Old White Holland Toms, \$7.50. Pearl Guinea, \$1 each. E. A. McKinley, R. D. Ukiah, Cal.

HART'S BRONZE TURKEYS AND EGGS—Large reduction in price of stock. Order now for fall delivery. Free Circulars. Albert M. Frost, Clements, Cal.

WHITE HOLLANDS EXCLUSIVELY—Only high-class birds from prize-winning stock for sale. Rockwood Farm, 201, Route 6, Santa Rosa, Cal.

INCUBATOR OPERATION.

[From U. C. Bulletin by J. E. Dougherty.]

Before the hatching season, overhaul the incubators and get extra thermometers and wicks. Place incubators in a cellar for uniform temperature, and ventilate without drafts by having muslin over the windows.

Level the incubator with spirit level so that one end or side will not be warmer than the other.

Disinfect the incubator before every hatch by scrubbing, and drying movable parts in the sun. Before putting eggs in, spray the inside thoroughly with a 2 per cent solution of cresol or similar preparation. Vapors remaining will help disinfect the eggs.

Diseases, among which is coccidiosis, are transmitted to chicks from infected shells. The eggs should be disinfected by dipping them "fairly rapidly" in 95 per cent pure alcohol just before putting into incubator.

Use medium flame at first so that at the end of the hatch it may be turned down when the chicks are furnishing their own heat.

Clean the lamp after turning eggs. If cleaned before, oil coats the eggs and injures the embryos.

To be sure that the thermometer is correct, test it in water with a clinical thermometer by adding hot water slowly until the clinical thermometer registers 103 degrees. Then you can figure on the error, if any, in your incubator thermometer.

Temperature should be 102 degrees with the bulb-center level with the tops of the eggs. The disk which regulates the heat should be 1-16 to 1/4 inch above the opening in the top of the heater.

During growth of the embryo, it must absorb oxygen through the shell into the network of bloodvessels just inside the shell for the same reasons that human beings must have oxygen in their lungs. Like human beings, the embryos throw off carbon dioxide, and this must be removed. Insufficient ventilation will rob the chicks of vitality even though it may not prevent hatching. Panting of chicks after hatching is due not to heat but to insufficient ventilation.

The eggs dry down naturally during embryonic growth. To determine how much drying is natural, set some eggs under a hen at the same time the incubator is set, and compare the increase of the air cell.

Air provided for ventilation will cause excessive drying of the egg unless provided with enough moisture. Sixty per cent humidity is generally considered adequate.

If too dry, the egg membrane will whiten and become so tough that the chick may die, unable to get out of the shell even after it is pipped. After eggs begin to hatch, a light film of moisture or a few beads of water should appear along the lower inside edge of the glass of the incubator door. Moisture over the glass indicates too much moisture. Keeping the floor of the cellar well

BOURBON RED TURKEYS—Hens and Gobbles for sale. Edward Mulick, Willows, Cal. Inside edge of the glass of the in-

soaked is a fine way to keep the air in the incubators moist enough if no better way is provided.

Turning eggs is simply to prevent the embryos from sticking to the shells. Simple rolling is enough.

More people cool eggs too little than too much. But the object is to cool the eggs, not the incubator, so keep the incubator shut while eggs are cooling.

Do not let the tray project over the edge of the incubator, because projecting eggs cool more than the others.

Begin cooling on the seventh day. Gradually lengthen the cooling period daily because it takes longer when the embryos are older. They are cool enough when the small end of the egg placed against the eye feels barely warm.

Test the eggs for fertility while cooling on the seventh and fourteenth nights. Infertile eggs on the seventh day are clear with a solid dark circle about half their diameter and are good for cooking.

Fertile eggs on the seventh day have a distinct movable dark spot with dark blood vessels radiating in all directions, but the egg itself is reasonably clear. On the fourteenth day fertile eggs are opaque and nearly black. Dead germs on the seventh day contain either blood clots or blood rings and are cloudy. On the fourteenth day they either contain blood rings or streaks, or are translucent and cloudy.

After the last turning, do not disturb until the hatch is over. When all chicks have dried off open the ventilators wide, remove the egg tray and shells without allowing a draft, and wedge open the door with a match stick to harden the chicks, but keep the temperature up to 100 degrees. Darken the chamber with a cloth to keep the chicks from picking the droppings and each other's toes. After 24 hours, remove them to a brooder in a flannel-lined and hooded basket, not allowing drafts to strike them.

The Health Department of Los Angeles advises as to judging of turkeys: "The age of a turkey may be determined as follows, says a bulletin just issued: On young turkeys the scales on the feet and on the lower joint of the leg are smooth and glistening, having a bright color which harmonizes with the general color of its plumage. The posterior extremity of the breast bone yields under pressure, being easily bent from one side to the other. Old turkeys have rough feet and legs."

The leading poultry raisers around Los Angeles have formed a co-operative association with a capital stock of \$100,000.

SEEDS, PLANTS AND TREES.

ORDER NOW—Genuine Giant Crimson Winter Rhubarb. The choicest and earliest of all varieties, producing bountiful crops, when other varieties are out of market. Can grow between orchard rows with big returns. 30c each; \$1.50 per ten; \$10 per hundred. Mail orders booked now and shipped when desired. A. P. Baker, 1116 The Alameda, Berkeley, Cal.

LOOK! SEEDS! The wonderful Raisin City Climbing Musk Melon grows 6 to 12 feet high. Extra fine melons, 5 to 15 lbs. Just the thing for city people with small back yard. 12 feet square will grow enough for a family. Packet, 10c. Get yours now from originator. This ad will not appear again. H. Shumaker, Raisin City, Cal.

OLIVE TREES, Mission and Manzanillo. I have several thousand olive trees propagated for my own planting. Have more than I need and will sell surplus at low price. Write for quotations at once before they are all gone. F. E. Carson, 948 So. Figueroa St., Los Angeles.

SPECIALLY SELECTED ARIZONA ALFALFA Seed—the best there is—at wholesale prices. Shipping warehouses: Modesto, Fresno, and in Arizona. You save at least \$2.00 per hundred by buying direct. Send your address for sample and price. Bomberger Seed Co., Modesto, Cal.

CITRUS TREES—all leading varieties. Large line Lisbon, and Villa Francis, Lemon, and Washington Navel Orange Trees. First-class stock and clean. Special prices to dealers or to growers in carload lots. Randall Brothers' Nurseries, Whittier, Cal.

STRICTLY FANCY SEEDS—Alfalfa, Scarified Sweet Clover, Red Clover, Timothy, Ryegrass, etc. Fred Bulletin—Write for samples and prices. Ralph Waldo Elden, Central Point, Oregon.

OLIVES ARE OUR SPECIALTY—We offer for sale fine thrifty trees of the best strains of Mission and Manzanillo. Earliest to ripen; earliest to bear. If that is what you want, we have it. H. Detmers & Son, Exeter, Cal.

CELERY SEED FOR SALE—Dwarf Golden Heart variety. Produced from seed purchased from C. C. Morse & Co. Strictly fresh and clean. Price, per pound, \$1.50. James Mills Orchards' Corporation, Hamilton, Cal.

SWEET CLOVER—The best legume known for introducing nitrates into soil. A large-producing, non-bloating forage and hay crop. Stands alkaline conditions well. Seed 15c per lb. V. M. Shuey, Manzanar, Cal.

WALNUT TREES—Franquette, Mayette and Mammoth on Black Root; also Grafting Wood and Black Seedling Trees. Lowest prices. Mammoth Walnut Nurseries, Watsonville, Cal.

MISSION OLIVE TREES—Raised from my own bearing trees. This is the only sure way to get what one wants. W. A. Hayne, Box 461, Marysville.

FRANQUETTE WALNUT TREES—Grafted on Black Root. Vigorous stock at lowest prices. Ogden Bolton, Jr., Route 6, Santa Rosa, Cal.

ALFALFA SEED—Common 17c; smooth Peruvian, 22c; Hairy Peruvian, 30c; delivered. Wm. Stuthman, 1238 West Pico St., Los Angeles.

FOR SALE—Gold Dollar and New Oregon Strawberry plants, \$3 per M. D. B. Bannister, P. O. Box 185, Oakdale, Cal.

QUALITY TREES—Seedlings, 5c. Prunes, 10c. Walnuts, 30c. Cash Nurseries & Seed Store, Sebastopol, Cal.

WANTED.

WANTED—Young men and women to attend the Western Normal Courses—Normal and Academic. The Normal Course gives an adequate preparation for teaching, at a great saving in time and money. Academic course gives practical finish to education. Write for Bulletin "A." Western Normal, 524 E. Market St., Stockton, Cal.

ORCHARD SUPERINTENDENT SEEKS POSITION—Experienced in developing young orchards, and have made a specialty of almonds. Can assume charge of any-sized tract, being experienced in handling labor. Single. At present employed, but want to make a change. Box 420 Pacific Rural Press.

COUNTRY LANDS.

ALMOND LAND IN SACRAMENTO VALLEY—12 acres partly set to almonds—1 and 2 years old; also 2-year-old family orchard—cherries, plums, apricots, pears, peaches, prunes, figs. Fine bungalow and other improvements; three-quarters mile from one town; one and one-quarter from another, 4 from another—all live railroad towns. Not only best almond and prune land in the valley, but ideal for vegetables, corn, Irish and sweet potatoes. Irrigated with gravity system. Price \$3200. \$750 cash, balance 9 equal payments, 6 per cent interest. Deal with owner and save agent's commission. T. J. Myers, Gerber, Cal.

DAIRYMAN'S GREAT OPPORTUNITY—I own the finest improved and equipped 400-acre dairy ranch in California. Not far from San Francisco. 60 tested cows with five years' secured sale for milk at 20c per gallon. Only those either owning 100 first-class cows or with enough money to buy, with experience and first-class references, need apply. Will rent on shares. Cannot take care of it, my time being taken up with other business in San Francisco. State full particulars in first letter. Box 430, Pacific Rural Press.

\$22,000—Fully equipped 80 acres alfalfa dairy ranch near Modesto. Yearly milk contract. Income \$600 per month. Can be increased to \$1000. Everything included except dairy stock, which can be bought separately. Address Box 400, Pacific Rural Press.

FOR RENT—Dairy Ranch, near Tulare, 400 acres, with 120 acres in alfalfa; splendid opportunity for right party. Will sell herd of cows, horses and hogs, if desired. Otto Grunsky, 410 E. Market St., Stockton, Cal.

HUMBOLDT STOCK RANCHES—CATTLE—Cattle correspondence solicited. C. E. Robertson, 105 Montgomery St., San Francisco.

FOR SALE—In Fernley Valley, 80-acre dairy farm, well stocked and improved. Price, \$14,000. Address O. P. McGarr, Fernley, Nevada.

WANTED TO HEAR from owner of good ranch for sale. Send cash price and description. D. F. Bush, Minneapolis, Minn.

Mrs. Best's Letter.

My Dear Friends:

If any of you number among your friends a woman to whom the stork is about to make a visit, a stork party would be a nice compliment to her. Only close friends are asked and they are expected to bring gifts for the prospective arrival. These can range from celluloid rattles to articles of wearing apparel or dainty bedding for the crib or bassinet. Small cheesecloth comforts, tufted with yarn and bound in sateen, are useful, and eiderdown squares, bound in ribbon, are both warm and pretty to look at. A mother can hardly have too many of such articles.

While a baby is under six months a bassinet makes an ideal bed for him, for they come on stands so there be no unnecessary stooping in caring for him, and the basket can be lifted and carried from room to room without handling the child at all. For long rides in a machine, the bassinet works like a charm, for it can be placed on the floor between the seats and the baby is just as comfortable as if he were at home.

As the child grows older, the bassinet is not large enough, and for that time in his life there is a wonderful new crib, playhouse and sleeping porch combined on the market, called a cariole. This looks like a generous-size child's bed, except that it is made of fine wire netting, set into a frame. There is a spring and mattress, and the whole thing is put together with pins so that it can be taken apart and packed into a compact bundle, and covered with canvas for moving. There are wheels on this crib, so it moves readily from room to room. The weight is about twenty pounds. I had the pleasure of seeing one of these in use in a home at Christmas time, and and it seemed ideal to me. The baby slept happily in it, then when awake, sat up and played in it without any danger of falling out or of picking up undesirable things from a not too clean floor. The ease with which it could be moved made it possible to have the baby in any room the family were occupying, and at night it was carried up stairs, and the child safely tucked into it. A canvas cover comes with the cariole that covers the top and makes an ideal sleeping porch in warm weather to use on an outside porch without trouble from flies.

In this same household I saw an old commode that had a hinged box set on top for all the articles used for the baby's bath. This had been painted white, and had good rollers so it could easily be moved from place to place, and it seemed to me must do away with much unnecessary walking.

A heavy linen bag, lined with oiled silk, was ready for damp diapers, when the child was away from home.

Certainly, with a little money and ingenuity, many conveniences and comforts for both mother and baby can be acquired. Rosabella Best.

METAL HOT WATER BOTTLE.

These cold nights make a hot water bottle very useful and the new metal ones are very satisfactory. They do not spring leaks just when most needed and have cotton flannel bags to cover them.

THE HOME CIRCLE

TAMALE PIE.

Cut 1 pound of beef and 1 pound fresh pork into $\frac{3}{4}$ -inch cubes. Put in stew pan, cover with 6 cups boiling water, and let simmer until tender. Cover 12 red peppers with boiling water; cook until tender, drain, remove seeds, and force through a fine strainer. Add pulp to meat, 18 whole ripe olives, 3 cloves of garlic, and 1 small onion, cut fine. Thicken gravy with 4 tablespoons white corn meal, cook 15 minutes, season with salt, cayenne, chili powder, and Spanish pepper. Put $\frac{1}{4}$ cup each lard and butter in sauce pan, add 1 teaspoon salt, and 2 cups boiling water; stir in slowly 1 cup white corn meal and cook until thick. Cool and line two-quart round baking dish with meal mixture. Pour in meat mixture, and garnish top with thin round pats of meal mixture. Bake one hour.

FIG PUDDING.

Editor Home Circle:

I have had success with this pud-

or other lean trimmings.

There are numerous ways to compound pork sausage. Lean pork trimmings, or the same with a small amount of fat added, or combinations of beef and pork trimmings, may be used, with varied selections of spices. The meat is first run through a chopper with a one-fourth inch plate. It is then spread out and spices sprinkled over it, and thoroughly mixed. To insure a more thorough mixing it may again be run through the chopper.

Spices may be selected to suit the occasion, or the taste of the sausage maker. The spices used, and the amount for one hundred pounds of meat, are as follows: Salt $1\frac{1}{2}$ to 3 pounds; saltpeter 1 to 3 ounces; sugar 5 to 10 pounds; ground white pepper 8 to 10 ounces; sage, rubbed fine, 4 to 12 ounces; mace $\frac{1}{2}$ to 1 ounce; garlic 1 to 2 ounces; coriander 3 oz.; onions 4 to 8 oz.; black pepper 8 oz.; mustard seed 2 oz.; ginger 2 oz.; nutmeg $\frac{3}{4}$ ounces, etc.

From the above list any desired

THE HELP THAT COMES TOO LATE.

'Tis a wearisome world, this world of ours,
With its tangles small and great,
It's weeds that smother the springing flowers,
And its hapless strife with fate.
But the darkest day of its desolate days
Sees the help that comes too late.

Ah, woe for the word that is never said,
Till the ear is deaf to hear,
And woe for the lack to the fainting head
Of the ringing shout of cheer;
Ah! woe for the laggard feet that tread
In the mournful wake of the bier.

What booteth help when the heart is numb?
What booteth a broken spar
Of love, thrown out when lips are dumb,
And life's bark drifteth far—
Oh! far and fast from the alien past,
Over the moaning bar?

Age, baffling most in the gray old world,
With its tangles small and great,
Its lonesome rights and its weary days,
And its struggles forlorn with fate,
Is that bitterest grief, too deep for tears,
Of the help that comes too late.

—Margaret Sangster.

ding and offer it to the Rural Press readers: 1 large cup dried figs, 1 cup blanched almonds put through food grinder; 4 eggs, yolks and whites beaten separately; $\frac{1}{2}$ cup lard, $\frac{1}{2}$ cup butter worked into two cups of granulated sugar; 3 cups flour, 2 large teaspoons baking powder; $\frac{1}{2}$ teaspoon each of cinnamon, allspice and ginger, $\frac{3}{8}$ cup ground chocolate. Mix flour, spices, chocolate, sugar, fruit, nuts, and baking powder thoroughly; then add eggs, $\frac{1}{2}$ cup rich milk, 1 tablespoon vanilla, the juice of three oranges, and stir up quickly. Steam two hours and bake 40 minutes.—Mrs. W. J. Y., Turlock.

PORK SAUSAGE ON THE FARM.

In making sausage, only clean, fresh meat from healthy animals should be used and this meat should be thoroughly chilled after killing the animal. Meat for sausage is generally taken from the shoulders, neck, and other lean trimmings, and pork fat is taken from the neck or back. In case beef is added, it may be taken from the cheek meat, neck,

selection may be used. When beef is added it is generally used in proportions of 20 per cent beef and 80 per cent lean pork trimmings. Some prefer more beef and make the proportion 45 per cent beef to 55 per cent pork.

Pork sausage may be stored in earthen jars or crocks and covered with a layer of lard, or it may be stripped into casings made from the small intestines of the hog. Casings can generally be purchased from the butcher shops ready for use.—H. S. Eakins, of Colorado Agricultural College.

COOKING SUGGESTIONS.

For use on fish, add tomato catsup to mayonnaise dressing until a pretty pink, and then add chopped parsley.

Tomato juice is fine for removing stains from the hands, as well as fruit and wine stains from linen.

A wire egg-beater is better for the whites of eggs than the Dover.

If the cream is too thin to whip, add the unbeaten white of an egg and whip cream and egg together.

Floral Department.

By Geo. N. Tyler.

Continuing on Leaf Mould.—It is good for young and soft-wooded plants generally, such as heliotropes, perlargoniums, begonias, coleus, etc. It is exceedingly useful, both by preventing the consolidation of the soil; and as a manure, as it is a natural plant food. The accumulation of light earth found on the surface in woods, where the leaves fall and decay annually, especially under oak trees, is leaf mould of the finest quality.

Composts are mixtures of the foregoing ingredients in varying proportions and in combinations with manures, if necessary, so as to suit particular plants or classes of plants. In making up composts for pot plants the fibrous portion should not be removed by sifting, except for small-sized pots, but the turfy portions should be broken up by hand and distributed in smaller or larger lumps throughout the mass. When sifting is done the fibrous matter should be rubbed through the meshes of the sieve along with the earthy particles. Before being used the turfy ingredients of composts should lie together in a heap long enough for the roots to die, but not to decompose.

Manures.—These are of two classes—organic and inorganic; the former being of vegetable and the latter of chemical origin. Horse dung is generally the principal ingredient in hot beds, and in its partially decomposed state it is well adapted for garden use. It is most beneficial on cold, stiff soils. It should not be allowed to lie too long when fresh, as it will then heat violently, and the ammonia is thus driven off. To avoid this it should be turned over two or three times and well moistened. Cow dung is less fertilizing than horse dung, but being slower in action is more durable. It is also cooler, and therefore better for hot, dry, sandy soils. Thoroughly decayed, it is one of the best of all manures for mixing in composts for most pot plants.

Bones ground fine, making bone meal, is one of the best fertilizers for lawns, roses, and also for potted plants. One half-pound to the square yard for garden purposes, and about one level teaspoonful to a five-inch pot full of soil is the right proportion. It is slower in action and more lasting. The effects of bone meal are no doubt due to the phosphates it contains, and it is mostly effectual on dry, sandy soil.

Guano is a very powerful stimulant, but I do not advise the use of it as it is too caustic, and unless it is judiciously used, will do more damage than good.

PIGS IN BLANKET.

Three cups sifted flour, 2 heaping teaspoons baking powder, $\frac{1}{4}$ teaspoon salt. Sift together, and rub in 2 tablespoons shortening; add enough milk to make soft dough; roll out about one-half inch thick, and cut out with large biscuit cutter. Take small, link pork sausage and partly fry. Place a sausage on each biscuit, roll over half and pinch edges together. Brush top with melted butter and bake like ordinary biscuit. Serve hot.

RATHER HARD.

They gave him whistle and a drum, Two big tin tops that buzz and hum, A ninepin set, some squeaking toys; Then said, "Now Tom, don't make a noise!"

They gave her paints, a sewing-box, Four dolls and stuff to make their frocks, A set of books with pictures gay; Then said, "Now, Madge, run out and play." —St. Nicholas.

THE GIFT OF VALUE.

By Frances Harmer.

Perhaps it was not a good thing for Edna Wilson that she should be so markedly set apart from the other girls who lived in the little town that looked up to her father as its greatest man, but there seemed no help for it. He was richer and more powerful than any one else,—and he was perhaps more public-spirited. Naturally, since he was a power with the grown-ups, Edna, if not a power, was at least distinguished among the girls.

She went to the same school; she did not dress so very much better, because neither her father nor mother thought it best for her. It was impossible not to get her good clothes, but they were not strikingly superior to those worn by her companions. In fact, the difference between her fortunes and the fortunes of the other girls was chiefly shown in one way,—in the gifts she was able to give them,—always so much richer than any they could give her.

However, one day, there came a change. It happened in this way:—

Mr. Wilson had received some exceptionally fine oranges from Florida. Edna, accustomed to lavish giving, immediately asked for some to take to her class, for the morning recess. Permission accorded, she tripped lightly to school, with the basket, in the hands of a colored man, following her. Two oranges were laid with a smile on the principal's desk. One was proffered to each teacher. At recess Edna handed round with a smile.

"Oh, thanks, thank you—thank you ever so much," came in a chorus from eight of the recipients—nine in number. The ninth was Alice Gilmore. Alice had a vocabulary, knew it, and liked to employ it.

"You're a perfect Lady Bountiful, Edna," was her way of showing gratitude.

Florrie Miller looked at her with envy.

"I like you to say things like that out here, Alice," she remarked, deftly peeling her orange. "But please don't mention that before Miss Carteret. She'll immediately pounce on us for the origin of the phrase."

"Well, I wish she would," retorted Alice, her nose in the air. "I'd soon tell her that the lady of the manor (in old English days) who distributed bread and things to the poor was called the 'Lady Bountiful.'"

"Oh!" said Florrie. "Then I don't mind if she asks us!" Nearly everybody laughed, including Edna, whose dainty head was perhaps a little higher.

"Lady Bountiful," said Peggy Chester, in a low tone. It chanced that the carriage called for Edna that day, so that no one walked home with her. Usually she was attended to her gate by a little court. As the girls, at the school gate, saw

her drive away, and waved their hands in answer to her gracious bow and smile, Peggy turned and faced them.

"Go right back," she said imperiously. "I want to talk to you."

When Peggy, who was small and determined and authoritative, spoke in that way, the eight obeyed her. They did so now, and sat under the tree at the back of the schoolyard.

"Do you realize," began Peggy, her dark eyes flashing, "that we are receiving charity—charity—from Edna? She is a Lady Bountiful, and we're like the English poor—in olden days. We take her gifts, and"—

A chorus interrupted her. She had sown the dragon's teeth and raised up warriors. The nine went homewards, all talking at once and all talking loudly.

Fortunately for their smarting feelings, Edna's birthday was at hand. It was the custom of the nine to put a quarter or fifty cents to a common fund, and buy whatever appeared most appropriate as a class-offering.

This time, under Peggy's leadership, they begged money from parents, they mortgaged their own future birthday gifts, and asked for what its purchase would have cost now, in hard cash—they even worked to earn money. Then, instead of sending a common gift, "As if we were not individuals," cried Peggy—they each chose a present in many cases as costly as the class offering had been. Edna was astonished—so were her parents. Moreover, they began to bring her tributes at lunch time, fully as costly as her own, until the result that they desired was achieved; namely, the little heiress learned that they desired no patronage and no charity.

After this her own gifts became more sensible, and theirs could equal hers without effort. Probably some wise grown-ups contributed to this result. However, gift-giving became almost normal.

Almost, not quite. Christmas gifts were not in excess of the occasion, nor birthday tokens. But a fancy for somewhat extravagant "Commencement presents" came into vogue, and, as this year was graduation year for their class, they all felt the need of making some special effort. True, Edna had learned that she was one in a republic,—that her wealth did not entitle her to give herself Lady Bountiful airs,—in fact, the nickname had clung to her until she had lived it down,—but they all felt that this year she would probably outdo herself. So, two months before Commencement day, the graduating class began to worry over the graduation presents.

They began saving pennies and earning them. They began sending for strange catalogues!

Then something happened that made poor Peggy wish she had never interfered. Her democratic spirit proved a boomerang.

Two months before Commencement, the relative who sent her widowed mother the tiny income on which they lived died suddenly, leaving his affairs in confusion. The income ceased. Peggy's brave little mother took in fine sewing. Peggy wanted to leave school at once and find work; but that would have made her mother too unhappy, so she aban-

"John, I haven't missed my cup of Ghirardelli's Ground Chocolate for forty years."

Ghirardelli's Ground Chocolate

is used in more than a million
homes in the West.

It comes PROTECTED—as all chocolate
should—in ½-lb., 1-lb., and 3-lb. hermet-
ically sealed cans.

Since 1852

San Francisco

doned the idea. After all, it was but for two months.

For about three weeks stern necessity, and many studies, kept Peggy from worrying over minor grievances. Then came a thought of the Commencement,—nay, more, the graduation presents! She could, as she said with a bitter little laugh give "nobody nothing!" Peggy was a sensible girl, but it wasn't pleasant to think of the presents she would inevitably receive, and the none—or next to none—she could give. For a time she decided frankly to give none of any sort, but that seemed too blunt. No, she must do her best and make some little token for each of the nine dear friends she cared for so well.

Three weeks before Commencement her mother was taken ill. Peggy did all the work, nursed her mother splendidly, and went to school only because her presence at home during school hours actually sent her invalid's temperature up—or so the invalid declared.

Fortunately, she had worked so well during the year that no cramming was necessary now. So she had time during the long evenings to work at her tiny gifts. For Edna she did a little water color on a postal. For Florrie she crocheted six buttons. For Alice she made a pretty hair ornament out of a tiny bit of white feather and a scrap of white silk. The other gifts were in proportion. And at last they were all ready, wrapped in white paper, and addressed.

Two days before the Commencement festivities Mrs. Chester was taken worse. It happened to be in

the middle of the night. Peggy, finding her own skill of no avail, rushed out to call the doctor, who lived not very far away. As she stood on his doorsteps, ringing frantically at the bell, she saw a strange red gleam through the cracks of a door a little further down the street. She was in too much anxiety about her mother to take in the significance of the red gleam, which, however, registered itself on her subconsciousness. When the doctor had started at a run for her home, the red gleam forced its way to the surface of her mind, and she turned back. The doctor would do all that human skill could do for her mother; her duty lay clear before her. It was agony to do this, for the child loved her mother passionately; but on she went, and rang the bell of the front door. In a few moments she had them all astir! In a few more she had given the alarm on either side. Then, unaided, she dragged the ladder from the back yard and held it while the mother of the family crept down it, carrying her six weeks' old baby. The father, above, lowered the children, and then, coming down himself, broke the ladder!

"All safe," cried the mother, drawing her children to her. "What does anything matter, if you are all safe!"

Just then there appeared at the window from which they had come a little black head, and a plaintive, though energetic, little bark implored that the doggie of the establishment might not be left to perish.

The father, in great distress, ran round to a neighbor's for another ladder. One was brought; but it was so slight that he, a heavy man, dared

not ascend it. The rapidly gathering, half-clad crowd urged him to think of himself, and the plaintive barking went on.

Peggy could not stand it. She placed the ladder against the wall, and before any one could stay her was half-way up it! They cried, they besought, and at last they busied themselves holding the ladder firmly against the wall, while Peggy reached the little dog, and, clasping him in her arms, began the descent. When she reached the ground, she felt for the moment as if she must faint, and then the thought of her mother seemed to bring her strength and calm. She slipped from the crowd, now augmented by the fire department, and ran home.

For one terrible moment she was half afraid to enter. Then she pushed open the door.

"Mother!" she said.

The doctor turned round and held up a warning finger.

"Hush," he said. "She's asleep. She's doing well."

Peggy began to cry. The doctor looked at her in surprise.

"Come, my child, control yourself," he began—and then he saw the red light beyond the door.

"They're all right, too," sobbed Peggy. "I told them in time." The doctor looked at her, a light in his eyes.

Then he gave her some water, and bade her lie down beside her mother.

Twenty-four hours later the excitement caused by the fire had died down. But the story of Peggy's rescue, first of the family, by her warning, and second of the dog, by her courage, had spread, and probably grown! At any rate she found herself a heroine.

In nothing was the estimation in which she was now held shown so strikingly as in the reception of her gifts. Edna, as well as the others, had surpassed themselves.

"Yes, they're lovely; but, oh, see what Peggy gave me!" was heard on every side. Edna, kissing her, said that the postal was to have the most beautiful frame Boston could show. Alice declared that her ornament was to be worn at her first real grown-up party! Florrie's mother promised that a fine white linen dress should be made for the crocheted buttons—and so on till every gift had been almost enshrined by its recipient. Edna's presents to her class-mates—really valuable pearl pins, all alike—were taken as a matter of course, and, like every other gift, thrown into the shade by Peggy's.

"Just think how they like those simple things," she said to her mother.

"Ah," said Mr. Wilson, to the proud and happy mother, "if the giver be of value, so is the gift."

He turned to Edna, and the other girls, who were all looking half wondering at Peggy,—

"My children, try each of you, so to live that your gifts are of value because of the value of the giver!"

Good Health.

[By H. E. Pastor, M. D.]

What the Eugenist is After.

Nature knows no sentiment, at least she knows no sentimentalism, if we may draw a distinction between these somewhat similar words. She is moved by no sense of pity for the weakling, be that weakling plant, animal, or human organism. In the primitive development of the human race, nature weeded out unrelentingly those who were too weak to take care of themselves and hold their own in the general struggle of life. We see this tendency illustrated in the habits of the lower orders of animals today. Throw a dog a bone, and he will growl and snarl and snap at any other animal which approaches close enough to be suspected of having designs on his precious morsel of food. It makes no difference that the other dog looks lean, hungry or sickly. Pity has no part in the dog's moral make-up. Superior strength in another, and that only, will cause him to relinquish his prize. The dog is merely a type of the brute creation. A cat or any other animal displays the same callous, uncompromising selfishness under similar circumstances. And so it was with the human animal until within comparatively recent times, developmentally considered. But since man has become civilized he has developed traits unknown to his prehistoric ancestry. The qualities of mercy, pity, charity and kindred altruistic sentiments have appeared, and virility has ceased to be the test of survivorship. The science of medicine, with its elaborately equipped hospitals, prolongs the life of the sickly; surgery strives to straighten out the deformed, we have insane asylums for the demented, "homes" for the feeble-minded, prisons for the morally depraved, almshouses and charities of all sorts for the ne'er-do-wells, and down and outs; and the maintenance of all these constitute a heavy tax on the balance of society—the physically and mentally fit.

Pity Puts Us on the Toboggan.

And yet no one is inhumane enough to stand forth and say that these humanitarian institutions should be abolished, and the sickly, weak and helpless—the lame, the halt and the blind—be left to shift for themselves and fall unaided in the effort at self-perpetuation. But that the tendency of permitting our charitable impulses to go on unchecked results in a progressive increase in weaklings and dependents in our midst and that it tends toward racial degeneracy, becomes more and more obvious to the reflecting mind.

The Problem Solved All But—

And now steps forward our eugenist with his solution of this very knotty problem. He says: Let us do what we can for our more unfortunate brethren and sisters. It is a Christian and humanitarian duty, but it is also a duty we owe to posterity to see that helplessness and imbecility and disease are not transmitted to future generations, and therefore only the physically and mentally fit should be allowed to propagate their kind. How this may

Wouldn't You Like to Have a Row of WISTARIA Like This?

Wistaria is one of the most graceful of climbers; a quick, vigorous grower; surpassed by no plant for covering walls or piazzas. Its rich, pendulous, panicles of pea-shaped flowers appearing in spring in great profusion render it one of the most desirable of deciduous climbing plants.

We can also supply Ornamental Trees, Shrubs, etc., of almost every kind.

Genuine Army Shoes for YOU

Made from the strongest and very finest prime calfskin leather on earth—genuine Indian tan—Goodyear welt—heavy soles and bellows tongues—soft and velvety feeling to the feet. These shoes are made over the lasts and patterns designed by Edward Lyman Munson, A.M., M.D., of the Medical Corps of the United States Army, and approved and adopted by the War Department. This is the shoe on which we were awarded a contract for making 150,000 pairs for the Government. This is a real outdoor shoe for farmers, stock raisers, fruit growers, hunters, hikers, campers and general outdoor service; made for perfect comfort and long wear. Our name is stamped on every pair.

Order No. 202 R Tan Army Shoe.

Only \$6.00

If not sold by your dealer, order direct from us. A new pair or your money back if they do not fit.

be done best and most effectively—and no well-balanced mind will deny the propriety of some such step—is the purpose of the present eugenic discussion. Society needs a citizenry that can make its way in the world

without crutches. If good breeding is important in dairy stock, beef stock, swine stock, etc., it is a thousand times more important in human stock. But how control the marriage matings—there's the rub!

SAN FRANCISCO.

San Francisco, Jan. 3, 1916.

WHEAT.

The Chicago market has taken quite a jump this week, and there is a slightly firmer feeling on the Coast, though no advance. The trade, in fact, has not recovered from the holiday dullness, and there is hardly any movement, though a good deal is arriving from the north. Very little remains in growers' hands here, but there is still a fair supply in the north.

[First-hand prices on strictly first-class grain, San Francisco.]
 Sonora wheat\$2.75@2.80

OATS.

Seed oats are cleaned up, though some Texas reds are expected to arrive. Feed is in fair demand, with white slightly easier on liberal arrivals.

Red feed 1.80@1.85
 White 2.05@2.10

CORN.

A little Eastern yellow is arriving for the mills, but there is none offered on the local market. California yellow shows a narrower range, with a little more inquiry than before. Milo and Gyp corn have been marked down on account of large offerings of poor grain, though the demand is active.

[First-hand prices on strictly first-class grain, San Francisco.]

 California 2.10@2.20
 Milo Maize 2.00@2.20
 Egyptian 2.20@2.25

BEANS.

Except for a little shading of black-eye prices, all quotations remain as last reported, and business has not yet recovered from the holiday dullness, which will probably continue for another fortnight. Quite a large order for pink beans was recently placed by the Government in the south. Tepary beans have been moving East readily, but find only limited demand here, cheapness being the only thing to commend them to the trade. Large shipments of Manchurian beans are beginning to arrive, competing mainly with white and cranberry beans, selling about 1 to 1½¢ per lb. under the prices for those beans.

[Uncleaned, on wharf, San Francisco.]

 Melilotus Indica 5@ 8¢
 Melilotus AlbaNominal
 Bur clover, recleaned12½¢

HAY.

Local arrivals have dropped off a little, as might be expected around the holidays, but more is coming in by rail, and the car situation looks a little more encouraging, though far from satisfactory. Sales have been light, but all offerings are well cleaned up at firm prices, with an advance on stock hay. Offerings here are mainly of the better grades, and cheap hay is rather at a premium, both here and in many parts of the country, much of it having already been cleaned up. Alfalfa is in very strong demand, and some large sales are reported in the country. In the bay towns alfalfa retails around \$20 per ton. Weather conditions so far have been favorable for the new crop, but it is too early to draw conclusions.

[Prices per ton, carload lots, San Francisco.]

 Prices Quoted as Paid to Producers.

for poor stock; and tomatoes and rhubarb hard to get; though there is some stuff coming from Florida, etc. Beans and peas are out of the market. The potato situation is a little unsettled, showing more strength since the first of the year. Oregon stock has no market East at present, and is coming this way in large quantities, with heavy offerings in the north. Salinas goods, however, are well cleaned up; Delta stock is in lighter supply than usual at this season; and a sudden demand from Texas this week has brought a much better tone to the market. Onions are scarce, with no outside stock yet in sight, and prices are advancing.

Lettuce, crate\$1.00@1.25
 Celery, Delta, crate 4.00

BUTTER.

At least two cars have gone East within the past week, and more is expected to follow soon, while local arrivals have been very moderate. So far, however, supplies are sufficient to take care of local needs, and an advance at the close of last week was not maintained.

Several cars have been shipped East, but a little jump in prices Saturday stopped buying for shipment, especially as the extreme cold has made shipping rather hazardous. Offerings were small for a few days, but are again on the increase, causing easier prices for the moment; though this will no doubt bring a renewed shipping demand.

Both flats and Y. A.'s have registered another advance, as a result of a steady demand for shipment, which is leaving rather scant supplies for local requirements.

DECIDUOUS FRUITS.

Los Angeles, Jan. 2, 1917.
 The cold weather has made it impossible to ship the northern apples East, and they are causing this way in large quantities, causing an easier feeling in the local market, which has to some extent affected Bellflowers and Newtowns. The former are about cleaned up, and are lower, with little strictly good stock offered. Newtowns are moving slowly, but there are some large inquiries from England.

Apples:
 Bellflower, box75@ .85
 Newtown 1.00@1.15
 Pears, Winter Nellis 2.25@2.75

DRIED FRUITS.

The market everywhere continues

dormant, with jobbers and small dealers taking stock. Local packers believe that nearly everything is out of growers' hands now; at least, a much larger proportion than usual at this season; and with such concentration of stock no weakening of prices is anticipated. Packers' stocks are moderate, and a rising market during the spring is looked for with full confidence; while the belief is that if the war should end suddenly the market would be fairly skyrocketed. This consideration will also affect the coming crop, which is expected to bring very good prices, with little regard to quantity.

[Net to growers, bulk basis, f. o. b. shipping point.]

LOS ANGELES.

BUTTER.

Receipts of week ending Jan. 2, 1917227,900.
 Receipts of week ending Jan. 2, 1916244,680.

Following Christmas the market assumed more life. Receipts since our last review have been only fair, and cold storage stocks continue lighter than a year ago. The tourist season opened during the week, which gave us an increased consumptive demand, and there was no corresponding increase in the receipts to meet it. This made buyers on call more willing to take hold and caused a firmer market. In San Francisco the market advanced ½¢ during the week, and Chicago the same, while New York ruled firm at last week's prices. The New Year opened here with very fair receipts and little interest in the market. There was no trading on call, and the market was made the same as Saturday.

Receipts (railroads) for week ending Jan. 2, 1916—801 cases.

With the Christmas demand satisfied the market the past week showed a little more weakness. But with light stocks in cold storage and the receipts running about the same as a week ago, decline in Los Angeles being only 1¢ up to Saturday, while in San Francisco the market advanced. In Chicago the market showed no change, though was rather firm under severe weather, and the same may be said of New York. Tuesday the new year opened with a stronger tone to the market. Receipts were light for two days and buyers bid the market 1¢, and there several lots sold at this advance.

We quote fresh ranch case count, 38¢.
 Pullets, 34¢. Candle 2¢, and selected 3¢, over quotations.

 Squabs, live, per doz\$1.50@3.00

Special Livestock Market Report.

San Francisco, Jan. 2, 1917.

The feeling continues strong with cattle, but quotations remain unchanged. Offerings are light, but some good shipments are arriving from the northern part of California and Oregon that were bought outright by packers.

HOGS are advanced on all classes except lightweights, packers' yards being full of the latter, which are moved with difficulty. Receipts are falling off, the reduction last week amounting to fully 20¢ per cent, but the quality is good.

SHEEP continue on the same basis as before. Supplies are coming from feed lots with no outside offerings.

WOOL—The holidays and the continuance of peace talk has stopped all local dealing in wool. Dealers report a total lack of inquiry for wool from the East, and are doing no buying as a result. The Boston market is strong, but nothing is moving.

[Prices paid for stock, live weight, at cars, without feed or water, at Stock Yards, South S. F. Hog prices subject to seller standing one-half of all hogs condemned by government inspectors.]

North Portland, Ore., Jan. 1, 1917.

CATTLE—The continued light receipts of cattle today met a very keen demand, and prices ruled a good 25 cents higher than last week, when a 50¢ advance on the best beef grades. One load of good steers brought \$8.50, with another bunch at \$8.35; fair to good kinds brought \$7.50@8.00. All supplies were sold and weighed early, there not being enough here to let each buyer get a load. The stuff also sold readily although no strictly good ones were included in the day's trade. Fair beef cows brought around \$6.50, \$6.75, with ordinary ones around \$6.00. Only a few bulls available, best bringing \$5.25 from feeders. Best heavy bolognas from \$4.25 to \$4.75, with light kinds \$3.50 to \$4.00.

HOGS—Hog prices continued their upward climb today again breaking all records for the winter packing season. There was but a moderate run of 2000 head here which was quickly bought up. Prices were 15 to 20 cents higher on all good kinds while pigs were advanced another 25¢. The quality of the run was the best of the year. One load of prime heavies brought 10.25 with another load at 10.20. Bulk of the good packing hogs sold from \$9.85 to 10.10. Pigs brought 8.50 to 8.75, stock hogs met a good demand with but a light supply. Best 80 to 125 lb. pigs are selling from 7.00 to 7.25.

SHEEP: Sheep prices continued upward when prices on all kinds were quoted 25 cents higher. Good lambs are selling 10.50 to 10.75; good yearlings 9.00 to 9.25 and good mutton ewes 8.00 to 8.25. Supplies continue light.

Los Angeles, Jan. 2, 1917.

CATTLE: As usual holiday week it was quiet the past week in this market. Receipts were moderate and mainly from California and Arizona. Quality of the steers arriving was very good for this time of year and mainly grass fed, the best fed steers having been pretty well disposed of. While prices are not notably higher they are very firm in sympathy with strong markets east.

Quotations, f. o. b. Los Angeles:

Beef steers, price 1000 to 1100 lbs.\$7.00@7.75

Stockers and feeders 5.50@6.00
 Prime cows and heifers 6.25@6.50
 Good cows and heifers 6.00@6.25

HOGS: A firm market was had the past week, the cold weather encouraging the consumption of fresh pork, and the Eastern market continues high. Hence packers had to bid up pretty strong to get what they wanted. California and Arizona furnished most of the supply and as of late were mostly light weights. But few Idaho hogs coming in, most of them being drawn East by the high prices there.

Per cwt. f. o. b. Los Angeles:
 Heavy, averaging 250@300 lbs. 9.25@9.50
 Mixed, 200@250 9.25@9.50
 Light, 175@200 9.25@9.50

Rough docked 20 pounds, piggy sows 40 pounds and stags 80 pounds.

SHEEP: Falling weather checked the receipts the past week which were light and market in consequence very firm and in some instances the best of them brought a little more money. Killers were all in the market and wanted supplies and the offerings were soon disposed of; wethers and lambs both meeting with an active demand.

Per head f. o. b. Los Angeles:
 Prime wethers\$7.00@7.25
 Prime ewes 6.50@6.75
 Yearlings 6.50@7.00
 Lambs 6.50@7.00

CALVES: Offerings light the past week and what few coming in were soon disposed of. Selling at \$8.50@9.50 per cwt.

Dressed	3.75@4.85
BEANS.	
The past week was another quiet one in this market. As usual during the holiday week there was little demand. What few moving brought steady prices. With the coming of the new year a better movement is looked for. We quote from growers:	
Limas	\$7.75@ 8.00
Large white	9.25@ 9.50
Small white	9.50@10.00
Pinks	7.25@ 7.50
Blackeyes	5.25@ 5.75
Tepary	5.75@ 6.25

Special Citrus Market Report.

Los Angeles, January 2, 1917.

Shipments of citrus fruit from Southern California from November 1 to December 28: Oranges, 2390 cars and lemons 728 cars. The same time last year oranges 1,028 cars and lemons 798 cars.

Shipments from Central California from November 1 to December 27: Oranges 3590 cars and lemons 104 cars. Same time last year, oranges 3,666 cars and lemons 104 cars.

Shipments from Northern California from November 1 to December 27: Oranges 816 cars and no lemons. Same time last year oranges 553 cars and lemons none.

The Christmas trade having been satisfied, the Eastern market last week showed weakness, and the less desirable sizes were a little lower. The crop continues to go forward quite freely, but it being the going out of the old year and the coming in of the new, buyers were inclined to hold back and go slow. Still fair prices were obtained for the best known brands. Lemons were also weak to lower. A good many poor lemons going forward. Locally the market was the most quiet for the past six months. Local packers were holding out of the market, wait-

HAY.

It was much a weather market the past week. Many of the arrivals came in in open cars and were more or less damaged by the rains. Such offerings were hard to move and were sold for less than quotations. All good dry hay was in fair demand and steady. Receipts only fair yet equal to the demand.

We quote f. o. b. Los Angeles:

Barley hay, ton	\$16.00@18.00
Oat hay, ton	18.00@20.00
Alfalfa, northern, ton	15.00@16.00
Alfalfa, local, ton	17.00@18.00
Straw, ton	7.50@ 8.00

ing to see how the Eastern markets would size up on the opening of the new year.

What few oranges bought by local packers were at 1c per pound, but they only paid this for nice fruit. Poor had to be sold for less. Grapefruit is 1/4c lower and less active, packers only bidding 1 1/4c to 2c per pound in the grove. Lemons are also dull at 1c per pound in the grove for the best; poor has to be sold for what they will bring.

EASTERN CITRUS AUCTIONS.

New York, Dec. 29.—Eighteen cars California navel, one Arizona navel, two cars California lemons sold. Navel unchanged; lemons lower on account of poor quality. Arizona unchanged. Weather fair.

California navel averaged \$1.50 to \$2.80. Arizona navel averaged \$2.00 to \$2.35. Lemons averaged \$1.10 to \$2.20.

Boston, Dec. 29.—Six cars sold. Market doing better. Navel averaged \$1.90 to \$2.75. Lemons averaged \$2.50.

Philadelphia, Dec. 29.—Two cars sold. Market higher on navel. California averaged \$1.90 to \$2.35.

was applauded when the guests drank a toast to 1917 and the 30,000 subscribers the Rural Press is to have before the end of the year. Those present were: Prof. E. J. Wickson, W. H. Schrader, F. A. Tutt, H. E. Pastor, C. Powell, R. E. Hodges, J. C. Loomis, D. L. Schrader, W. D. Guthrie, W. C. Leland, R. H. Pearson, C. H. Barnum, C. W. Smith, R. R. Neimeyer, O. L. Linn, J. H. Bridges, Thos. Gregory and Frank Honeywell.

We trust that next New Year's day we may have every one of those present at another meeting held for the same purpose.

MOVING BIG PALM TREES.

[Written for Pacific Rural Press by W. H. Shafer, C. E., Selma.]

Answering the question as to how to move big palms in issue of Sept. 9, have moved numbers as follows: The best time to move is just before spring growth begins, in March here. Make a crib of timbers on the side of palm that you expect it to fall, high enough to raise the butt above the ground, far enough to allow a dray to back under after the tree is down. Dig the tree out, falling it with ropes if necessary on the crib. Do not try to save the roots, but do not injure the base of the trunk from where the roots start. You will have numerous roots from two to four feet long. Cut these all off just before replanting as they will all die anyway. Back your dray under, raise the tree with two jack-screws enough to remove the timber crib and lower it to the dray. Put a light truck under the top to keep this from dragging on the ground and wearing out. Haul the tree to its new location.

Rebuild crib far enough from the proposed new site so that the tree will nearly balance on the crib. Get the dray away and dig the hole a little larger than the base of the trunk. In this sandy soil I plant three feet deeper than the tree formerly stood. Raise the tree upright by means of a double block and tackle over an A-shaped frame to give it a lift at first tightening of the ropes, dropping the base in the hole prepared. Fill the earth around the base and give plenty of water. I have moved trees thirty feet tall and weighing many tons and never lost one. The roots of a palm are like grass roots. Under the base of a palm are hundreds of pointed embryo roots that will quickly replace the ones cut off. The whole secret lies in not unnecessarily bruising the trunk of the palm, and giving

plenty of water every day in its new location until growth is re-established, which will be shown by the palm producing new leaves of a healthy green color.

I have moved palms weighing nearly four tons one-half mile for a cost of twelve dollars each.

Belting

That Must Make Good

When you buy a rubber belt you should know what service it will give you or have the belt service guaranteed by a responsible firm who will make good in case the belt falls down. Every belt-buyer should know how to judge a rubber belt, and we would like to send you a free sample of **Test Special** together with our folder that will tell you just how to judge a rubber belt so that you may know just what service you will get from any belt you buy.

Fill out the coupon and mail it to us and we will recommend a belt that we will unqualifiedly guarantee to do your work satisfactorily. We have had seventy years' manufacturing and selling experience.

Pull Big Stumps by hand

Showing easy lever operation

Clear your stump land cheaply—no digging, no expense for teams and powder. One man with a K can rip out any stump that can be pulled with the best inch steel cable.

Works by leverage—same principle as a jack, 100 pounds pull on the lever gives a 48-ton pull on the stump. Made of Krupp steel—guaranteed against breakage. Endorsed by U. S. Government experts.

K HAND POWER Stump Puller

A get-together meeting of the Rural Press force was held at this office all of New Year's day. The subscription force, with two exceptions, and the advertising, editorial and business departments were each fully represented. Never before had all of the men met each other, while in many instances fellows who knew each other well met from different fields, having not seen each other for several months.

It was a fine meeting and we thoroughly enjoyed the way they met serious and knotty problems. We believe that every man, no matter which department he represented, learned something to his advantage and to the future betterment of the paper. Not only did the editorial force come into actual contact with the feeling as to the Rural Press as it exists among our subscribers, but the solicitors got a close touch with the ideals of the editors and what the paper stands for and is attempting to do for western agriculture. It was give and take all day long, but no hard feelings were engendered through the discussions. The work of the day was followed by a dinner in the evening, after which short speeches were given, headed by Prof. Wickson. The sentiment: "True friends, like ivy and the wall it props, both stand together or together fall,"

Publisher's Department.

Don't wait now in placing your orders for nursery stock. You will need it soon and the early orders get the best attention—besides some lines will soon be sold out. Remember that in buying from an established nursery you secure the protection of a good name for square dealing.

Advertised goods are usually the best. Think for a moment and the force of the above will prove itself. The man or firm who advertises, does so to get your trade. To make a profit he must secure return orders, and in order to secure your steady patronage he must please you on the first purchase.

Howard C. Rowley, publisher of the California Fruit News, is to be congratulated upon issuing a very handsome and comprehensive number of his journal last week. This annual review number is a regular affair with Mr. Rowley, and it always contains a great deal of matter of great value to the fruit interests of California. The crop and market statistics given are the best of any that we know of. Price of this number is 25 cents.

Why Use Horses?

When This Great Little 2800-lb. BEAN TrackPULL Tractor makes it

PAY TO GET RID OF THEM

BEAN TrackPULL ^{Six} Horse Tractor

Horses are great pets! BUT, you are running your orchards or your vineyard to MAKE MONEY and horses are MONEY EATERS—a fact that the wonderful patented BEAN TrackPULL 6-horse Tractor proves absolutely. Sooner or later every orchardist and vineyardist is going to find out that paying out \$225.00 a year just to feed one team, and \$675 a year to feed three teams, whether they work or not IS TOO MUCH! When a simple little tractor that "eats" only when it works and that does the work of three teams costs to buy only a little more than it costs just to feed four teams for one year isn't it time to think of getting that tractor?

No Other Works Like This In Vineyards and Orchards

This Tractor works between five foot rows in vineyards and under tree boughs only four feet off the ground in an orchard; and it will plow within an inch of the vines without breaking off young shoots, and closer to your trees than any horse can go.

The BEAN TrackPULL Tractor pulls anything that six horses can pull. Especially adapted for cultivating. Enjoys working in the hot weather when your team sweats, loafs and pokes.

The BEAN TrackPULL is by far the simplest of all tractors. Its construction (covered by basic patents) permits greater traction with lighter weight, and light weight means low operating cost and ease in handling. A boy can operate it. The BEAN doesn't pack even the loosest soil. You should see it work in soft ground!

Note that the BEAN pulls itself over the ground instead of pushing itself. It's the only light tractor that "gee's" and "haws" like a team. When you hit soft spots you simply swing the whole track to right or left and pull out.

Other big features are: Turns clear around inside a ten-foot circle. Gets into

corners like a team. Pulls as strong on turns as on straightaway. Motor is simple four-cylinder automobile type—but for heavy duty. Power goes through only four big gears and simple friction clutch. Hyatt Roller and New Departure Ball Bearings throughout fully dust protected. You can remove grousers and wheel flanges and run on boulevards. Works night and day when necessary. Has pulley for stationary work.

SEND RESERVATION COUPON.

Sending in coupon below doesn't obligate you to buy. It simply reserves one of these tractors for you. If you don't buy in a reasonable time after coupon is received by us the tractor is sold to some one else. That's all there is to it. We'll send you big descriptive folder, and tell you name of nearest dealer who can demonstrate tractor for you.

Don't wait. Thousands want this patented tractor and no other, and soon we will have sold our entire year's output. We are sold a long way ahead now.

The BEAN TrackPULL Tractor will save you big money. If you don't reserve one now you may have to wait another year.

In the Orchard.

In the Vineyard.

Turning in 10-Foot Circle.

BEAN SPRAY PUMP CO.

211 W. Julian Street,
San Jose, Cal.

This coupon does not obligate me to buy a Tractor but is simply a request to reserve one for me for a reasonable time. Please also send prices, terms and the big folder with the complete story of the BEAN TrackPULL. Also name of nearest dealer who can demonstrate.

Raise High Priced Wheat on Fertile Canadian Soil

Canada extends to you a hearty invitation to settle on her FREE Homestead lands of 160 acres each or secure some of the low priced lands in Manitoba, Saskatchewan and Alberta. This year wheat is higher but Canadian land just as cheap, so the opportunity is more attractive than ever. Canada wants you to help feed the world by tilling some of her fertile soil—land similar to that which during many years has averaged 20 to 45 bushels of wheat to the acre. Think of the money you can make with wheat around \$2 a bushel and land so easy to get. Wonderful yields also of Oats, Barley and Flax. Mixed farming in Western Canada is as profitable an industry as grain growing.

The Government this year is asking farmers to put increased acreage into grain. Military service is not compulsory in Canada but there is a great demand for farm labor to replace the many young men who have volunteered for service. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

Apricot Markets Good and Culture Safe.

[Written for Pacific Rural Press.]

APRICOTS enjoy marketing advantages superior to any other fruit except pears and apples, in that most of the commercial varieties may be shipped, dried, or canned, depending on which seems likely to pay best in any given season; and if dried, the pits bring around \$50 per ton. It is true, also, that California has no important competitor in apricot growing for the market. Add to this the fact that, as M. Sharpe of Solano county observes, "Apricots will do on almost any soil, provided the stock is adapted to the soil; and they do well on any stock except the almond"; then you have cultural advantages possessed by few fruits. Add to this their longevity and great freedom from sunburn and baffling diseases—then why should not apricots be grown with confidence in California?"

Growers of Dried Apricots have been at the mercy of the packers; but even so, they have not suffered depressingly low prices as many of the other fruits have. Lest they might at some time in the future, they are taking the marketing into their own hands; and it is confidently expected that the next crop will be handled by the growers for the growers in a way by which the market can be expanded as there is need. We have the following from George E. Merrill, Secretary of the Prune and Apricot Growers' Organization Committee, under date of Dec. 28:

"We are convinced that the apricot men are signing up in the Association just as freely as are the prune men; and we are confident that by March 1, there will be at least 75 per cent of each fruit in the Association. In many sections of the State we already have 90 per cent of both prunes and apricots signed up; and what is possible in these sections is also possible in every other section. It is my personal opinion that we have today at least 40 per cent of the apricots of the State actually signed up. So far as we can judge from interviews with the growers, there is, generally speaking, a feeling of optimism regarding the future of the apricot industry. The plantings this year will make use of all the apricot nursery stock available, and progressive growers look forward to a good period of prosperity, especially after the association goes into effect. The writer was much impressed on a recent trip South, with the extensive apricot planting in Riverside, Los Angeles, and Ventura counties. He was also pleased to note the vivid interest of the growers regarding the best methods of pruning the trees and harvesting the crop. In certain sections the orchards present indications of having received intelligent

care from the start. In other sections the idea came very strongly to the writer that radical changes in pruning methods might result in better fruit."

C. O. Silliman, a pioneer apricot grower of Pajaro Valley, who with associates planted 180 acres many years ago, notes the large recent plantings, and says that under present marketing conditions, he could not advise planting apricots,

from the growers, the more profit for them. At the same time, they have depressed prices in the East for the year, by their competition to sell so early in the season. If they cannot buy from growers to good advantage, they are supersensitive about the quality of fruit delivered under their contracts. But the greatest evil of the system, as Mr. Silliman impressed us, is that it prevents individual packers from pushing new

means of disposing of fruits as the acreage and crops increase. An instance is the delicious whole dried apricots of which Mr. Silliman put out fifteen tons one year. He asked various packers to put a few boxes of these into each carload of ordinary fruit and get opinions of their Eastern clients. It was too much trouble in this case, as in others which he urged.

But the proposed organization of apricot growers would be most certain to seize every opportunity to develop new avenues of disposal and to increase by advertising the consumption in America. In this expectation, Mr. Silliman thinks apricot planting entirely safe.

For Fresh Shipping purposes, the Royal is the premier and undisputed sovereign of the Eastern auctions, except for a few of earlier varieties. One of the best authorities on California shipping fruits says he would not personally advise planting more apricots, as he thinks the present normal supply is enough to equal the demand.

"The demand for apricots is different from that for any other fruit in that the apricot enjoys a short season, and we doubt if it would be advisable to lengthen it by shipping later varieties.

"By the introduction of the apricot to smaller markets throughout the country, we have created a demand that has enabled us to satisfactorily dispose of our apricots for several years. There has been practically no competition from apricots raised in any other State. The Winters and Vacaville districts up to date have produced the best shipping apricots in California. A Santa Clara grower has shipped Blenheims to Honolulu successfully the past season.

In Imperial Valley, 110 acres of apricots were reported in bearing in 1915, and 335 acres of young trees. These are mostly Newcastle, Blenheims, and Royals. E. H. Erickson is the pioneer, with trees 10 years old. He has not found the Royal profitable, though H. S. Reed, probably the largest apricot grower in the Valley, has

(Continued on page 38.)

Apricots Do Well on Many Stocks and Soils; May Be Canned, Dried, or Shipped; the Pits Are Valuable; the Markets Bare, Demand Good; and the Growers' Organization Promises Well.

cots, because they could not be sold at a profit. During his many years in the business, he has made friends with many of the packers, and has no unfriendliness toward them, but only toward the system under which they must operate. He says it is a fact that packers ordinarily have 60 per cent of the dried crop sold before they buy the fruit. Then the cheaper they can get it

CALIFORNIA WINS EITHER WAY.

W E ARE at a loss to know what has become of the California peace drive which we mentioned with sincere delight in our issue of December 2. At that time California peace-makers stated terms of peace and prepared to send them Eastward with half a million signatures. It could not have traveled very far before the Kaiser submarined our proposition with his own peace projectile, and gave President Wilson a chance to unleash his dove as the original and only American proposition. Under the circumstances we are at a loss to know whether the California peace pigeon ever got beyond Omaha or not. The general fact seems to be that there are at least three peace birds somewhere in the sky, and all the belligerent hunters are out gunning for them. The enemy-nations seem to be fighting now more briskly than ever—which is perhaps due to the fact that they all know now that they are fighting for peace!

But though California's peace bird may surely be trying to fly with a broken wing, and though the whole peace output seems to be worse war, there is some consolation in the claims, which are now being made, that whether in peace or war, California will go ahead in her regular line of business of benefiting the world just the same. John Perrin, chairman of the Federal Reserve Board of the San Francisco district, in his review for December, points out the fundamental reasons why peace cannot affect the Pacific Coast States adversely. He says:

"The industries of the Pacific Coast have not been developed to such an extent as in the East. In no sense have we had the feverish activity in all lines which have characterized the Atlantic States. On the other hand the Pacific Coast has sold its raw materials at extremely high prices, and has been enriched by the effect of the war without entering upon an era of over-speculation and expansion. If the war were to cease, industries such as lumbering would be greatly stimulated, and other activities which have been repressed by the lack of transportation facilities would receive a new forward impetus. It seems probable that the transition from a war condition to one of peace will be marked by a minimum of disturbance of the conditions of prosperity which now prevail quite generally throughout the Pacific Coast.

AMERICANIZATION OF CALIFORNIA.

O NE result of the war which will be of permanent and wide value in the development of many California industries will be the more thorough alliance of our production with consumption in the United States. Readers will remember, for instance, the drive which speculators made on our cured fruits, on the ground that embargoes and high cost of ocean freights would cut us loose from our great European consumers, and render our products nearly worthless. It hardly worked that way for a minute. The United States rose immediately to full values for home use, and showed such capacity that we have had, right in the midst of the war, the easy capitalization of the greatest producing combination in the line of cured fruits ever realized on

this coast. How it will behave toward fruit-growers needs to be demonstrated, but as manifesting the confident attitude toward the outlook for the marketable product itself, the success of this capitalistic venture leaves nothing to be said. On the growers' side, the continued success of the orange, raisin, walnut, almond producers, etc., and the enthusiastic support of the peach, prune, and apricot organizations, are all demonstrations of the strength and confidence in our fruit industries. We believe these demonstrations rest in large part upon the newer view and confidence in the opportunity for these unique products in American markets. It is clear now that previous to the war we were viewing California too much in the light of an appanage of Europe, and figuring that our great surpluses must largely go that way. We can now see that this was an error. It was easy to deliver vast consignments of fruit products and allow European distributors to make the chief money out of them. It is perhaps more difficult and expensive to develop American markets to greater capacity, but it has already been shown to be quite practicable and more profitable, and all our large growers' organizations are working very intelligently toward that end.

WHY IS THIS DESIRABLE?

W E CAN see at least two very promising conditions proceeding from our experience during the last two years:

The popularization of our unique products in American States and increasing dependence of American consumers upon California products will increase national concern in and appreciation of those products and will generate much wider interest in protecting these products from competition with cheap labor products in foreign countries. It will be more clearly seen that such protection will not advance cost of such products to consumers, but will shear closer to the skin a lot of traders who have been spending a good part of their incomes to remove protection from California products, not that they may sell them for less to consumers, but that they may increase the profits on importation after they get the open ports they are willing to pay for. Every carload of good stuff which we can sell at the East, the more difficult and less profitable it will be to play the importers' game.

The unfolding of this new view of American patronage of California products widens our outlook for profitable production. We shall still sell in Europe, perhaps more largely than ever, but in less ratio to the total product. This is the view which justifies the wide disposition toward greater fruit planting which prevails this year. It also warrants an interest in planting a greater variety of fruits which have demonstrated their acceptability to canners and their value in orchard curing. We shall probably need not only more fruit, but more kinds of fruit.

CALIFORNIA FOR TARIFF BOARD.

A S WE have incidentally mentioned protection as more likely to be secured as we secure wider American knowledge and interest in our products, we wish to make a more direct reference to tariff matters. It is now pretty well understood that the tariff will retire from the political need. At the last election both parties committed themselves to the adjustment of tariff questions by an expert tariff board—so that whether staying with the Democrats, as we did; or going with the Republicans, as we might easily have done, the tariff quarrels would be settled by the same agency—a national non-partisan tariff commission. And now it is announced that President Wilson may appoint Willis H. Booth of Los Angeles as a Republican member of that commission. Mr. Booth will be very satisfactory as a California representative on the commission, because he is a thoroughly qualified expert on all matters entering into conditions of production in this State. It is also pointed out that Mr. Booth is one of the best qualified foreign trade experts in the United States. He has traveled in practically every country on the globe and has made first hand studies of the conditions that must be met by American producers. In this way Mr.

Booth has prepared himself for service such as the provision of a tariff commission contemplates. It is also fitting that Mr. Booth's knowledge and experience in California production should be recognized since California has more industries that need a fair measure of protection than probably any other States in the Union. Besides, in California protection is perhaps more directly allied to the interests of the multitude of small producers and freer from the danger of ministering to monopolies and trusts than in any other State. California desires that the tariff be adjusted to secure fairness in production and sale and cancellation of advantages to those who exploit cheap, foreign-labor production in American markets. We hope that Mr. Booth will be appointed and that he can give his time to this patriotic service.

WHY CALIFORNIA IS GOOD FOR PEOPLE

I S IT not strange that Californians who have been busy for more than six decades demonstrating the superiority of California over wintry countries for the growth of fruits, vegetables, grains and domestic animals, should only at this late day be doing something in systematic demonstration of what California is doing and can do for the human race? Of course, California has not just awakened to consciousness of the fact. It has been insisted upon, with more or less poetry and oratory, ever since the mining pioneers passed their first winter in the foothills; it has been embalmed in our real estate literature from the time the first authenticated sale of climate was made; in fact, it has been so common that some people have become ashamed of it, and have blushed when an orator has said that climate was the most distinctive and beneficent resource of the State—as though he were proclaiming something fanciful. Of course, then, Californians have always had consciousness of the forcing, developing power of the California climates, but they have given the world no definite measures of it; the efficiency percentage of the California climate in the making of people has not been worked out in a scientific way. In the case of fruits it was done years ago—in fact, in the '50's, when drawings were first made of outlines of Eastern-grown fruits far within the outlines of the same fruits grown in this State. It was done with grains when a Californian horseman was pictured tying the heads of grain across his horse's withers, while grain of Eastern stature passed under his belly. It was done with sheep when wool staples were accurately compared in length and when the California yearling came along with the teeth of an Eastern two-year-old. And there were many other definite measurements of the wonders of the California climate in the development of superior forms, precocity, etc., with both plants and lower animals, which need not now be cited; but nothing definite and systematic with people. There was plenty of impressionable evidence—such as the common experience of average Eastern-grown parents walking under the extended arms of their California-bred offspring, but such evidence is not of scientific record.

Fortunately such systematic record has now arrived. Dr. E. S. Sundstroem of the University of California and a race biologist of note, has tabulated the rate of growth in terms of weight and stature of about 1000 Oakland children of Scandinavian parentage and compared this with the growth of Scandinavian children in the old country, and also with the growth of the average Oakland children. The figures selected by Dr. Sundstroem for comparison are from the families of the well-to-do in Sweden, where food and surroundings are in no way inferior to those supplied by the American home. These are some of Dr. Sundstroem's conclusions:

"The only difference, then, is the difference in climate manifested. And the effect of climate upon growth is manifested by the fact that in regions suffering from severe winters the children stop growing when the cold weather sets in, while in California they grow almost continuously during the whole year, and therefore have a chance to get ahead of their less fortunately located foreign brothers and sisters."

"Thus, it is actually probable that of twins separated in childhood, the one raised in California would be taller and weigh more and reach maturity one year sooner than the other child reared in Sweden. The greatest average difference in stat-

ure is something over two inches—this much to the credit of the California child."

It is also interesting to note in this connection that the California-grown child has not only the chance to be larger and to mature sooner, but he may also expect to live longer. The last report of the California State Board of Health says this:

"Every year Californians live to be a little older. In 1914 the average age of death was 49.6 years, and in 1915 it was 51.6 years. The average age of death has advanced more than three years since 1911. The increase was greatest from 1914 to 1915, and applies to both men and women all of the principal causes of death in every geographical division of the State."

ROSES AND THORNS.

WE ARE much ashamed of the ignorance, stupidity or malice which has induced some of our San Francisco contemporaries to seek a vain glory for the bay region by unwarranted comments on the fact that roses were bought in this part of the State for the adornment of the rose carnival on New Year's day in Pasadena. We hope the use which they have made of the fact can be attributed to ignorance and nothing worse. They have been rejoicing that San Francisco could ship thousands of dozens of cut roses at a time when the Pasadena supply failed—which would have been well enough if they had frankly stated that the San Francisco roses were grown under glass. It would have been perfectly legitimate to have gloried at the fact that the San Francisco region has much greater resources and capacity in the way of house-grown roses than the Los Angeles region has, and has developed a fine long-distance ship-

ment business in cut flowers. But to convey the popular impression that we were cutting these tens of thousands of roses in the open air, and therefore have a better climate for holiday, blue-sky roses than the Los Angeles region has, is immoral. This year the latter region struck an unusual run of low temperatures, dark skies, and fogs—these discouragements to blooming of open-air holiday roses, starting in earlier in the south than farther north and reaching down to quite low December temperatures. Because of this the Southern California rose gardens did not come through as usual, and Pasadena had to buy hothouse roses to maintain her New Year's pageant. As the event is far more social than horticultural, the managers were justified in getting roses wherever they could to delight their guests, and they found them under glass in the San Francisco district. This fact has at least two significances. It shows that San Francisco has a large and growing business in cut-flowers from under glass, and investment therein is justified. It also shows that the Los Angeles district depends so much upon open-air cut-flowers that the business in higher-class glass stock can be developed only at considerable risk, and it is therefore neglected. San Francisco ought to be glad enough of its commercial development to honestly exalt it, and not try to play false pranks with it. Besides, it is not a good commercial policy to try to ruin the joyful business of those who buy stock from you. Once again, a great metropolitan journal ought to be above sectionalism and provincialism. It ought to admire a resourceful, progressive spirit manifested anywhere in California.

planted, they should be shaped up well now—sometimes cutting well back into the old wood to get good form and strength in main branches. An almond tree should surely be well pruned for three years and some claim it should always be pruned—but most growers have not brought themselves to that conviction yet. No doubt many rangy, wind-broken trees and trees full of dead wood or weak brush are the result of the non-pruning doctrine which is too often applied to the almond.

Irrigating Sweet Potatoes.

To the Editor: Do sweet potatoes need much irrigation? My sweet potatoes most all went to vines and long roots. They were in sandy soil. I thought perhaps I had watered them too much. —A. P., Red Bluff.

You probably did. Sweet potatoes may need irrigation and they may not: it depends upon how much natural water there is available in the soil in which they are growing. On moist river lands, they often not only do not need irrigation but do better if planted on ridges from which they can reach down and get the moisture they need. On the fine upland loams where most of the crop is grown they are often irrigated, but not so as to flood the surface but in furrows which place the water under the plant to be used as desirable. Try it again and do not irrigate so long as the plants make good growth of vines and have good fresh-looking leaves. If they show signs of stopping growth and of making too small leaves give them some water.

Onion Sets in California.

To the Editor: Which is the best time to get the best results from dry onion sets?—M. B., Novato.

In California valleys it is possible to get mature onions at nearly all times of the year by starting with the seed about five or six months ahead of the desired maturity and making the crop either with field-sown seed or small seedlings taken to the field from seed beds. As the onion does not object to light frosts the early onions in June come from seed sown in the preceding autumn and later onions from winter and spring sown seeds are transplants. Onion sets are particularly useful in places where winter temperatures are too low because you can start later with them and catch up with plants from earlier sown seed. Probably they can be used to best advantage in February and March, but they are not largely employed in this State. We grow sets chiefly for shipment to the Southern States for their early crop.

Grapes on Alkali Spots.

To the Editor: Last spring I set out 5 acres of Muscat vines. All started and some made a tremendous growth; others, in alkali spots, put out a few leaves, then died. I intend to reset this spring and want a Muscat budded on something that will withstand the alkali, such as Malaga or something else. What root will be best? Also, will it be worth while to dig out a pretty good hole and haul some sandy soil in to start them in alkali spots?—L. C. M., Selma.

It depends upon how strong the alkali is and whether there is hardpan which holds alkali water up for evaporation. Grapes will stand some alkali if the water can get through. We know of no grape root which will stand bad alkali. The Malaga has the reputation of standing more than the Muscat. If you can get a hole through an alkali pan and water can escape, it will help to start the vine to make and fill a hole as you describe. But if you cannot change conditions below, the improvement will only be apparent and temporary.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agricultural Weather Bureau at San Francisco, for the week ending at 5 p. m., January 9, 1917.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address

Killing Plants with Gasoline.

To the Editor: In the Pacific Rural Press of Nov. 4, 1916, I note you suggest the use of gasoline in killing out "lupus." Do you advise using gasoline in the same way for killing morning glory? If so, how deep would it have to be applied and would the ground have to be dry when application was made? If the gasoline used should strike tree roots, would it kill the tree? —M. S. D., Lafayette.

We suggested trial of gasoline for killing weeds with big tap roots because experiments have shown that tree sprouts or seedlings can be killed by pouring gasoline around the crowns so that it will follow such roots a certain distance. In such cases gasoline has killed the outer or growing layer and the plant has perished. Of course such suggestion does not apply to fibrous-rooted plants. To kill them all the ground would have to be saturated with gasoline, and that if effective would be too expensive. A more reasonable treatment for plants with such roots would be the use of carbon bisulphid which has been advertised from time to time in our columns by the manufacturers. They probably have testimony which would be interesting to anyone desiring to try this method and which would determine the condition of the ground which favors such treatment. We have seen no demonstration which would give us original knowledge of the subject. Presumably such treatment would attack all kinds of roots which intrude into the killing area.

What to Do with a Winter Pond.

To the Editor: There is on my ranch a depression which I have to plant to fruit trees. This is 1000 feet long and from 20 to 100 wide. Water stands there from December to April, and the water level is but 18 inches below surface about June 1st. The use of drain tile seems impracticable on account of the low grade. Do you think it can be effectively drained by blasting? The subsoil is hard granite, found at 4 to 6 feet deep. What would you plant on said land?—F. C., Newcastle.

You will have to take some time to study this proposition. It would probably not do any good to blast in the way soil-blasting is usually done because that would have no effect on underlying rock. If you know which way the water moves from the depression now, you can prospect that

place for a rim or crevice and widen and deepen that by excavating and rock-blasting so that water would not be held back. If you do not know that, watch next summer for a place where the weeds keep green late and put an open prospecting ditch into the depression that way, and see if there is any chance for effective blasting. We apprehend, however, that getting drainage would cost more than the land is worth. It is not now suited for any kind of fruit. You ought to be able to get a fine lot of summer and fall vegetables by planting as soon as the surface becomes workable.

The Souring of Figs.

To the Editor: I have a row of fig trees on one side of my ranch and the fruit sours quite a good deal every year. They are close to a main canal where the water runs all summer. Would too much water be the cause, or is the ground sour? Would an application of lime do any good? If so, when and how should it be done?—G. S. B., Chowchilla.

So far as we know, the causes of fig-souring have not been definitely demonstrated. Growing conditions may promote or repress it and one has practically full freedom for conjecture, until demonstrations are reached. It seems to us, however, more rational to seek the cause in the aerial environment of the tree rather than in the soil and water, and the behavior or internal functioning of particular varieties has perhaps more to do with it than any environment. These are the things that need to be demonstrated. We do not know whether lime would do any good or not. It may be worth trying—if only for the relief of your conscience. Whiten the ground thoroughly now at the rate of 500 lbs. to the acre so the rain will carry it into the soil and put on as much more before working the soil toward the close of the rainy season.

Pruning Young Almonds.

To the Editor: Do almond trees of two years' growth need pruning?—B., Red Bluff.

They surely do. If they were pruned right a year ago and are low-headed and sufficiently branched, they should now be cut back about half the growth they made last summer, to get shorter joints and stronger shoots this year. If they have not been pruned since they were

Grape Mealy Bug and its Control.

Crops of vineyards in the Southern San Joaquin Valley have been made unmarketable by the mealy bug. Learn to recognize and control this menace before it becomes widespread.

[Written for Pacific Rural Press from data presented by R. L. Nougaret of U. S. Dept. Agr. at Napa Fruit Growers' Convention.]

Have you noticed drops of honeydew on your grapes when about ripe? Have your Muscats or Thompsons unaccountably stuck to the trays? Have you found drying raisin grapes infected with green mold when you turned them? Have you found white silky eggsacs, waxy white cast skins, small cocoons and mealy looking bugs at the tips of fruit spurs, under the bark, or in the bunches of grapes? Have your table grapes been sticky and repulsive with these remnants of a new grape pest? Have you seen the short-lived adult female about one-fifth of an inch long with dull white waxlike threads around the body, four of which appear like a tail?

One vineyard of 2½ acres of Malagas in Fresno was so filthy with these troubles that for three years the crops were sent to the wineries. Last year the trouble was reduced by spraying so that practically the whole crop was sold for table grapes.

It is the mealy bug. It has been serious on grapes in California only very recently. It has been commonly found in Fresno and Kings counties, and to lesser extent in Tulare, Merced, San Joaquin, and Tehama counties. Since it has been found on pears in Sacramento, Contra Costa, and Nevada counties, it is likely on grapes there also.

In 1915, in co-operation with Horticultural Commissioners Fred P. Roullard of Fresno and Fred K. Howard of Kings county, the U. S. Dept. Agr. began experiments to find a means of controlling the pest. R. L. Nougaret, the phylloxera and pear thrips investigator, was put in charge. The writer of this article was present when the first mealy bugs in a Kings county vineyard were discovered by Mr. Howard in Sept., 1915. Control measures fairly satisfactory have since been worked out, but the investigation will continue.

How to Find Grape Mealy Bug.—The larvae, smaller than a pin point, live over winter under layers of bark, also in crevices and cracks of the arms and head of the vine.

In the first warm days of spring, about late March or early April, when sap flow begins, they get a move on. They can be seen with the naked eye on a hot sunny day following a period of warm weather, by the contrast of their light color against the dark wood. The best place to find them is at the tips of spurs. In pruning, the bark on one side of a spur is slightly bruised and loosened by the bar side of the pruning shears. Under this bark the active larvae settle in numbers. Later as they grow, "they wander away to scales of buds, and other scales at the base of young shoots, and even onto young leaves." They mature in June and lay eggs in June and July. About 125 light orange-colored eggs are deposited in each ovisac of white silky threads. The ovisacs as observed by Mr. Nougaret on badly infested vines are about 65 per cent in the bunches of grapes,

mostly of the first crop, 20 per cent in folds of dry leaves fallen to the ground, under clods of earth, and in soil crevices, 15 per cent on the vine itself, of which four-fifths are on the head and arms, and one-fifth under strips of bark on the trunk. The ovisacs are generally hidden. This generation matures in September. While growing and mature they attack the grapes among which most of them have hatched. They suck large quantities of sap from the grapes, etc., and excrete sweet sticky colorless honeydew. This is what sticks raisins to trays and furnishes food for green mold. The larvae cast their skins in growing. These cast skins, egg sacs, and honeydew make grapes unmarketable if abundant. The larvae maturing in fall, lay eggs in September and October, which hatch into the overwintering larvae.

Control.—"Spraying is the only practical means of control on a large scale," says Mr. Nougaret. "The best time to apply the spray is when the young larvae forsake their winter quarters and settle in more accessible places. This may be all at once or it may occur intermittently for one or more weeks. Our experiments demonstrated that the most propitious time to spray, using the formula below, is when the young shoots of the vines are four to six inches long for Malagas and Emperors, and somewhat shorter for Muscats." The "blossom forms" of vinifera varieties are not injured by the spray. These "blossom forms" are the buds up to the time the individual blossoms separate with each on its own pedicel just before blooming. Up to this stage, they have a resistant secretion and a hairy mat which protects the buds from a spray which burns the young leaves.

Deciduous Frost Fighting.

To the Editor: Are smudge pots sufficient to keep frost away from almond trees in Calaveras county? Where can I buy the pots, what do they burn, how many are needed per acre?—D. M. N., Wallace.

They are efficient if kept filled with oil and lighted at the proper time; you can buy the kind used for deciduous trees from a firm which has been advertising in Pacific Rural Press for some weeks; they burn crude oil. We reprint part of Andrew Ryder's experience in Placer county. He prefers 75 two-gallon pots per acre, set in the centers between trees. The larger pots burn 12 hours without refilling and furnish more heat. One-gallon pots burn about eight hours. If two frosty nights come in succession, the men are tired enough without refilling before the second night. Labor of refilling large pots is reduced, painting and storage costs are less than with the usual 100 one-gallon pots per acre.

Oil is bought by the carload of 10,000 gallons, very cheap, and stored in a 2500-gallon reservoir for

The spray recommended is made by mixing thoroughly 4½ gallons of 34° to 38° B. distillate oil with 1½ gallons cresol soap by pouring the former slowly into the latter and adding three or four gallons of water, stirring all the while. This mixture is poured slowly into the spray tank containing about 190 gallons of water keeping the agitator busy.* If hard water must be used, add one or two pounds of good soap powder containing a high percentage of soap.

Use at least 175 pounds pressure and a nozzle with a small orifice and narrow stream. Hold the nozzle close as possible to all pests of the vine to cover every inch and penetrate crevice, crack, and fold of the bark. Touch the tip of every spur with the nozzle, to shoot the spray direct into its cracks and under the bark. Direct spraying of the shoots is unnecessary, since the foggy cloud will rebound and coat the shoots. With high-headed vines, the lower part of the trunk does not harbor so many of the bugs.

Results.—The best definite results, aside from the small vineyard mentioned, were computed as an 80 per cent kill. This was obtained on Malagas sprayed when 60 to 80 per cent of shoots were four to six inches long, with three to five small but developed leaves besides the terminal bud.

Muscats sprayed when 50 to 60 per cent of the shoots were one to two inches long with two leaves unfurled besides the terminal bud, showed good effects, but had been sprayed too early to get the later-appearing larvae.

Tokays sprayed when buds had begun to swell, but very few had burst open, were frosted three weeks later, so the kill was not computed.

In all cases the leaves were burned but the fruit buds uninjured. Growth of shoots was delayed for three or four weeks, but at the end of a month the sprayed vines seemed as far ahead as the rest and the crop seemed not to have been injured except possibly the second crops.

his 10 acres. An automatic frost alarm rings at 34° F. and the oil is lighted soon or late according to rapidity with which the temperature has been falling. A home-made torch of gaspipe with a plug of cotton waste or lamp wick is made, to hold kerosene which supports a flame. A little gasoline is squirted onto the crude oil in each pot to get it started quickly. An extra line of pots should be placed just outside the orchard on the side from which air currents come on frosty nights. Temperatures can be raised several degrees in an hour if the air is still.

These pots are intended to produce a smudge, as well as heat which the smudge holds down, if it doesn't blow away. The smudge doesn't hurt deciduous trees as it would citrus foliage and fruit. In citrus districts they use pots which burn with very little smoke.

Lemon trees blooming and orange twigs sprouting in the midst of winter weather with frosts every night for a week, is a peculiar condition in sheltered spots in Tulare county.

Drakes and Nonpareils for Pollenization.

To the Editor: In the Rural Press of Dec. 30 I note the query of I. O. R., San Francisco, regarding pollenization of almonds. Your answer would not be conclusive and satisfactory to me were I asking the question. For instance, you advise mixing by grafting different varieties on the same tree and then caution him about mixing these varieties when harvesting. Those are hard lines to follow and with your kind permission I will advise I. O. R. in my own particular way. There has been a great deal written from time to time in the Rural Press concerning cross-pollenization of almonds and no one as yet has hit the right line of thought, according to my observation and experience. All seem to recognize the necessity of difference in varieties, but none seem to have grasped the ideas that the greater the difference the more successful the results. Consequently a perfect cross-pollenization would be a bitter hardshell with a sweet paper-shell. I know that such a cross brings the very best results other than that the bitter nut is not profitable, consequently is not to be considered. The next in line would be a sweet hardshell and a sweet paper-shell. With this cross you will get almost as good results as with the bitter nut, but again the hardshell is not a seller. About the hardest shelled nut that the trade will take and class as a softshell is the Drake Seedling, and absolutely the softest shelled nut we have is the Nonpareil, which is strictly a paper-shell. Not only do the Nonpareil and Drake differ greatly in shell, but they also differ greatly in style of growth and

general appearance of tree and blossoms. However, they both bloom about the same time, which is of course necessary. They ripen at different times, the Nonpareil being an early and the Drake a late variety. Eliminating theories, when these two varieties are planted together in alternate rows, the results are all that can be desired. Drake Seedling and Nonpareil I consider the one best bet. Consequently, my advice to I. O. R. would be by all means to graft his I. X. L.s—all of them—into Drake Seedlings. True, as you have said, Nonpareils and I. X. L.s are high-priced nuts; but price doesn't cut much figure if you have none to sell, and these two varieties planted together will not produce, more especially so as the trees grow older. The difference in price between the I. X. L. and Drake is more than made up in the difference in weight between the two varieties, the Drakes weighing about 20 per cent more than I. X. L. One year with another they will bring in more money than any other variety I have ever handled. The only good cross I have ever found for the I. X. L. is the Jordan Hardshell. The I. X. L. and Drake would make a very good cross if they bloomed closer together. As it is, the I. X. L. is a big help to the Drakes, but the Drakes do not return the favor to a very great extent. The reason for this is, I presume, that when the Drakes bloom there is still plenty of pollen in the I. X. L. to help them, but before the pollen in the Drakes becomes active the I. X. L. are past pollenization.

Lemon Gummosis Notes.

[Written for Pacific Rural Press.]

An insurance against gum disease and scaly bark, and a great help in keeping lemon trees healthy, is Bordeaux paste, according to the experience of L. G. Duval and Joe Southwell on the G. C. Powers ranch in Ventura county—also their observations in neighboring orchards.

Some of the Powers lemon trees were painted in 1914. The bark looked sunburned and cracked. In 1915 it did not seem necessary to repeat the application because the bark had freshened and become green and healthy. Last summer another "painting" was given. Spring application is preferred.

A neighbor had 20-year trees which two years ago had "an awful dose of gum disease," the bark was peeling off, and the trees going backward. He painted with Bordeaux paste, and now a fine growth of healthy bark is pushing off the old.

Mr. Duval was afraid to apply it to one-year trees so he asked Prof. H. S. Fawcett, who has recommended the paste so generally for gum disease, but Prof. Fawcett said to go ahead.

The Powers trees are painted from below the bud union to three feet up the trunk to prevent gummosis and to keep moss off in this region of much ocean fog.

Gummosis has been observed nicely started where distinct hoe cuts had been made in the bark at the

previous hoeing. Only Bordeaux paste can be relied on to prevent this, either by application when the wound is made, or by scraping off all diseased bark when discovered, and immediately painting the surface.

DATTIER DE BEIRUT.

To the Editor: I have some Dattier de Beirut grapes grafted on Zinfandel, which bear well; but too many small berries are intermixed in the bunches. I stake and prune them like Malagas. Is there any known way to increase the size of the berries? The bunches are large enough.—A. R. P., Dinuba.

[Answered by Prof. Frederic T. Biondetti, University of California.]

The production of small seedless berries is a common and very bad fault of the Dattier de Beirut. This defect is intensified in the cooler regions and in cool seasons, and it does not seem to be diminished by grafting on any stock that we have tried. It is possible that it may be counteracted by some method of pruning, cultivation, or irrigation, but so far we have been unable to improve the variety in this way. This year, the grapes were very good and almost free from this defect at Kearney, but in other places, where we have this variety growing, it is as bad as ever. The variety is probably suited only to the hottest regions.

Cherry Gummosis May be Prevented.

[Written for Pacific Rural Press.]

Gumming is simply thickening of exuded sap by exposure to air. The sap may exude for any of several causes, but one cause has been found, definitely in Oregon, to be due to bacteria. It seems worst at three to five years after planting the trees, and on the trunks or main limbs. It works under the bark, spreading far sometimes before breaking out. This characteristic has been noted on many trees in the Vacaville district and on old trees too.

The affected area quits growing, at least temporarily, and the growth all around it leaves a depressed "canker" later on. Often the bark hardens and cracks. Often, too, the trees recover naturally by growth of green bark over the affected areas.

In the bacterial disease, H. P. Barss of Oregon notes that it is most active late in winter and early in spring. By removing the outer bark from a rapidly spreading canker, the inner bark and even some of the wood are shown dead and discolored in the center; but away from center the discoloration is not quite so deep and at the margins of the canker, usually only the outer layers of bark are affected. Diseased tissue is permeated with gum which collects in the pockets under the bark, with pressure.

For Control, Prof. Barss recommends resistant stocks such as Mazzard, grafted with desired varieties into the branches, to get resistant trunks. Lambert has seemed more resistant than Royal Ann or Bing. He also recommends cutting out diseased bark and wood, sterilizing it with corrosive sublimate 1-1000, and covering exposed wood with grafting wax.

F. B. McKevitt writes:

"So far as I know, no remedy has been found for gummosis, which is especially bad in some seasons and is sure to be bad on low and poorly drained soil. I have found it good practice to cut out the spots of gum and to follow up the streaks in the bark secreting the gum, to a point where perfectly sound and good bark is struck. After having thoroughly cleaned the gum away, the wound should be coated with hot liquid asphaltum. In many cases this will temporarily, at least, give relief."

J. J. Fox, Horticultural Commissioner of Napa county, has noted gummosis on heavy soil showing up about the 5th year. He recommends similar treatment. A successful Santa Clara grower says, "The best treatment I have found is keeping a good cultivation and splitting the bark carefully." G. W. Worthen, also of Santa Clara Valley writes, "For gummosis, slit the bark longitudinally on north side of tree and apply lime-sulphur wash."

San Jose Scale is reported from Oregon as a cause of unthrift and excessive gumming. Says Prof. A. L. Lovett of O. A. C., "The base and main crotch of the tree and the outer limbs should be examined very carefully for scale, which, to the casual observer, will appear as small grayish or blackish specks scattered over the bark. A heavy infestation of the San Jose scale ap-

pears not unlike wet ashes spread over the bark. Where such condition occurs the back of the thumb nail should be drawn across the bark, when, if there is a yellow, oilish exudation, you may rest assured that the scale is present. For this pest there is nothing better than the early spring application of the commercial lime-sulphur spray. This spray should be applied in the spring just as the buds are opening, and before the leaves put out, using it at the rate of one part of the commercial lime-sulphur to ten parts of water. It is advisable to add the commercial black-leaf-40, a tobacco spray, to this commercial lime-sul-

phur, as by this practice one may also control the plant lice which are usually present on the tree in the spring. This should be used at the rate of one part of the black-leaf-40 to eight hundred parts of the lime-sulphur as diluted ready for spraying, or at the rate of two table-spoonfuls of black-leaf-40 to twelve and one-half gallons of the lime-sulphur spray solution."

PLANTING FIG CUTTINGS.

To the Editor: Would you advise placing fig cuttings in orchard form instead of rooted trees? Would there be any time saved, or would it be as well to start the cuttings in a bed and transplant when one or two years old? Young trees are not available in our locality this season?—W. A. A., Ceres.

Plant only rooted trees in or-

chard form. Your stand cannot be too good and it should not be bad, as it might be if you plant cuttings. Root your cuttings in a propagating bed for a year and get the use of your field for crops that will either fertilize and subsoil it, as alfalfa or sweet clover, or root crops, etc., by which it will be worked into good condition for the trees.

George H. Hecke, Horticultural Commissioner, plans to extend and enlarge upon the work of his department in various ways, the appointment of two additional field men, one for the north and another for the southern part of the State, being among his aims. He also hopes to appoint an assistant to Harry Smith, Superintendent of the State Insectary.

THERE IS BIG MONEY in APRICOTS!

Why?

BECAUSE either in the green or dried state, they are always in demand.

BECAUSE the market yearly consumes the entire output of both canned and dried apricots.

BECAUSE they grow rapidly and early bear a heavy crop.

BECAUSE THERE IS BIG MONEY IN APRICOTS.

FRESNO CAL. P.O. BOX 615.

Siloed Milo Stalks Replace Hay.

[Written for Pacific Rural Press.]

That the silo may be used to preserve a lot of material that would ordinarily be plowed under or burnt is shown by the experience of J. S. Moore whose ranch is located between Ripon and Manteca.

During the past fall Mr. Moore had a field of milo maize stalks, left after harvesting the heads for grain. As he was short of other filling for his 100-ton silo, he decided to try siloing the dry stalks for winter feed.

As the material was well dried out, it was necessary to run a stream of water into the cutter continually; and it was thought doubly important to do a good job of tramping. For that purpose a young colt was used in the silo instead of a man, his small, sharp hoofs packing the silage down in good shape. When the silo was filled he was hoisted out of the top with a block and tackle.

Regarding the feeding value of this stalk silage, Farm Adviser Frank Lyons says that Mr. Moore reports his milk flow equally heavy as it has been at other times of the year, notwithstanding the cold and wet weather which has been general since silo-feeding was started.

But of course the biggest value has been in the saving of other feed, the ration fed to the large Holsteins varying from 25 to 30 pounds of silage with all of the chopped alfalfa hay the cows will eat. The amount of hay also varies with the individ-

ual cow, but probably does not exceed 15 pounds in any case. It is fair to assume, therefore, that two pounds of the stalk silage is proving the equivalent to one pound of chopped hay. As to the cost of the silage, it has been the general experience of all of the silo owners in San Joaquin county that a dollar a ton covers the cost of cutting, hauling, chopping, and tramping silage. As the milo field had already been harvested and the stalks would otherwise have been plowed under, no charge, other than the harvesting and siloing, can be made per ton for the silage.

When Mr. Moore built his silo, his barn was an old one and not fitted with a feeding alley in front of the mangers, thus making the feeding of silage inside the barn an almost impossible task. To overcome this objection two rows of stanchions and mangers were built adjoining the silo. These are in the open corral. While they would be better if they were covered with a roof, they simplify the work of feeding to a considerable extent.

Another profitable use which Mr. Moore gets from his silo-filling machinery is the chopping of all hay before feeding. This not only makes a direct saving in hay, because of the small amount left in the mangers, but saves storage room as well, three tons of the chopped hay being stored where but one of loose hay can be cared for.

Rye Prevents Sand Blowing.

[Written for Pacific Rural Press.]

In a new arid country such as is still being tamed in many parts of California, there are many unusual problems to be solved. Not the least of these is to provide humus and stop the removal of farms by wind to the neighbors who do not want them. Blowing sand covers grain and alfalfa crops and cuts leaves from plants and young fruit trees.

Such a situation may be found in a certain valley of Los Angeles county which is only recently being reclaimed from the desert. Grain crops, principally wheat, had dwindled to 5 or 10 sacks per acre.

A student of conditions is Donald Graham of this Valley, and he has a "very efficient" solution. "This country lacks humus," says he. "Everything cries for humus. We have disked straw into the dry soil in the fall, but sand cut the leaves from young trees."

The wind blows from the southwest every afternoon from winter till July. Most of the heavy rains come in January. No rain this year since about an inch in October.

In the spring of 1915, Mr. Graham plowed in January, and sowed rye late that month and early in February at the rate of 20 pounds per acre. This did not make heavy enough growth and this year about 40 pounds of seed were used per acre. Seeding in November was tried in 1915 and the crop plowed under in March. At that time Mr. Graham said he would prefer sowing in October. Last fall 160 acres were sown solid, including 60 acres of fruit trees planted last year. The

100 acres will all be turned under in the spring, but in each row of fruit trees a six-foot strip will be left all summer, running as the water runs to avoid furrowing complications. The first year the strips were left north-and-south; the next, east-and-west with equal effectiveness. The seed was sown very deep and no irrigation given, but the October rains had brought it up about an inch tall. No irrigation is planned before turning the rye under. The strips will be left until fall when they will be disked and cultivated but not plowed, and sown again at once. The only objection is that coyote grass, tumble weeds, and Russian thistles are likely to require special attention; but prevention of sand blowing and addition of humus far outweigh this.

FOXTAIL-ALFALFA HAY.

To the Editor: Foxtail is so thick in alfalfa here that many are burning the first crop. Is it possible to cut it before the foxtail gets ripe, and would it make good hay if cut green?—E. M., Winters.

First-crop alfalfa badly mixed with foxtail makes better hay if cut before the foxtail gets ripe, but at best is rather poor. However the manager of a large ranch in Santa Clara county tells us that first-crop alfalfa mixed with foxtail made better silage than pure alfalfa. He had tried it.

One of the most encouraging things about sorghums is the success resulting from head-selection in the field.

Indian Corn in the Delta.

[Written for Pacific Rural Press.]

In 1915, Chas. B. Smith's 85 acres of yellow flint was the only Indian corn raised in his district of the delta land in San Joaquin county. In 1916 there were about 500 acres. In 1915, it cost over \$30 per acre to sack and deliver Mr. Smith's 60-bushel crop to town. In November, 1916, he was expecting to sack and deliver his 70 to 75 bushel crop from the same land for not more than \$25 per acre. In 1915 about two inches of grain was eaten from the ends of the cobs by worms. This year it averaged less than an inch. In 1915, the hoeing that he gave the corn cost \$7.00 per acre. This year it cost \$1.70 per acre. In 1915, the kernels on the ears were shallow; this year they averaged considerably deeper. In 1915, it cost a lot to raise the crop; for Mr. Smith was inexperienced.

Seed Selection.—Much of this year's improvement was due to personal seed selection. In the fall of 1915, seed was selected for its depth, early maturity, and heavy yield per stalk. Early maturity has the advantage of being ready to husk that much sooner. This year when seen early in November, the stalks were dry and Mr. Smith hoped the corn would be dry enough by November 15 to husk into wagons and throw directly into the crib. Earlier corn is still sought by seed selection.

Flint was chosen rather than dent because, he says, flint hardens earlier in summer and prevents the worms going down so far on the ear.

Last fall about Nov. 1, some Mexicans were husking part of the corn for tamale shucks and throwing the ears on the ground. Already many of the best of these and other early ears had been laid out on the crib floor to dry more perfectly. This was later to be re-selected by Mr. Smith for seed for 1917.

As it stood then in the field, 10 to 12 feet tall, a thick heavy stand, with two ears on each of a large percentage of stalks, it was surely a pretty sight. Most of the ears were smaller and the kernels shallower than the good dent corn of

the East, but one ear not greatly larger than the average had 14 rows of solid kernels and was about a foot long.

Cultivation.—After sheep had eaten considerable of the fodder of the 1915 crop, a stalk cutter was run over the field and a rolling coulter put in front of the plow. The land was plowed in March. Mr. Smith believes it should be plowed in winter and again in spring just before planting. The chopped stalks were turned under 9 inches deep last spring, and did not bother the cultivators.

Seed was planted, 8½ pounds per acre, finishing about Apr. 20. Mr. Smith wishes to emphasize the advantage of "checking" it in, 42x42 inches instead of drilling. This is to give the stalks more room, and to permit cultivation both ways. A bean planter was used the first year. Four cultivations and one hoeing were given. In July when the corn was commencing to tassel was when it needed water, which was supplied through ditches a spade wide and a foot deep 150 feet apart. The sediment-peat soil is such here that it is readily subirrigated. When the ground is too wet, the surplus water is pumped out with an electric pump.

Rotation with Beans and Potatoes.—Corn needs the same growing moisture as pink beans, according to Mr. Smith; and he wished to emphasize the fact that while his second crop on the same land was considerably better than the first, he intends to plant beans on this piece this year and potatoes in 1918, for he does not want to kill the goose that lays the golden (corn).

Mr. Smith believes that the price of corn in California must drop when we produce all we use for ourselves, because we always have been paying enough to get Eastern corn and also pay the freight on it to the Coast.

A. Frederick Hinz, pioneer rice miller, who introduced rice culture in California, died last week at the age of 74 years.

NO PLUMS ON THE FARM LOAN TREE.

Last week we briefly outlined the way in which the district farm loan banks were to be organized. On January 7 the following declarations were telegraphed from Washington:

The Farm Loan Board announced tonight its determination to eliminate politics entirely in the selection of the men who are to set up and operate the new institutions—the Farm Loan Banks. The board's statement, explaining that pressure is being exerted for the appointment of men of party influence, particularly Democrats, says:

"It may be stated without qualification that these jobs will not be handed out as political plums. The only consideration which will be taken into account is that of merit, efficiency and ability. There is no division of opinion among the members of the board as to this principle."

For each bank the board is to name five directors, from whom a president, secretary, treasurer and vice-president will be chosen as managing officers. In addition, there will be for each bank a registrar to act as fiduciary agent of the Government. The board announces that in making these appointments every effort will be made to get men whose fitness will commend them not only to farmers who must borrow money, but to investors, who must look upon the farm loan boards as safe and prime securities if they are to buy them and accept a low rate of interest. Secretary McAdoo has addressed the Governors of all states, urging that they recommend to their respective Legislatures the enactment of laws to make farm loan bonds legal investments for trust funds and savings banks where such laws are necessary.

BROOKDALE NURSERY,

Geo. N. Tyler.

Los Gatos, Cal.

Accident Liability of Ranchers.

To the Editor: If a rancher hires a man for a few days to do any kind of ranch work that may come up, and this man gets hurt while doing the work, such as losing an arm or an eye, is the rancher liable for damages? The man may have been hurt by his own awkwardness.—W. T. J., Shawmut.

[Answered by A. J. Pillsbury, Chairman of Industrial Accident Commission.]

The farmer is liable in damages for any injury to a workingman in his employment if the injury happened in the course of the employment, where it can be shown that it resulted from want of ordinary or reasonable care on the part of the employer or any agent or servant of the employer. The fact that the employee was himself guilty of contributory negligence does not bar recovery where his contributory negligence (awkwardness) was slight and that of the employer was gross in comparison. And in such cases the damages may be diminished by the jury in proportion to the amount of negligence attributable to such employee, but it is conclusively presumed that such employee was not guilty of contributory negligence in any case where the violation of any statute by the employer or his agent or other employee contributed to the injury. The only statute which an employer can violate is the one requiring employments and places of employment to be made safe.

Therefore, to sum the situation up we may say that whenever a farmer employs a hired hand he is responsible in damages if the hired hand is injured because the farmer did not give him a safe place to work or safe tools to work with or he was injured through the employer's negligence or the negligence of any member of the employer's family or any agent of the farmer or any other employee of the farmer. In short, the farmer is liable unless the employee was injured through his own inexcusable negligence, and the measure of the liability is whatever the jury may determine to be the damage done.

Now, there is another law known as the Workmen's Compensation Law which puts employer and employee in very different relations to each other as to injury. Under the Compensation Law the farmer is responsible for all of the injuries which his employee suffers while in the course of his employment without

regard to anybody's negligence. But the liability is fixed in advance at 65 per cent of the wages and medical and surgical treatment while the employee is laid up as a result of his injury or at three times his average annual earnings in the event of his death, leaving dependents. Up to the 8th of December, 1916, there were 11,710 farmers throughout California who had voluntarily accepted the compensation provisions of this Act. That is, they elected to be under compensation rather than under the law of damages based upon the negligence of the farmers or others in his employ, with the jury to assess the damages at anything the jury minded to assess. Practically all of the larger farmers of the State have seen the wisdom of coming under compensation and it is the belief of the Industrial Accident Commission that it would be wise if all the farmers came under compensation where the responsibility would be fixed in advance; they would be saved from law suits, and insurance costs no more for compensation than for liability against damages, and under either law, no prudent farmer will go without insurance.

Insurance coverage against all liability amounts to only \$1.50 on each \$100.00 of wages paid, not including the value of the board. That is, if a farmer pays an injured man \$25 a month and board, or \$300.00 a year, it will cost him \$4.50 in addition to insure him against all liability for injury and to make it certain that his employee, if injured, will be taken care of without any cost to the farmer beyond this \$4.50, and it will make no difference to the farmer whether he has one man for a year or twelve men for one month, the insurance coverage will be exactly the same.

In view of the fact that, at this writing, there are scattered throughout the State over 12,000 farmers who are operating under the Compensation Law and are satisfied with it, the time seems ripe to so amend the Act as to bring the rest of the farmers in. The Legislature will be asked to so amend the Act at the coming session and the Commission does not anticipate that there will be any serious objection to so doing. Under this law both farmers and their employees will be protected, if insured, and the cost of insurance will not be burdensome.

Gypsum for Alfalfa.

To the Editor: Regarding the use of gypsum and sulphur on alfalfa: Would it be better to mix sulphur and gypsum or use gypsum alone? How much shall I sow on heavy land on three- and four-year alfalfa? What is the right time of year to sow? What will it cost per ton?—Sub.

In June 27, 1914, issue, we printed a report of Prof. F. C. Reimer's experiments in Oregon, from which we gather that since gypsum contains sulphur, gypsum alone will be sufficient in your case. Apply whenever it will be carried down to the soil about the roots with rain or irrigation, but when there is but little danger of its leaching or being washed out of reach of the roots.

Use about 1000 pounds per acre. It is quoted now at \$8 per ton f. o. b. San Francisco in less than carload lots, with \$1 per ton rebate if sacks are returned in good condition.

It is said that the income of the ranches in the trading district tributary to Tulare for the year of 1916 has been estimated at \$2,000,000. Records of the creameries show that during last year the dairymen received \$986,000 for their butterfat. The grain crop marketed is put at \$422,000. Poultry products are put at \$250,000 and the shipment of stock and dairy cattle is put at half a million more.

ANIMAL FERTILIZERS

Put back into your soil the elements that your crops take from it. If your soil is productive they will keep it so. If it is partially exhausted they will restore its original fertility. If it is naturally poor they will build it up

There is a big food shortage and you owe it to the world as well as to yourself to make your land produce as much as possible.

GOLD BEAR FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

Let us help you solve the problem of bigger and better crops.

PLUNGER PUMP COUNTER-BALANCE.

In your issue of Oct. 16, 1915, there appears a very interesting description of a deep-well plunger pump, which for the quantity of water delivered and lift overcome, apparently consumes a very economical amount of power. This being a question of vital interest in this country where wells are deep and water has to be lifted all the way down to 100 ft., I would like a little more detailed information on this subject.

[The pump in question was raising water 80° to 90 feet. The plunger was attached to the end of a 3x12 plank, set edgewise at its center into the top of a post 6 or 8 feet high. On the other end were several bags of sand to help lift the water. Power from a small engine was applied to the plank about 18 inches from its pump-end, by means of a 4x4 whose lower end was attached to the wheel of a gearing run by the engine.]

The point I have in mind especially is the weight of the sand which is used at one end of the walking beam to help lift the column of water in the discharge pipe. Is there any advantage in making this greater than the weight of the pump rods plus what is required to overcome the friction of the water in the pipe? It seems to me that if the weight is made greater than this, the engine will be called upon to lift this greater weight on the down stroke when the column of water rests on the lower valve in the cylinder. Is that not correct? Now I have been contemplating installing a 12-in. diameter x 18-in. stroke cylinder which throws approximately 9 gallons per stroke, or on 30 strokes about 270 gallons per minute. My discharge pipe is 3½ in. which would give more friction than if I had a larger discharge. Under these conditions would there be any advantage to fix this pump up with a counterweight? I propose to set the cylinder down about 40 ft. Could the friction of this quantity of water in a 3½-in. pipe be overcome with the counterweight? The question of power is of course important in any country, but especially here where gasoline costs about 30 cts. per gal. laid down at the ranch.

As I have said, if there is any real reduction in the power required to run this style of pump it is of great interest to the settlers here, and this advantage may be great enough to overcome the extra care such pumps require in the renewal of leathers in the pumps. Another question I would like to ask in this connection is, whether there is any pump on the market with steel plungers and rings, similar to those in gasoline engines? If so is there any advantage in their use?—C. J. S., Stacy, Lassen county.

The object of the sand counterweight is to give the engine the same load on the up and down strokes. To do this, the weight of sand would theoretically be half that of the column of water plus the pump rod. Then, not considering friction, the sand would lift half of the weight of water and rod, while the engine would lift the other half. On the down stroke, the engine would lift the same weight in the form of sand on the other end of the balance beam. This reminds us, however, of putting a stone in one end of the bag to balance corn in the other end while the corn is being taken horseback to the mill. Double acting pumps may be obtained which lift water on both strokes, instead of sand on one of them.

GOVERNMENT SEEKS TEST FOR GASOLINE.

In a statement recently given out by the United States Bureau of Standards effort is made to correct two erroneous opinions generally held by the public regarding motor fuel. According to the report, specific gravity will not suffice as a check on gasoline when it is desired to gauge its value for use in motor cars. Just what is the proper test is still a matter of some doubt, and in this regard the report states:

"It seems most probable that the definition of gasoline will have to be based on the percentage that distills over between specified temperatures, when the distillation is carried out under specified conditions. This distillation test, speaking in non-technical terms, is a measure of the freedom with which the gasoline will vaporize. The gasoline must not vaporize too freely for two reasons—one that it would not be safe, and secondly, its loss in storage by evaporation would be too great. Hence, the specification may have to contain limitations of the percentage distilling over below a certain temperature, coupled, perhaps, with a proviso that certain percentages shall distill over below other fixed temperatures, in order that requisite amounts of low-boiling constituents shall be present to insure easy starting of an engine. Likewise the specification must contain a provision that all must distill over below a certain maximum temperature in order to exclude from the gasoline the heavier petroleum distillates, such as kerosene."

The report also informs the public that it must not expect the Bureau of Standards to take hasty action in formulating a gasoline test. It says:

"It is extremely important that we proceed with the greatest caution and in the light of the fullest technical information. There is only one way, or at most a very few ways, of doing the right thing, while there are an infinite number of ways of doing the wrong thing. A mistake of any kind, such as a specification that is unnecessarily restricted and which might unduly limit competition, will disturb economic and manufacturing conditions and might only result in imposing greater burdens on the consuming public."

"There are two aspects to the question under consideration, one local, the other national. There is no doubt that the advantages that would result from a satisfactory standardization of gasoline by the National Government are many. Not the least of these would be its influence on State and municipal legislation relating to this question, and its effect in making such legislation more nearly uniform throughout the country. Legislative bodies are beginning to take up this question, and much of this legislation is certain to be ill advised, although enacted with the best intentions, because it can not in the nature of things receive the careful consideration of technical

The Only Standardized Tractor Design

Avery Tractors are the only make built in five sizes (a size for every size farm) all having exactly the same design. There is practically no other make of tractors where there are more than two sizes of the same design.

When the Avery Company builds one size tractor and after thoroughly testing it out, builds another size, and then another, and then another, and then another, until it has five sizes of all exactly the same design, it is unquestionable proof of the success of that design.

Genuine Kerosene Burners

Opposed motor, strong crankshaft, renewable inner cylinder walls, patented sliding frame, all-gear transmission, no intermediate gear or shaft, no counterweights on crankshaft, no

water pump, no fuel pump, no fan, no mechanical lubricator, no belts, no sprocket chains. Regular sizes 8-16, 12-24, 18-36, 24-40 or 40-60 h.p. and special 6-10 h.p. There's a size Avery Tractor and Plow to fit every size farm and a size Avery Thresher to fit every size run. The Avery Company has its own Branch Houses at convenient points, large repair shops and force of trained service men to serve owners of Avery Tractors. Write for a free copy of the new 1917 Avery Catalog and name of nearest dealer.

experts that is required for the satisfactory solution of questions of this kind. It will readily be seen that the effect of indiscriminate legislation might produce conditions nothing short of chaotic."

GEARING ENGINE TO PULL STUMPS.

To the Editor: I have a 2½ h.p. gasoline engine with 6-inch pulley on fly wheel, engine runs 500 revolutions per minute, 4-inch belt connected on a 20-in. pulley attached to a hoisting apparatus with a back gear of 6 to 1 on a 2½-in. shaft winding a rope. What pull will I have on this rope as compared with the draw bar h.p. of a team or tractor? I want to pull some peach trees that are too large for an ordinary team. Do you think this kind of an outfit rigged on a heavy wagon will do the work?—F. C. G., Atwater.

[Answered by Prof. J. B. Davidson, University Farm.]

The scheme proposed by the correspondent is an impractical one, as there must be a still further reduction of speed in order to secure a pull of any value. A cable operated by the engine and apparatus proposed above will have a speed of approximately 182 feet per minute. At 100 per cent efficiency the engine will only develop a pull of 450 pounds. The draw bar pull of the tractor will depend somewhat upon the speed in which it is designed to travel, but should vary somewhere near the range of 150 to 200 pounds per tractor horsepower. If, however, heavy pulling is to be done with the cable apparatus arranged as suggested, it is best to have it mounted on skids rather than on wheels.

SMALL PUMP AND TANK.

To the Editor: I am contemplating putting in a pumping plant and I would like to know how large a tank I will need for house use and to irrigate 800 fruit trees. I expect to use a 5 h.p. engine.—R. J. J., Lincoln.

It would scarcely be worth while for you to put up a smaller tank than 1000 gallons, yet we know a rancher who has that sized tank for house and dairy use and to irrigate 400 fruit trees besides 10 acres alfalfa and some corn and grain. He uses a 3 h.p. motor and a 2½-inch centrifugal pump with a four-inch discharge. He previously had a three-inch discharge and it took nearly four horsepower to run the pump. A five-h.p. engine would lift 200 gallons per minute 50 feet, part of the 50 feet being lost by pipe friction.

CLEARING BRUSH ON A LARGE SCALE.

At the World's Fair was exhibited a machine for the wholesale clearing of brush land. It was to be hauled by a tractor. The first segment was an iron roller seven feet wide which humbled the brush. Next followed a frame with underground plowshares V-shaped to cut the roots. Following that was a "hay rake" twelve feet wide with solid-faced seven-foot wheels and teeth that dug into the ground several inches. A machine like it had been used to clear 18,000 acres in Nevada. We now have a note of one being used for scrub oak, manzanita, and greasewood in Santa Barbara county. In this case, however, instead of a roller, three railroad rails fastened together are dragged over the brush; and eight 12-inch plows

All Kinds of Irrigation Appliances

In these days of high prices and shortages of all manufacturing materials. It gives us pleasure to announce that we have a full supply of Irrigation Appliances on hand at convenient distributing points all over the Pacific States, and are prepared to make prompt deliveries through out the season.

We are the pioneers in this business, and the largest manufacturers of Irrigation Appliances in the world. Years of experience have taught us how to make the best possible goods at a fair price.

followed by the rake are taken at a separate trip.

AUTOMOBILIST REDUCES COST OF SOLES.

To the Editor: The high cost of sole leather has no terrors for me. I have a substitute that outlasts sole leather, is cheaper, less trouble to apply, and water does not soak through it.

As I have an automobile, I used a piece of an old tire casing to half-sole my shoes. I just cut a piece of tire crosswise to fit the shoe sole and nail it on. Motor and bicycle tires for the kiddies' shoes. Don't sell your old tires to the junk man. Arbuckle. Al Fairbanks.

POWER FOR PUMPING.

To the Editor: Will a ten-horsepower engine pull a six-inch centrifugal pump volume of water through an eight-inch pipe 700 feet long with a total head of about 20 feet?—S. N., Middletown.

Your pipe friction will equal a 15-foot head. To lift the 900 to 1000 gallons per minute, able to be delivered by a six-inch pump, will require about 17 h.p. This includes both the 20-foot lift and the friction head.

The 1917 Studebaker Almanac, besides containing the usual almanac information, has considerable to say about the care and upkeep of automobiles, what to do when things go wrong, etc. Information on electric motors and gas engines are also indexed in a way to make this almanac of value to power users. Dairymen and stock raisers are re-

General Agricultural Review.

FIELD CROPS.

Bacon Island, San Joaquin county, potatoes are reported to be bringing the growers \$2.50 per sack. If weather permits digging will be completed shortly.

The annual convention of the Northern California Beekeepers' Association met in Sacramento recently, and after discussing important problems elected new officers.

The U. S. Dept. of Agr. reports that after eight years of experimentation with yellow-flowered alfalfa they feel the plant cannot be recommended for general cultivation.

Seventy-five thousand acres of rice were planted in California in 1916, but owing to the damage done by early rains and heavy winds only about 60,000 acres were harvested.

The sugar beet acreage harvested in California in 1916 was 25 per cent larger than that of 1915. The 1916 prices averaged approximately \$6 per ton compared to \$5.40 per ton for 1915.

With over 15,000 acres of beets guaranteed and 25,000 acres more in sight the owners of the Visalia and Corcoran sugar factories are predicting a season run at these two factories above any yet enjoyed.

J. B. Neff of Anaheim, while in our office last Saturday, reported the Farmers' Week at the Agricultural College at Corvallis, Oregon, during the holidays, a great success. Fully 1,000 farmers registered.

W. H. Delphy, a rancher near Chino, is said to have grown the largest pumpkin ever grown in that district. It looks as big as an ordinary wash tub. Its actual circumference is said to be eighty-six inches.

The ranch of Andrew Kaiser, near Orland, has 350 acres in alfalfa. Mr. Kaiser contemplates adding 400 acres adjoining land, which will also be sown to alfalfa. It is intended to market the alfalfa in the shape of prime beef and pork.

At a meeting of hop growers held in Sacramento recently it was decided that the proposed California Hop Growers' Ass'n must be capitalized in order to provide growers with funds and keep them out of the hands of the dealers.

According to reports, a number of the ranchers of the Poplar district of Tulare county are contemplating the planting of sugar beets to a considerable acreage, the soil of that district being particularly adapted to beet culture, it is said.

State Horticultural Commissioner George H. Hecke has issued a quarantine order prohibiting shipment into California of alfalfa hay, cereals, straws and potatoes, except when screened and in fresh sacks, from Utah and certain counties in Idaho and Wyoming.

The British government has requisitioned 105,000,000 burlap bags from Calcutta mills, covering a period from January to March. Importers believe this will have the effect of still further reducing supplies landed in the United States early in the year.

Reports from Ducor, Tulare county, state that the estimated value of barley grown in that district in 1916 is \$500,000. The grain was sold on the average for \$2.50 a sack. Practically all grain grown there is said to be out of the growers' hands now.

State Horticultural Commissioner George H. Hecke has issued a quarantine against new chestnut stock entering this State. The quarantine brings out the point that imported chestnut stock invites careful examination, principally underneath the bark, where the fiber of the main trunk is found to be "punky."

Petitions are being circulated in Ventura county for the retention of the farm adviser, according to developments before the board of supervisors. A compromise movement is under way consolidating the three offices of forester, farm adviser and horticulturalist into one, the money saved to be expended for road work.

Preliminary steps toward the organization of a Farm Loan Association under the Rural Credits Law has been taken by some thirty or forty land owners of Solano county. Much interest is evinced in the matter. It is proposed to divide the county into three or four districts for the development of the association.

Santa Ana says rain was never more welcome than the recent one. It brought relief to foothill pastures and put the soil in excellent condition for the sugar beet men to plow and plant and the lima bean men will more easily work their ground to conserve moisture for planting in May. Orchardists and gardeners also welcomed it.

DECIDUOUS FRUITS.

Plans for the establishment of a peach-packing plant at Hanford are under way.

The large cannery of Libby, McNeill & Libby at Selma will be enlarged to almost double its present capacity before another fruit canning season begins.

Apricot fruit buds in the Ontario-Pomona District are heavily set and very plump, nearly double what would be required for a normal crop if all should mature fruit.

According to estimates 35,000 tons of prunes were produced in the Santa Clara Valley last year and the production of the balance of the State was about 33,000 tons.

Announcement is made that a \$20,000 peach-packing house will be erected at Reedley and an addition to the plant at Selma costing \$10,000 will be started before Feb. 1.

Frank Swett of Martinez reports a very heavy demand for almond and apricot stock. He says that prunes, pears and walnuts will also be set out in large numbers this season.

Articles of incorporation have been filed by a company to be known as the Bakersfield Canning Co. at Bakersfield. They propose to erect a fruit canning plant at Bakersfield.

County Horticultural Commissioner Fred K. Howard of Kings county reports heavy receipts of prune, apricot and peach trees dur-

BIG SEED COMPANY IS DISTRIBUTING NEW CATALOG

AGGELER & MUSSER SEED CO.,
Of Los Angeles, Issue 24th
Annual Book.

One of the largest seed houses in the West, the Aggeler & Musser Seed Company, Sixth and Alameda Streets, Los Angeles, have just received the first edition of their new 1917 catalog, and are giving it broadcast distribution. This is their 24th annual catalog and it certainly surpasses any previous edition.

It contains many new features, such as hints to the home vegetable gardener, how gardening may be made easy, etc. In fact, the supplementary booklet called the "Garden Manual," which heretofore has been printed separately, is this year incorporated in the big annual, and is claimed to be one of the most complete seed books published. It contains answers to more than 1,000 questions, and gives information regarding all varieties of plants listed and is fully illustrated. Not only does it tell all about seeds, but gives full data concerning the correct tools and implements agriculturists should use to obtain the best results. Valuable hints on poultry, spraying, fertilizing and the use of insecticides are also given.

The Aggeler & Musser Seed Company will gladly send this descriptive, illustrated and interesting catalog free and postpaid to anyone writing and requesting it.

CORY'S MAMMOTH THORNLESS Blackberry

ing the past month for planting this season.

Fred P. Roullard, county horticultural commissioner of Fresno county, has appointed James A. Armstrong of Selma as deputy horticultural commissioner of Fresno county.

A report from Kingsburg states that orders are coming from the East for large amounts of the 1916 fruit pack and that it is thought the 1916 crop of canned fruit will be moved at good prices.

Fig land is being sought for in the Oroville section and contracts have been made for next year's crop at as high as \$115 per ton. Shipping plums are being planted as a filler in olive and fig orchards.

A representative of the Tulare County Growers' Ass'n has mailed contracts to peach growers in that district offering to pay \$16 a ton for freestones and \$20 a ton for clings during the coming canning season.

Kings nurserymen are predicting a brisk inquiry for all varieties of deciduous trees this year. Nurserymen say that the excellent prices that orchardists have been getting this last twelve months have resulted in numerous ranchers deciding to put in fruit trees.

CITRUS, NUTS, SEMI-TROPICAL.

Porterville estimates its frost damage to citrus fruits at 6 to 7 per cent.

Some San Bernardino county citrus trees have had young growth nipped by frost.

Packing houses in Tulare county expect to reopen for operation by Jan. 8, there being about 1,000 cars of fruit yet to ship.

Orange picking is now in full blast in the Redlands district and the fruit, it is said, was never finer. The crop is estimated at 4400 cars.

It is said that two ten-year-old olive trees at Holtville produced two barrels or 100 gallons of olives, 700 pounds, worth \$63 at the lowest market price of \$190 per ton.

Over 500 acres in the vicinity of Linden, San Joaquin county, have been purchased by San Jose people, and what was once a series of grain fields will soon become an immense walnut grove.

Nurserymen in San Joaquin county estimate that 1500 to 2000 acres of almonds will be planted in that county the coming season. It is said that there are 3000 acres of almonds in that county now in bearing.

The California Walnut Growers' Ass'n now comprises 2400 growers and handles around 75 per cent of the crop. Hereafter the association will not only handle all of the first-class nuts but all of the by-products as well.

Officials of the Redlands-Highland Orange Association, after an inventory of the groves belonging to the Association, show that the series of cold nights during Christmas week resulted in no appreciable damage to either the trees or fruit.

The Department of Agriculture has perfected a citrus fruit-peeling machine and developed processes for pressing and chemically treating the peel whereby an oil equal in quality to the imported oil may be produced at a cost to enable competition with the foreign product.

Practically every citrus fruit-growing section of consequence in the State will be represented at the coming Seventh National Orange Show, to be held at San Bernardino February 20 to 28 inclusive. It will be the most beautiful, comprehensive and elaborate exposition of its kind ever held.

Smudge pots saved a crop of 5,000 to 6,000 boxes of lemons for C. W. Buswell of Tulare county during the recent heavy freeze there. The pots were used continuously for 10 nights and Mr. Buswell states he is sure the crop would have been totally destroyed had it not been for the smudge pots.

A movement is on foot among orchardists of the Porterville district to have passed at the session of the next State legislature a standardization law which it is thought will be acceptable in all parts of the State.

Under this law standardization will be based on hygrometer readings, and oranges will be considered fit to ship when a spindle reading of the juices of the fruit gives 11 and 12 deg. irrespective of the acid content.

Livestock Facts and Fancies---XVI.

[By the Editor.]

Last week we gave quite a sermon on the troubles in stock-selling in California with the hope of making the coming meeting of the California Swine Breeders' Association (to be held January 18 and 19 in Los Angeles) as largely attended and important as possible. We are glad to know that this purpose is likely to be attained, for an attendance of possibly 500 is being anticipated. While we are waiting for that assembly to bring out much significant information, we can proceed with a few points on the general American situation in selling meat animals.

One has only to read the discussions of stock marketing in all parts of the country to become convinced that California is not alone in this problem of selling animals with fairness to the grower, though possibly California may have the worst end of it. Growers are evidently sore all over the country and all kinds of growers are sore, for the great range companies are crying to the government for help and the little farm producers are organizing co-operatively to such an extent that they have in some states actually hundreds of neighborhood associations which are trying to escape the clutches of country-buyers by joint car-lot shipments and are reporting considerable gains in price and reductions in cost in that way. Thus it appears that California is mired down, in this matter of selling livestock, in the same slough with growers in other states. If she is deeper in the mire, she should not be hopeless: it will probably only need a stronger rope and greater team work to pull her out. How shall this be done? Why bless you, patient reader, if we knew that, we would not be using so many words and showing so clearly that we do not know. If we had a prescription describing a sure cure for present trouble, nothing but a motorcycle could get us to the drug shop fast enough, and we would pour the stuff into all open mouths we could find, even though they were as many and as deep as "crater-pits" on the devastated farms of Belgium. The truth is we do not know what should be done nor how to do it. We are only sure that something has to be done, and done rather quickly, if California is to get what belongs to her in livestock development.

We have an idea that there is no one thing that can be done to make all producers sure of getting their rights in selling. It is more likely that several things ought to be done—perhaps not all at once, but in succession. It is not clear that all growers would be advantaged by the same course of action or by the establishment of the same agency or institution. For instance, our own H. A. Jastro, who not only handles large production and trade in his own way successfully, has, if we refer to him justly, made no concealment of the fact that he is not in favor of an open selling place like a "stock-yard," as a privately or corporately owned selling place is generally called. Mr. Jastro not only controls many thousands of

cattle on many hills in California, but he is the leader and exemplar of the whole range interest of the country. We quoted last week a resolution supporting Mr. Jastro's views as to what in general should be done for fairer stock-selling in this country. At the Chicago conference there was also a declaration made by E. L. Burke, prominent ranchman of Omaha, and Mr. Jastro's associate as a member of the Market Committee of the American National Livestock Association. Mr. Burke made a plea for support of the Borland Resolution requiring the Federal Trade Commission to make a thorough investigation of costs in the production and handling of cattle and its by-products. Mr. Burke also said something like this:

You already know of the rapid concentration during the past twenty years of buying power into the hands of a few large units; and on the other hand the tendency toward smaller and weaker units among the producers. You also know of the very unsatisfactory conditions that have prevailed for years at the market centers and that conditions had steadily been growing worse until a crisis was reached in 1914 and 1915, when conditions were so unsatisfactory among the feeders of the country that thousands were going out of business because they could not afford to stay in the game. During this time the large packing concerns were making their greatest profits in history.

At the same meeting M. L. McClure, of Kansas City, Mo., president of the National Livestock Exchange, said this:

If the present system of marketing on central competitive markets is the best, it should be supported, and the efforts of certain packers in trying to break down the price-making system by going to the country to buy their supplies should be discouraged.

He urged producers to refuse to sell to agents sent to their farms and ranches, and continued:

No packer would send to the farms unless he could buy cheaper there than in a competitive market. What is said of selling in the country is also true of the custom of shipping direct to the yards of private packing houses and letting the packer fix the price he will pay.

This seems to be equivalent to saying to the packers, with reference to buying on the ranches or in their stock yards: "You'll be damned if you do and be damned if you don't." The explanation is reasonable enough from the large range point of view, viz.: that there should be truly competitive stock yards under government supervision or the range interests should become their own packers in co-operative establishments and they expect a government investigation to show that one or both of these things is necessary.

Now while we presume the claims of the large range interests are rational and perhaps necessary from their point of view we are not at all sure that their ideals are at all practicable or attainable to the growers with fewer cattle and less money. We are inclined, at this moment at least, to think that a central selling place, even if it is established and maintained by a capitalist or a corporation who is enriched by its operation, will return the small grow-

ers more than they now get from the local or traveling buyers. It usually takes more corn to feed a bunch of small hogs than one or two big ones. Again we are not satisfied that making up community carloads and shipping to a packer, to be graded and priced by him, will not get nearer what good stuff is worth than to have a local buyer handle a community product in his own way. A large concern with a reputation to uphold may not have any more conscience than a small jockeying buyer, but it takes a lot of time to educate a large staff to be crooked and then crookedness is apt to return upon the educator like a boomerang. Reasonably honest operation is not only better, morally, but it is easier and the larger the business, the easier it is. We would rather fight a big, bold devil handicapped with business requirements than a pack of little ones which had nothing to save or lose.

For these reasons, and others like them, we are not sure but hundreds of small growers might do better by studying ways to get nearer to the large buyers we now have than by trying to displace them, though it may be reasonable enough for the great range interests to try to do this.

Of course the establishment of open markets at several points, as is proposed in the extract outlining Col. Weinstock's policy as State Market Director, which appears elsewhere in this issue, is ideal in many respects. The doubtful point is what will be the attitude of buyers toward such establishments. If large buyers need stuff they will go to them, as good business will require them to do, and they will nat-

urally take what they need and leave the rest to be scrambled for by local butchers or feeders who have forage to work up. It is not to be expected that these markets will be overstocked at first. Growers will be held back by their own doubts, by their obligations or friendships to and for the old traders and all the other things which make it impossible to make a drive of farmers toward anything, no matter how desirable. Heaven itself has to be content to get them one at a time. We presume Col. Weinstock will present his plan in detail at the convention in Los Angeles on Jan. 18 and we hope it will receive most careful consideration.

SUDAN FOR COWS.

[Written for Pacific Rural Press.]

Among those who are trying out Sudan grass as a feed for livestock this year is J. W. Goodnight of Kings county, who had five acres planted, part of which is on rather heavy soil and part of which is on a sandy knoll. Planting was done about the middle of March and by August 1 one crop of hay had been harvested and another was ready to cut; and this without irrigation. The stand, however, was not as good as it might have been. At the above date none of this hay had been fed as it was all being stacked for winter feeding; but last year Mr. Goodnight found that the cow fed Sudan from a small patch did just as well as on alfalfa and seemed to like it equally well.

By lining the horse stalls with three or four inches of sawdust, the other bedding will last longer and the valuable liquid manure will be saved.

New Livestock Marketing Methods.

[From Annual Report of State Market Director Weinstein.]

In the marketing of cattle and hogs the small farmer is obliged to sell to itinerant buyers who visit him at more or less irregular intervals, to ship to large centers on consignment. If he ships on commission he is at the disadvantage of being obliged to accept whatever is remitted to him. [Further disadvantage of high freight rates on small shipments and of dealing with shrewd bargainers are pointed out. —Eds.]

The ideal marketing condition, in the interests of the small farmer who has livestock to sell, is to have local organizations, the members of which can deliver their few head of stock at a central shipping point on a given day, in order to ship in carload lots, these to be transported to stock yards, located at convenient points for the assembling of the buyers.

The associations would be represented at such stockyards by the selling agents, who being expert livestockmen would grade and segregate the livestock and invite bids from the various buyers, selling for spot cash to the highest bidders. The approximate cost of selling under such a plan would not exceed 1½ per cent commission, which would include compensation to the selling agent and the feeding and housing in the stockyards.

Under the foregoing system the small farmer then would get the benefit of carload rates on his few

head of livestock and would enjoy all the advantages of having his stock properly graded and sold by expert salesmen, thoroughly informed as to market conditions and in a position to meet, on an even footing, the expert buyers for packers and others. He would secure all these advantages at the least possible cost and his sales would be made practically for spot cash.

It is my purpose to endeavor to have this plan carried out at the earliest day. To accomplish the desired end, it will be necessary to enlist private capital in the establishing of stockyards in suitable locations in various parts of the State. It will also become necessary to organize the farmers into local livestock associations and then federate them into State livestock marketing associations.

I am at present in correspondence with parties who are interested in the establishing of stockyards and there is now a strong likelihood that in due course the first of such stockyards will be established at some convenient point in the Sacramento Valley.

If the first effort in this direction can be made a success I anticipate little difficulty in duplicating the plan in other parts of the State; and when this shall have been accomplished I feel that the problem on the part of the small farmer in successfully marketing his livestock, will have been largely solved.

It pays to dispose of all ewes before they become too old. About eight years is the age limit.

Groom, rub and brush the legs well before leaving the team for the night.

Breed for Butterfat

Beryl Clothilde Hengerveld, Champion in Butter-fat Contest, Sacramento, 5-day record, 21.11 pounds, test 4.7 per cent.

The quickest and surest way to make your Holstein herd more profitable in spite of high cost of feed is to introduce blood from high-testing ancestry.

My herd has a larger percentage of high-testing cows than any other herd in the State.

My young herd bull, DUTCHLAND SIR PIETERTJE CREAMELLE, has high-test breeding, and is transmitting this breeding to his sons and daughters. Our tested daughters have records averaging 21 pounds, all testing better than 4%. One of these, Clothilde Pontiac Creamelle, is California Champion 2-year-old, with a record of 22.52 pounds at 2 years 1 month; test 4.72%.

Have a few fine young bulls that will soon be ready for service. WRITE OR CALL AND SEE THEM.

F. STENZEL

Breeder of High-Test Holsteins.

SAN LORENZO,

CALIFORNIA

El Dorado

Holsteins

My herd consists of 15 A. R. O. cows and 25 registered heifers, all selected females. Bull calves from such cows and sired by a son of a 33-pound cow are worth consideration when buying foundation stock. **SEGIS PONTIAC DE KOL BURKE LUIT**, now heading my herd. His dam, Luit Burke, has an A. R. O. record of 32.76 pounds butter in 7 days as a junior 4-year-old. She is a full sister to Riverside Sadie De Kol Burke—32.29 pounds butter in 7 days. His sire, Segis Pontiac De Kol Burke, is the senior sire of the A. W. Morris & Sons, Inc., herd, and was grand champion bull at 1916 California State Fair.

CORRESPONDENCE SOLICITED.

ALEX WHALEY

TULARE,

CALIFORNIA

Examine Backs of Cattle for Lumps.

The characteristic lumps or swellings which may be found under the skin on the backs of many dairy and beef cattle from January until April contain grubs. If these grubs are allowed to remain, they will complete their growth, drop to the ground and transform to heel flies which may reinfest the cattle during the spring and summer, according to T. J. Talbert of the University of Missouri College of Agriculture. The grubs weaken the cattle, cause them to fall off in flesh and milk, and decrease the value of the hide. The meat in the immediate vicinity of a grub becomes slimy and of a greenish color, and is known to the butcher as "licked beef." On an average the damage to the hides is placed at one-third their value and the loss of beef to each infested animal ranges from \$3 to \$5.

The grubs may be pressed out through the opening at the top of the swelling. A sharp knife and a pair of tweezers will often facilitate the work of removing the grubs. Care should be taken to crush all the grubs removed, to prevent their further development and transformation into flies. It is advisable to examine the cattle for lumps or swelling over the back every two or three weeks during late winter and early spring to detect the pest. Various oils are often used. The lotion is either smeared over the infested region, or applied to the mouth of the breathing hole of the grub. One or two applications will usually be sufficient. The objection to this method is that the wounds do not heal readily unless the grubs are

removed—the source of irritation.

Some have claimed that the arsenical and coal tar dips can be used in the case of large herds which can not readily be treated by direct removal of the grubs. It still remains to be determined, however, whether practical means of eradication can be made by the use of dips. Dips applied during spring and summer will no doubt kill many maggots, and eggs which are attached to hairs on the animals' bodies.

The adult of the ox warble is a fly about half an inch long, very hairy, and resembles a small black honey bee. The females in depositing their eggs on cattle worry and torment the animals and frequently cause them to stampede for shelter or water. The fly does not sting or bite, but the animals seem to have an instinctive dread of its approach just as the horse has for the bot-fly.

Fish oil, train oil, and other substances are often recommended as spray to keep off warble flies. To be effective, their use would have to be continued during spring and early summer, and such a practice would be difficult and expensive and impracticable except in the case of small herds of valuable cattle. The flies do not appear to attack cattle which stand in water or in dense shades.

A horse's bit should be neither too wide nor too narrow, the bar or mouthpiece reaching about the width of two fingers above or behind the corner teeth.

Time to think about a silo!

This is the month when a lot of men decide to order silos. They see how the cost of hay and feed puts a crimp in their bank-account. Around them neighbors with silos are living easy. They have a big fat cream check coming in every month.

Look around—talk with men who have an

INDIANA SILO

Have them tell you how the Indiana saved their frosted corn last Fall. How the sweet, succulent silage is keeping their cows sleek and contented. They don't worry over the high cost of feed, and there's no drudgery connected with the feeding.

I am tired of paying high feed prices every Winter. Send me your free Silo Book.

Name Address

Largest Silos Most Economical.

[Written for Pacific Rural Press by Wm. Curtis Clark.]

The question has risen in the minds of some dairymen as to whether it is better to build two small silos or a single large one.

Where the herd is sufficiently large to utilize the larger silo, with no spoilage, it will be apparent from the figures herewith given, that there is great economy in one large silo, as against two smaller ones of equal capacity.

Some people think that the saving of time and the greater facility with which silage may be fetched out of a small silo operates in favor of those whose diameters are 16 feet or less. However, by using two sets of doors, placed on opposite sides of the silo, an 18- or 20-foot silo can

A silo buyer spends his money for storage capacity by the ton. In column 5 of Table 2 we find that the cost per ton of storage space is \$4.39 in a 10-foot silo while it is \$1.96 in a 20-foot silo, or \$2.16 in a 20-foot silo equipped with double doors. In other words, the same dollar buys more than twice the storage space in a 20-foot silo than it does in one of 10 feet.

Again we find that in columns 3 and 4, the capacity of a 20-foot silo is 242 tons, which is exactly equal to the combined capacity of a 16-foot plus a 12-foot, but the difference in price makes a saving of \$181, besides a saving of 40 per cent in cost of foundation, 42 per cent on cost of

TABLE I.
Minimum Rate of Daily Feeding from Silos of Different Diameters to Keep Silage Fresh.

Diameter in Feet....	Summer pounds.	Winter pounds.	Required Number of Cows.					
			Summer			Winter		
			40 lb. ration	30 lb. ration	20 lb. ration	40 lb. ration	30 lb. ration	20 lb. ration
10	525	263	13	18	26	6	9	13
12	755	378	19	26	38	10	13	19
14	1030	515	26	34	52	13	17	26
16	1340	670	34	45	67	17	22	34
18	1700	850	42	57	85	21	28	42
20	2100	1050	53	70	105	27	32	53

be emptied as easily as one 10 feet in diameter.

When silo doors are closed at filling time, it is a good plan to put a smear of axle grease or cup grease in the door jamb angles as the gas pressure of the fermenting feed has a tendency to force small bubbles through the door contacts before the wood has fully expanded to hermetically seal them.

With carefully closed doors, there should be a negligible spoilage of the contents at these joints. It is

freight; and the larger double-door silo will be as easy to empty.

In column 9 we find that there is 5 inches of contact with the silo wall for each square foot of surface silage exposed in the 10-foot silo compared with 2½ inches per square foot in the large size.

Most of us have reversed and reset redwood fence posts known to have been originally set in the ground fifty or more years ago. I have been impressed many times with its remarkable durability, and

TABLE II.
Comparative Cost of Storage Space in Stave Silos of Different Diameters.

Height....	Diameter....	Tons Capacity....	Cost....	Cost per Ton....	Founda- on ft. of ton sizes under 100%.	Shipping Weights....	Weights Per cent....	Circum- to Surface....
36	10	61	\$268	\$4.39				5 in.
36	12	87	317	3.65				4 in.
36	14	119	338	2.84				3½ in.
36	16	155	389	2.51				3 in.
36	18	196	426	2.23				2½ in.
36	20	242	475	1.96	100%	12500	100%	2 in.
36	18 plus 10	266	704	2.76	110%	17900	113%	
36	16 plus 12	242	706	2.92	140%	17800	142%	
36	14 plus 14	238	676	2.84	140%	17600	141%	
36	12 plus 16	212	525	2.46	100%	12500	100%	

*Silo equipped with two sets of doors.

also a fact that there is less circumference to a large silo in proportion to the exposed silage surface, hence the chance of spoilage around the edges is proportionately less in large silos.

From Table I, it is apparent that one must have at least 27 cows to feed over the winter months or 53 cows over the summer months in order to use a silo 20 feet in diameter, giving 40 pounds of silage daily to each cow, and so on.

In this connection it is interesting to notice how many of our dairymen are using this material for purposes of silo construction.

DIGESTIBLE NUTRIENTS OF SEVERAL FEEDS.

To the Editor: What is the percentage of dry matter and digestible carbohydrates, protein, fat, and ash in ground alfalfa, wheat middlings, rolled barley, buttermilk, tankage, and mangels?—A. P. Dixon.

[Answer adapted from "Woll's Handbook for Farmers and Dairymen."]

Feed	Digestive Nutrients of Several Feeds. Percentages of Protein, Carbohydrates, Ash, Etc.				
	Dry Matter	Ash	Fat	Protein	Carbo- hydrates
Ground Alfalfa....	91.6	7.4	10.3	41.4	1.1
Wheat Middlings....	87.9	3.4	12.2	47.2	2.9
Rolls Barley....	89.1	2.4	9.5	66.1	1.2
Buttermilk....	9.9	1.7	3.9	4.0	1.1
Tankage*....	93.0	15.9	50.1	26.1	11.8
Mangels....	9.1	1.1	1.1	4.8	2.2

*Productive Feeding of Farm Animals, Woll.

These figures are averages of many analyses of each feed, but the feeds vary so much not only in moisture content but also to less extent in composition, that any lot of feed may vary somewhat from the values shown in the table. The ash or mineral matter is of vital value in making bones, teeth, etc.

IS IT THE BUSINESS, THE COW, OR THE MAN?

[Written for Pacific Rural Press.]

A farmer in our presence recently made this statement: "There are too many dairy cows in our country. I have run a dairy for several years; had a lot of money tied up in expensive equipment and stock, endured all sorts of labor troubles and got mighty small returns."

The same week we visited a large dairy, where a mixed bunch of mongrel-looking cows were being milked. Owing to the owner's absence we questioned the two milkers about the daily production of the herd and were informed that the 80 cows being milked were giving about 50 gallons of milk twice a day; a trifle over 10 pounds per day on the average of less than four per cent milk, or under four-tenths pound of butterfat per day per cow. This on alfalfa hay that was being hauled a long distance, together with corn silage.

The next week we talked with a dairyman from Humboldt county where, as he said, "most of us have made our money dairying." In previous visits to his county we had learned that they not only dairy, but they expect to dairy for all time, and, as a result have so bred their cows that many expect 300 pounds of fat yearly as a minimum for every cow in their herd.

Asked as to feed conditions, he said they were none too good; that practically every dairyman in his district had shipped \$20 alfalfa hay from San Francisco and river points the past year, but even then they could make "a little money."

Here's three experiences. Is it the business that is poor, the cow or the man?

The bull calf should be taught to eat as soon as possible. He will begin to nibble grain and hay or grass at two weeks of age. He should be fed quite liberally on grain in connection with his skim milk and hay. For grain, barley with oats and bran or oil meal gives good results while alfalfa or other leguminous hay is best.

\$25 RURAL PRESS PRIZE GOES TO SANTA CLARA COUNTY.

Prof. F. W. Woll advises us that Bohnett Bros. of Campbell, Santa Clara Co., were winners of Pacific Rural Press prize of \$25 in the California State Dairy Cow Competition for the month of December. The average production of the five grades for the month was 1085.4 pounds milk and 49.319 pounds butterfat. The production of butterfat for individual cows was as follows: 77.578 pounds, 50.816 pounds, 24.458 pounds (for 14 days only) and 41.01 pounds (for 19 days). Particulars of the prize-winning herd will appear in an early issue. If you have not already entered your cows for this prize, do so at once by addressing Prof. F. W. Woll, University Farm, Davis.

California Swine Breeders' Meeting.

To all hog raisers who want to know why they are not getting better prices the meeting of the California Swine Breeders' Ass'n in Los Angeles Jan. 18 and 19 will afford a grand opportunity to investigate the question. Some of the best informed meat packers on the Coast will put themselves where the farmers may ask all the questions they wish. The killing demonstration and visits to the packing plants will be worth a trip from any part of California. The railroads will carry you home for one-third fare if you get a certificate for the purpose when you buy your ticket to Los Angeles, and have the certificate signed at the meeting by Secretary J. I. Thompson.

Hog raising and hog marketing are the topics. Blanchard's hall is the meeting place; Hollenbeck Hotel is headquarters.

Program.—Jan. 18, 9:30 a. m., Business session; 10:00, "The California Swine Breeders' Ass'n," C. B. Cunningham, Mills; 10:10, "The Swine Business," Hon. Jas. Mills, Hamilton City; 10:30, "Feeding

Growing and Market Hogs," Leon L. Lamson, Holtville; 11:00, "The Breeding Herd and the Pure-bred Business," Wm. Bernstein, Hanford; 11:20, Discussion: Feeding Problems, Self-Feeders, etc.; 1:30 p. m., "Why the Prices of Swine in California are lower than in Oregon or in the Middle States," F. L. Washburn of the Western Meat Co., San Francisco; 2:15, "Why strictly grain-fed, milk-fed, alfalfa-fed, and acorn-fed hogs all bring about the same price in California," Frank Hauser, of Hauser Packing Company; 3:00, "How to Market Hogs in California," Harris Weinstock, San Francisco; 3:35, "What is being done and what should be done for the good of the swine industry in California," D. O. Lively, San Francisco; 7:30, Theatre party. Jan. 19, 8:30 a. m., Killing demonstration at Cudahy Packing Co.; 10:00, Cutting display at Wilson & Co. packing house; 11:30, Inspection of plant, and luncheon at Hauser Packing Co.; 1:00 p. m., Visit to moving picture studios, and other points of interest in Los Angeles.

Raise the Heifer Calves.

[Written for Pacific Rural Press.]

While we are not writing to discourage those who anticipate better and broader markets through the establishment of milk condensaries, casein factories, and cheese factories, it is well that everyone who is to depend upon these market factors should keep well in mind the necessity of raising the heifer calf.

Experience has shown in the few instances where dairymen have sold their whole milk to these agencies in this State, that there is likelihood of losing sight of the importance of home-grown calves, depending instead on the purchase of cows in outside districts for replenishment of herds.

There are two main dangers in this practice: (1) It does not allow a constructive policy in breeding better animals by the use of pure-bred sires and the careful selection of heifers to be raised through a thorough personal knowledge of the dam and (2) purchased cows are more apt to bring disease into the

herd than are home-raised calves.

F. W. Andreason, Secretary of the State Dairy Bureau, says in his annual report: "The dairyman who sells or kills his heifer calves and buys cows to keep up or increase his herd, will usually find that some of the cows he bought were diseased and have spread this disease to a larger percent of his own herd, while the dairyman who raises his own stock is usually found to have cattle free from disease."

High feed and labor costs, together with more stringent dairy legislation concerning diseased dairy cows, has compelled older established dairymen who sell whole milk to revise the practice of breeding and raising their heifer calves, using in some instances 16 or 17 per cent of milk in the calf buckets, and in other instances whole-milk substitutes. With this experience before us we can not too strongly urge the raising of heifers by those dairymen who are soon to begin the selling of whole milk.

Satisfying Results With Alfalfa Silage.

[Written for Pacific Rural Press.]

While there are some dairymen who report poor success with first cutting alfalfa for silage, A. Haley of Newark, Alameda county, is a firm believer in it because of its saving value.

In other years Mr. Haley has cured the first cutting, but it has been so badly infested with bur clover, fox-tail, and other weeds, that its value as a feed for dairy cows was small.

Last spring he put all of this first cutting into one of his large concrete silos, running it through the cutter as it came from the field, but not adding any water.

Last summer he fed this silage, together with green alfalfa; and said that his production of milk was fully 10 per cent greater than the previous year when green alfalfa and mill feeds were being used.

But the increased value of the first cutting hay as well as the increased production of the herd are not the only advantages that Mr. Haley attributed to the silo. He also found that it enabled him to put up a very much greater amount of hay than before, because of the lessened amount of green alfalfa the cows consume when fed silage.

But alfalfa is not the only silage crop on this ranch, as it is the intention to fill the silos twice a year, the latter filling to be made with corn, thus enabling the feeding of silage eight months out of the year.

Unlike some alfalfa silage, that of Mr. Haley's was neither rank smelling or tasting, but is nice and sweet; which is most likely due to the fact that no water was added to make it slushy.

Hillcrest Stock Farm

Shorthorn Cattle, Shropshire and Merino Sheep

King Lancaster, sired by King Edward, grand champion bull State Fairs, 1909-10-11.

California Pasteurization Law Misquoted.

To the Editor: In a farm paper published in the East I found this item:

"A state-wide pasteurization law went into effect in California recently, but it has been found that the law must be administered with considerable judgment since both producer and consumer are still in need of education regarding this subject."

What does it mean? Is every farmer in California compelled by law to pasteurize his milk and make it unfit for human use? Isn't that pasteurization idea a cranky fad invented by job-hunting doctors eager to create positions for members of their profession unable to earn their living as doctors? I do not wonder that "the law must be administered with considerable care and judgment," for there must be men even in California who want to drink milk that has not been robbed of its power or life by boiling or half-boiling. If I lived in California I would try to be delivered from "education" whose purpose is to create artificiality. I hope that the wording of the above quoted farm paper is misleading; and that the inhabitants of California have a right to choose whether to drink their water cold or boiled, and their milk in its natural form or half cooked.

Ernest Skarstedt.

East Sound, Wash.

Read Western papers for reliable information regarding Western farming. We would rather drink our water boiled if it had typhoid germs in it; and if our milk contained tuberculosis (which is fully as common in States where cows cannot be outdoors the year around as they

are in California) we would like to be assured that "the bugs" would not hurt our baby. Our veterinary queries indicate many cases of open tuberculosis in cows' bags; our meat packers complain of the high percentage of condemned carcasses of hogs raised on skim milk because the Government inspectors find them tubercular; and we believe that the same is true elsewhere. In such a case, we would prefer the "life" taken out of our milk.

Our law does not make positions for doctors enough to shake a stick at; the only special "care and judgment" required in its administration are due to careless wording of the law itself; our producers need education toward the idea of reading Western farm papers to get the facts which have been published repeatedly in Pacific Rural Press.

Under the terms of the law Californians have the choice of drinking raw or pasteurized milk, but they have the privilege of knowing which it is. If they choose raw milk, they are reasonably sure that it does not contain tuberculosis; for no raw milk may be sold for direct consumption except from cows which have been tested free by the State Veterinarian or his deputies since Oct., 1916, when the law went into effect. Cows from which raw milk is sold must have been pronounced free from tuberculosis, etc.

Self-Feeding Hogs Without Waste.

[Written for Pacific Rural Press.]

One quite general complaint among hog growers who have used self-feeders is that the farm poultry take advantage of the open grain supply both for consumption and for scratching material, wasting in many instances more than they eat.

H. I. Marsh of Stanislaus county overcame this by erecting a feeder, wider than usual at the top with straight-sided bin part of the way down. At the joint where this straight side joined the inclined bottom of the feed container a set of hinged doors, made of rough lumber, were hung so that they would swing in from the top. By this arrangement the doors hang straight down when the hogs are not feeding, thus keeping out all kinds of fowl which are not strong enough to push the doors in. On the other

hand these doors are easily pushed back by the hogs when feeding, being held up by the back of their heads and swinging back in place when the hog leaves the trough.

The feeder is made large enough so that it may be placed on a division line between two pens, each side being alike in construction. There are four divisions in the feeder with a capacity of holding 200 pounds of tankage, 200 pounds alfalfa meal, 400 pounds rice middlings and 400 pounds rolled barley. Regulation of feed is done by board gates which fit into the feed slots and extend to the top of the bins. An improvement suggested by Mr. Marsh is to equip these gates with springs, so that they will fall back in place automatically agitating the feed by the hogs' rooting.

Hog Prices Lower Here---Why?

To the Editor: I am entirely familiar with practically all the conditions under which hogs are fed and marketed in California. I also know that the prices are not what they should be for certain classes of the raw product, and that the discrimination by packers against the home product does the hog-raising industry of the state great injury. For example: Paying 9 cts. a pound for some of the purebred stock which was exhibited at Sacramento, when the price for properly fed stock in Chicago was on the same date nearly three cents higher. This is information which I have obtained from the columns of the Rural Press.

I will tell you exactly what I believe is the trouble in California with the market prices of some of their products which are marketed locally. They need federal super-

vision. It is all right to exclude diseased hogs, and the government will see to that. It is also all right to make the price for a tute hog which has not been either properly bred or fed, proportionately low; but when they will pay a lower price for animals that are properly bred and fed than they do in Chicago or Omaha or anywhere else, and still have the retail product as high or higher than ever, they need regulation.

Tucson, Ariz. Mark A. Rodgers.

We suggest that you attend the meeting of the California Swine Breeders' Ass'n at Los Angeles Jan. 18 and 19. Several of the leading packers of the State are on the program and will be graceful targets for all such questions. Go to it while you have a chance.

TREWHITT'S BIG TYPE POLAND CHINAS

The blood lines of the herd are unexcelled, the foundation stock having been secured from the Topnotch Herds of the Middle West. Sows of fine quality, yet big and roomy. The sort that have large litters of vigorous pigs.

Offering for sale a choice selection of gilts, boars and bred sows.

W. D. TREWHITT,

HANFORD, CAL.

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW.
P. P. I. E. 1915; Sacramento 1916.

For many years, at widely separated how rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large, and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished. Young stock, \$30 Up.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

THE DAIRY.

C. H. Gillespi and D. S. Wall of Los Angeles have recently purchased 100 acres of land near Orland where they will establish three dairies.

During the past month the Hutton certified milk dairy at Dixon has suspended operations and the cows sold to the Timm Dairy at that place. Mr. Hutton has been in the milk business a number of years.

Wing and Wing, proprietors of the Golden State Dairy Farms at Dixon, are now shipping about 500 gallons of milk a day to Oakland from their combined dairy and pasteurizing plant at Dixon.

D. M. Campbell is starting a cheese factory at his ranch north of Dixon and during the next month expects to enlarge his plant to a capacity of 5000 pounds of milk daily. Dairymen in that section are disgruntled at the treatment accorded them by San Francisco milk dealers.

Owen Duffy, business manager of the Napa State Hospital, advises us that he is endeavoring to have the members of the California Holstein Breeders' Ass'n hold a spring meeting at the Napa State Dairy. The model barns and good cattle will doubtless appeal to the association's members.

W. L. Bowron has just completed a new dairy barn, 128 feet long and 34 feet wide, on his place in Stanislaus county. The barn will accommodate 60 cows, has concrete floors and is equipped with milking machines. Mr. Bowron expects to engage in the dairy business on a large scale.

Charles H. Holmes, of Los Angeles, who owns a ranch five miles east and one mile north of Tulare, has just shipped a fine Holstein bull to Tulare. The bull is a son of Prince Ruda Korndyke, and his dam is from a brother of Aralia De Kol, world's record cow, who produced over 1100 pounds of butter in one year.

*Word was received last week from the East by Clifford F. Reid of Oregon that his Jersey cow Goldie's Nehalem Beauty had broken the world's butterfat record by producing an average of two and a half pounds of fat a day for an entire year. The record was previously held by Lass 74th of Hood Farm.

Although January 1 was the day set for the new Cream Pooling Association in Madera county to have commenced operations a report from Chowchilla states that many dairymen in that district were doubtful of the ability of the successful bidders to pay the proposed price and did not, therefore, change creameries.

At a meeting of milk producers held at Stockton last week at which State Market Director Weinstock was present a movement was started to get reliable information as to the cost of producing milk in that district. One dairyman present stated that he had kept accurate account of his business and found that it costs him 13 1/2 cents to produce a gallon of milk.

In order to more fully acquaint dairymen and breeders with the California Cow-Testing Competition Prof. F. W. Woll of the University of California addressed members of the Humboldt County Dairymen's Ass'n at Ferndale Jan. 10 and members of the Ferndale Cow Testing

Ass'n on Jan. 11. He will also address members of the California Milk Producers' Ass'n at Los Angeles Jan. 17.

Two of the high records recently made by Holsteins at the Stanford University's ranch at Vina, Tehama county, are 468.6 pounds of milk containing 31.92 pounds of butter, produced in seven days by Boweda, a six-year-old cow, and 491.8 pounds milk containing 26.09 pounds butter by the six-year-old cow Dormoon. Both of these cows were sired by Sir Dorinda Jewel and both are entered in the California State Dairy Cow Competition. The work of improving small dairy units on this great ranch to lease to dairymen is progressing satisfactorily.

SWINE AND SWINEMEN.

E. B. McFarland of San Mateo county has recently purchased five sow pigs, granddaughters of Laurel Champion, from Frank Steel of Grants Pass, Oregon.

Dr. T. B. Spaulding, veteran Poland China breeder of Turlock, advises us that he has recently sold six Poland China pigs to the Houston Pig Club members, five splendid gilts to Mr. Anderson of Denair, a fine boar to Ralph Scott of Selma and an elegant yearling boar to E. P. Campbell of Atwater.

At a hog raisers' meeting held at Hanford last week Dr. B. J. Cady warned farmers against indiscriminate buying of hogs because of the danger of hog cholera involved. He believes that growers must cooperate if they would lessen the loss from this disease and recommended the more general use of hog cholera virus and serum.

J. M. DeVilbiss, breeder of purebred Duroc Jersey swine at Patterson, Cal., after a few much-appreciated words in commendation of the Pacific Rural Press as a journal of rural information and also as an advertising medium, says: "When I came from the corn belt I had no idea of starting a purebred herd on the Coast, but, having handled purebred hogs for over thirty years, it has become a habit. I believe the prospects for the breeder are very bright, and I have in the last twelve months added a thousand dollars' worth of new blood to my herd."

Geo. M. York and Son of Modesto announce a dispersion sale of their purebred herd of Berkshires at Modesto, January 20. In establishing this herd Messrs. York took great pains to secure highly bred foundation animals, securing as herd headers the boars Premier Leader, a son of Grand Leader that was awarded grand championship honors at the Stanislaus County Fair last year, also Loyal Duke 6th, a boar that was second in the senior yearling class at the 1916 State Fair. There will also be a number of aged sows and bred gilts in the consignment.

To further strengthen his already strong herd of Berkshires, Arlington Smith of Visalia has recently purchased from Winona Ranch, Grants Pass, Ore., a young breeder's show herd that Mr. Steel had contemplated showing himself next year. The three gilts of this lot are daughters of Laurel Champion and out of Princess Royal, making them full sisters of the Smith boar Winona Royal Champion 5th. The boar to head this herd is a son of Big Four and out of Silbirta Duchess 15th. Mr. Smith also purchased at the same time a daughter of Laurel Champion out of an English bred sow and will accordingly have a strong show herd in all classes at the coming year's fairs.

HENDERSON CO. MAKING RECORDS.

The following seven-day records have recently been made at the Hen-

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2 1/2c per word.

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to order. First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

TURLOCK PARK RANCH, Turlock, Cal.—Registered—Biggest Type, Big-boned breed of Poland Chinas. The prettiest, the most prolific and the easiest fattened—the biggest and most profitable hog on earth. Sows weighing six and eight hundred pounds, with coats like silk and with showing quality. Open and bred sows and massive young boars for sale from a line of 1000 pound boars—the largest and best blood-lines of the breed. Nothing but tops tolerated or sold from my ranch. Inquiries and visitors cordially welcomed. Dr. T. B. Spaulding, Importer and Breeder of the World's best hogs.

MAKE BIG MONEY with our Big-type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months. 300 head, both sexes, all ages, reasonable prices. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare county, but address owner, E. H. Whitten, 610-A Security Building, Los Angeles.

GRAND CHAMPION SUPERBA POLANDS—A few choice spring Superba boars ready for service. Sows bred to Superba for fall litters. Prices reasonably low. Rough's Greenfields, Arlington Station, Riverside, Cal.

FOR QUICK SALE—Registered Poland-Chinas. 15 boars four to six months old, \$20 each. 10 gilts same age, \$15 each. Registration free. Stock first class. C. L. Vanschoeck & Sons, Chico, Cal.

REGISTERED IMPORTED PERCHERON Stallion for sale cheap. Hewitt & Hewitt, Dixon, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT CO., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dunn or Bradstreet, or San Francisco banks. Office 319 Underwood Building, 525 Market St., San Francisco.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

the first importation into that orange kingdom of this particular breed of stock and the future rival of old King Citrus.

The shipment was selected by a representative of the Riverside Jersey Breeders' Association, together with J. M. Roberts, Field Agent in California for the American Jersey Cattle Club, after a diligent search lasting six weeks, in the East and Middle West. Twenty-one head were included in the shipment, and all are representative of the foremost Jersey families.

The Riverside Jersey Breeders' Association recently started a campaign to advance the interests of purebred livestock in this fruit community, and having backed this trip they are now ready to go ahead at a rapid clip to help diversify the resources of Riverside county and advocate better and more purebred livestock.

COW-TESTING RECORDS.

The following are the names and records of the cows in the Gridley Cow-Testing Association which have produced more than 40 pounds of butterfat during the period of 30 days ending Dec. 31st, 1916:

S. A. Mealey, Gridley, Holstein, 55; J. H. Guill, Chico, Holstein, 49.9; H. F. Harrger, Gridley, Durham, 46.2; L. Hess, Tudor, Holstein, 45.1; H. E. Wickman, Gridley, Durham, 44; H. E. Wickman, Gridley, Holstein, 40.3; Cronby & Keifer, Gridley, Holstein, 43.3; Cronby & Keifer, Gridley, Holstein, 42; Freisleben Estate Co., Durham, 43.1; R. E. Fields, Biggs, Holstein, 42; R. E. Fields, Durham, 42; R. E. Fields, Durham, 41; R. E. Fields, Durham, 40.7.

U. OF C. SELLS BERKSHIRE FOR \$1500.

What is the highest known price ever paid for a purebred hog in California was the \$1500 paid the University of California for the Berkshire boar Star Leader by Mark Regua of Orland during the past month.

This boar was purchased by Prof. J. I. Thompson from A. B. Humphrey at the P. P. I. E. before judging, and is conceded to be the best son of Grand Leader ever exhibited. He has been used at the University Farm to head the Berkshire herd there. We understand Eastern breeders were also endeavoring to purchase him at the time the deal with Mr. Regua was made.

SOUTHERN DUROC BREEDERS TO MEET.

The Southern California Duroc Jersey Association will hold a regular meeting on Jan. 18, 1917, the exact hour and place to be announced by one of the speakers of the California Swine Breeders' Association on that day, at Blanchard hall. All people interested in Durocs in Southern California should attend this, and any desiring membership should send their names to R. K. Walker, Devore, Cal., enclosing one dollar for one year's membership.

NEW STATE HORTICULTURAL COMMISSION SECRETARY.

Announcement is made that G. H. Hecke, State Horticultural Commissioner, has appointed Harry Maddox, former secretary of the Yolo County Board of Trade, as Secretary of the State Horticultural Commission. Mr. Maddox has been more or less familiar with the horticultural problems of the State through his association with Mr. Hecke, while the latter was horticultural commissioner of Yolo county.

HOLSTEIN BREEDERS TO RE-ORGANIZE.

As a result of the meeting of the California Holstein Breeders' Association at Sacramento last week, Fred W. Kiesel of Sacramento was elected president and Kenneth Abbott of Milpitas, secretary-treasurer. It is the intention to revise the by-laws and constitution of the association and make the association an active medium in the work of breed promotion in the State.

Gertie's Son, Victor, No. 123159. Dam, Victor Lady Lake (R. O. M.) of 536 pounds butter in 303 days as a 4-year old.

Invest In JERSEYS and Start Right

135 Registered Jerseys in my herd, including 18 Register of Merit Cows. Blue-ribbon winners at 1916 Hanford, Bakersfield, and Visalia Fairs.

Correspondence solicited.

A. A. JENKINS
TULARE, CALIF.

Testing your cows tells whether they are earning money for you. By the Register of Merit work you can now build up your herd from animals of known production. Science is driving guesswork out of the dairy business. Government records show that the average net profit per cow was increased 129% in eight years by testing. Selection based upon actual dairy merit will produce like results in your herd. Our booklet, "What is Accomplished by Testing Cows," will help you. Send for now. It's free.

"Good to the Last Drop"

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or

Coulson Poultry & Stock Food Co., Inc., Petaluma.

BAKER'S TRACELESS HARNESS

Best plow rig. No WHIFFLETREES—NO TRACES. Hand st farm harness.

Indispensable in the orchard with special fitness for all low down work. You can hitch closer to your load, plow and cultivate close to the row and save all the worry to man and team. No weight of whiffletrees for man to lug. Everything clear behind team. Use our outfit and save your trees. Highest endorsement of farmers and fruit growers.

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]
[Subscribers wishing an immediate reply should send money order for \$1.00.
No charge for questions answered through this department. Name and address of
subscriber must accompany each query.]

HORSE ALMOST PARALYZED.

To the Editor: I purchased a 5-year mare from a grain rancher in the foothills a year ago. She seemed in perfect health. After bringing her to the valley and feeding her alfalfa from December to April, she would seem stiff in the hind quarters when hitched up after being idle 24 to 48 hours, and if driven any distance will get almost paralyzed, sweating profusely. I have changed her feed from alfalfa to alfalfa and grain hay, being careful to feed lightly when not at work. Is it azoturia?—J. R. W., Modesto.

Light feeding when not exercising is the prevention of azoturia and the only one.

BULL LAME AFTER SERVICE.

To the Editor: Two weeks ago a six-year dairy bull covered a cow twice and I left her with him. About 20 minutes later I noticed that the bull was quite lame in his hind foot or leg. He does not bear any weight on the leg. I can't see any swelling, but he doesn't like to have it touched.—W. J. P., Pixley.

Your bull injured himself while serving this cow. If you can locate the seat of lameness apply a good liniment to it twice a day.

SWELLING ON HOCK.

To the Editor: A 7-months colt has a swelling on the hock joint inside and outside. I used a bottle of Absorbine, but it is still a soft puff.—H. S., Plymouth.

Rub tincture of iodine over the swelling daily. You will have to carry the treatment over a period of several weeks.

CHICKEN POX VACCINE AND DISINFECTANT FOR DRINKING WATER.

To the Editor: What is the latest and best way to doctor for canker and chicken pox, and the best thing

to use for disinfecting and to put into drinking troughs?—C. E. H., Modesto.

Vaccination is very successful for chicken pox and canker. The writer prepares this vaccine which sells for 2½ per chicken. Sulphocarbolates is the best internal antiseptic to use in the drinking water.

BLOODY MILK AGAIN.

To the Editor: One of our heifers gives bloody milk from two hind teats. For six or eight weeks after calving she was all right.—B. B. Pacheco.

Many remedies have already been given for bloody milk. See the indexes in last issues of June and December.

PONY'S LEGS STIFF.

To the Editor: Our pony has got so stiff in the shoulders and forelegs that she can hardly move about. We think it water founder.—V. S., San Jose.

Give this animal alum in ounce doses four times a day for two days.

CALVES DIZZY.

To the Editor: From one feeding to another, my calves start walking around dizzy, and drink milk but very little; scour very little. Were doing fine before they sickened. Fed separator milk.—E. R. B., Cayucos.

Additional symptoms will be necessary for diagnosis.

SORE ON BAG.

To the Editor: Our 5-year cow came fresh 5 weeks ago: has a two-inch sore spot on front part of udder just where it joins the belly. I scraped the scabs off to syringe it out with diluted creolin and found it very offensive and mattery. Have been syringing every day, but it doesn't heal at all.—C. E. H., Modesto.

Swab this sore with tincture iodine daily.

Wormy Horses Eat, but do Not Thrive.

Many horses lose condition, or fail to make gains during winter months, because they are infected with worms. This is especially true of colts. Horses suffering from worms generally have a good appetite, but apparently benefit little from the food eaten.

There may be no symptoms which point conclusively to worms, but this

trouble is so common that if the colts and horses are not doing as well as they should for the feed given, a worm remedy may prove of decided value. In treating horses for worms, Dr. L. S. Backus, of the Missouri College of Agriculture, suggests, it is well to keep in mind that the drug is meant for the worm rather than the horse and should therefore be given in as concentrated form as possible. To insure this, little or no bulky food should be fed during the course of treatment, and as the parasites are stupefied by worm remedies rather than killed, the animals bowels should be kept in an active condition so that the stupefied worms may be passed out before they regain their vitality. A well-salted bran mash once a day will generally insure such an action.

The following formula is a worm remedy which is also of value as a tonic: Powdered nux vomica 2 ounces; powdered gentian root 4 ounces; powdered areca nut 6 ounces; sodium chloride 4 ounces; arsenious acid 2 drams. Mix.

Give one heaping teaspoonful to every 250 lbs. weight, every morning and evening for about ten days. The medicine may be mixed with ground feed or sprinkled over oats or corn which has been dampened.

Raising Poultry for Profit

STARTING THE INCUBATOR.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

The first thing to do in starting an incubator is to clean everything up well with good hot water and sal soda. Start the lamp after boiling the burners in the same kind of water, putting in a new wick, and if they are on hand, put in two thermometers, so as to guard against mistakes. It will require more heat to keep your incubator going in winter than in summer, so turn up the wick fairly high. To be safe in turning the wick up you must know the kind of oil you are using, as a poor grade of oil is more or less sooty and will be sure to cause trouble. Few incubators have draft enough to consume poor oil without making soot which gathers in the air passage, sometimes putting the lamp out and filling the egg chamber full of smoke. When this occurs, always investigate the oil and change for a better grade as soon as possible.

It sometimes happens that the lamp takes fire when a poor grade of oil is being used, and this usually happens without a bit of warning, at least that is what the operator thinks, but it is simply that he has not understood the warning or not noticed it. When the operator happens to be a woman that is new to the work, she gets scared when the room fills up with smoke. Of course it is time to get in action, but not scared action. Keep cool and grab a gunny sack to handle the lamp with, getting it off the board as quickly as possible, then just wrap the gunny sack around the lamp and the light will be smothered at once.

Never put the lamp on again when this happens, until every vestige of soot has been cleaned out of the pipes and tubes leading to the egg chamber. If the temperature has run up, open the doors and take out the eggs; but if it happens that the egg chamber is too cool, use some means of increasing the heat such as hot water put under the eggs or a hot flat iron, just to keep things going until you can thoroughly clean out all soot, and wash your lamp. Put in a new wick and fresh oil, but, whatever else you do, be sure to make everything clean and free from soot, or you will have the work to do over again and perhaps lose your eggs and courage.

People who write poultry topics do not often touch on these things, for one thing they have gotten away from them with practice themselves, and again, they like to pose as never having had such "terrible experiences"; but we have all had these troubles, and it was not always our fault, nor is it always your fault, because you may pay a good price for oil and yet it may not be good quality, and I don't know of any sure way of testing oil without using it in an incubator. That is a certain test of quality, for if it burns clear without soot or sparks it is all right. When the thermometer registers 100 degrees, watch it closely, note how long it takes to gain the last three degrees and then commence to regulate it. When it runs evenly at 102½ for three or four hours with-

out changing, it is safe to consign the eggs to it, and if possible this should be done early in the morning so that there will be time to warm them before night. If the machine has been properly regulated before putting the eggs in, it will not need much regulating for several days; but it is always best to keep close tab on it. There is no such thing as "luck," in running an incubator; it is simply paying attention to details and being faithful and regular in doing what is to be done.

For instance if your lamp is filled at four o'clock today and five o'clock the next day and somebody calls your attention away the next day at five o'clock, then you begin to think of supper; and filling incubator lamps does not jibe with supper conditions at all, so it clear escapes your memory until bedtime. You may think, if the lamp is still going, that this is "luck," but it is not. It may be nice weather and the incubator is not consuming as much oil as usual, so just congratulate yourself and be more careful in future. Personally I like to fill lamps in a morning, but if the weather is very cold, unless the lamp is large, I always put in a little more oil to make sure at egg turning time in the afternoon. This lets me sleep easier because then I feel sure all will be well until morning. Running incubators under changing weather conditions is hard on the nerves, at least it is on me, and there are very few incubator houses weather-proof in California.

Always turn the eggs before filling the lamps, then there will be no oil on your fingers to hurt the eggs. Always do both chores at the same time each day, making as equal a division in time as possible. This means if you do not turn the eggs and air them until eight o'clock in the morning don't hurry to turn them in the afternoon but give them all the time you can compatible with your other work. Running an incubator is simple and easy, but it does require a certain amount of judgment and a great amount of common sense in following directions and keeping track of time.

I never turn the eggs at first until forty-eight hours have passed, then take out one tray at a time, turn the eggs swiftly but gently and put pack at once. At this stage the germs are barely started; and if the eggs receive a jar or jolt the germ is injured if not killed outright, so we handle very carefully until after the ninth day when they will stand considerable rough handling, in fact it seems to do them good.

The danger zone is from the first to the fifth day, if eggs are either chilled, over-heated or jolted during that period they will not hatch so well nor will the chicks be so strong if they do hatch. After the fifth day the eggs should be turned twice a day; but not until the ninth day will it be necessary to air them over a few minutes during cold weather. When the warm days of summer comes they can be aired from the fourth day to good advantage.

After the tenth day let the thermometer creep up to 103, but not

over that because if you do you will have to give them more heat in brooding. Don't forget that when the incubator is run high, the chicks always need a higher temperature to brood them; and if they don't get it they suffer from chills and diarrhea. I think it would pay hatchery men to warn customers to brood extra warm in such cases, but nine out of every ten, chick buyers have no proper brooding devices, and the chicks get chilled and die, when they could be raised by better and warmer brooding.

Hens Stop Laying.—Will feeding hens moldy Egyptian corn and letting them out early on frosty mornings stop them from laying?—G. L. J.

Feeding moldy grain of any kind is injurious to all poultry, because it causes disease of the lungs and intestines, but whether it would stop them laying, suddenly, I do not know. But letting them out on frosty ground may stop them as sudden as a gun. Keep them in until the ground warms up and furnish them something to scratch in to start up circulation.

Six thousand turkeys were shipped from Tulare for Christmas consumption. The value of the shipments was placed at \$18,000.

California Poultry Practice

A Practical Treatise on Poultry Raising in California

By Mrs. Susan Swaysgood

Writer and Breeder

Of Utility Poultry.

160 pages of text, besides many full-page illustrations. Cloth bound.

This Book Will Help You in the Many Details of POULTRY RAISING.

In writing this book, the author, after a lifetime of active, practical and successful experience in poultry raising on the Pacific Coast, has endeavored to show the farmer how he can make the poultry department of his business more profitable. It deals with actual conditions—not theories—and covers every phase of the industry from eggs, chicks, disease and remedies to the profitable marketing of the products of the poultry farm.

Poultry Breeders' Directory.

OUR BABY CHICKS are hatching every week now. Have you ordered yours? You know what you want and we think we can fill the bill—high quality, reasonable price, and prompt service. Won't you write us for prices and circular describing our R. I. Reds, Barred Rocks, Black Minorcas, White and Brown Leghorns. We want your business and future good will—it takes a fair play deal to get that. Our hatchery is up to date and we reckon to know our business. Let's get acquainted. A postcard will introduce us. Roofed Poultry Ranch & Hatchery, Campbell.

EXTRA QUALITY White Leghorn chicks, 13¢ until March 1st, then 15¢. Carefully bred from MacFarlane, Young, Martin, and Cyphers strains of foundation stock. Eggs, \$1.50 per 15, \$2.50 per 30, \$5.00 per 100, \$50.00 per 1000. Acres of free range connected with our breeding pens, 20,000 feet under roof. Only Jubilee incubators used; despatched every hatch. Don't save 2¢ per chick in buying, and lose a dollar per pullet in raising; get the best and succeed. Newton Poultry Farm, Dept. 1, Los Gatos, Cal. Catalogue free.

THE J. K. BIGELOW POULTRY RANCH and Hatchery—300 acres devoted to superb vigorous Hoganized White Leghorns. Bigelow chicks are incomparably superior to the product of ordinary commercial hatcheries. Prices same as former seasons—10 cents each till April 1, 9 cents during April and May, and 8 cents thereafter. 10% deposit required with order. The Bigelow Poultry Ranch, Sonoma, Cal.

BARRED PLYMOUTH ROCKS—COCKERELS—Cockerels—Yes, we have them; also Hens and Pullets—all bred from our Champion Winners at California's leading shows. Also hatching eggs. If it's Barred Rocks you want, get in touch with me right away. Have bred them exclusively for nineteen years. Send for Catalog. Chas. H. Volden, Box 394, Los Gatos, Calif.

"FINEST HATCHERY IN THE WORLD"—Baby Chicks, White Leghorns, and Rhode Island Reds, settings, 100's, 1000's, hatched right in our \$60,000.00 brick and concrete hatchery from our quality heavy layers. Reasonable prices. Stock, Hatching Eggs, Poultry Farm and Hatchery, Sunnyvale, California.

WHITE PLYMOUTH ROCK, White Leghorn Incubator Chicks. Breeding stock. Eggs high class. Scientifically bred. Awarded all first prizes. California State Fair 1916. Make your arrangements for 1917 delivery of chicks. Mahajo Farm, P. O. Box 597, Sacramento, Cal.

WANTED—A number of hot water incubators, Jubilee preferred, 200 egg capacity or over. 220-egg type, Hoganized, S. C. White Orpingtons and Sicilian Buttercups, cockerels, hatching eggs and chicks. All information gladly furnished. M. E. Woodhams, San Mateo, Cal.

BABY CHICKS—From large, healthy, vigorous, heavy laying thoroughbred Single-Comb White Leghorns. \$10 per 100; \$2 per 100 when order is booked, and balance 5 days before delivery. I pay the express to your nearest express office. H. A. Schlotthauer, Exeter, Cal.

BABY CHICKS—Get some of our good strong youngsters but order as far ahead as possible. Hatches every week. R. I. Reds, Barred Rocks, Black Minorcas, White and Brown Leghorns. Write for circular. Campbell Poultry Ranch, Campbell, Cal.

WHITE LEGHORN AND BROWN LEGHORN day-old chicks from healthy, vigorous breeders. "Chicks well hatched are half-raised." Will be pleased to send you our circular. San Jose Hatchery, 373 Meridian Road, San Jose, Cal.

S. C. WHITE LEGHORNS (Martin Strain)—Exhibition and utility combined. Hatching eggs, \$1.50 and up to 15¢; \$6 per 100. Pons headed by prize winners. Cockerels, \$5 each. Chas. H. Myers, Hayward, Cal.

THOROUGHLY BRED S. C. W. Leghorns—Cockerels, \$2.50 each, from strong vigorous hens, typed to lay 200 to 260 eggs per year each. Also booking orders for baby chicks. Jay Maxwell, Madera, Cal.

HATCHING EGGS from our "Bred-to-Lay" S. C. White Leghorns. Season opens Dec. 1st. The early hatch lays the early winter egg. Booking now. R. H. Dickinson, Dept. IV, Los Gatos, Cal.

THE SANTA CLARA VALLEY HATCHERY solicits your orders for Fall and Spring delivery in 8 breeds of baby chicks. Order early and get the best. Jos. A. Bihn, Lincoln Ave., San Jose, Cal.

RHODE ISLAND REDS—Cocks, Cockerels, Pullets, Hatching Eggs. Blue Ribbon winners at last Oakland Show. Wm. Larm, 3915 39th Ave, Fruitvale, Cal.

JUBILEE HATCHERY, Petaluma, Cal.—White Leghorn and Black Minorca chicks and hatching eggs. Circular "How to Raise and Feed Chicks" free.

S. C. RHODE ISLAND REDS—Pullets and Cockerels. One Black Orpington Cuck Eggs from R. I. Reds and Silver Campines. Mrs. R. S. Sweeney, Woodland, Cal.

INCUBATORS—For Essex Model Incubators at factory prices, write Geo. H. Croley Co., Inc., Poultry Supplies, 631-637 Brannan St., San Francisco.

BABY CHICKS (White Leghorns)—shipped on approval before receiving. No weak ones changed for. Schellville Hatchery, R. F. D., Sonoma, Cal.

WHITE LEGHORN BABY CHICKS from selected best laying stock. Only strong, healthy chicks sent. Mrs. G. Logan, Morgan Hill, Cal.

DAY-OLD CHICKS—These chicks are hatched from our own flock of 8,000 Utility White Leghorn Hens. George Bros., Petaluma, Cal.

BARRED ROCKS—Grand lot of high-class breeding males and females for sale. Satisfaction guaranteed. G. E. Tobin, St. Helena, Cal.

WHITE WYANDOTTES—Blue-ribbon winners. Eggs \$2 to \$5. Chicks pullets, cockerels. R. W. Staweski, Route 2, San Jose, Cal.

HATCHED CHICKS from Barred Rocks, R. I. Reds, White Leghorns. Good stock. Send for circular. G. L. Hawley, Madera, Cal.

EASTMAN'S REED TO LAY Barred Plymouth Rocks, Chicks, Eggs, Cockerels. Fairmead Poultry Farm, Fairmead, Cal.

LOS ANGELES POULTRY SHOW.

[Written for Pacific Rural Press.]

The twelfth annual meeting of the Southern California Poultry and Pet Stock Show was held in Los Angeles January 3 to 9 and was one of its biggest and best. There were 1580 entries in the poultry department, 350 pigeons, and 200 rabbits. Every variety of fowls were represented and there were many beautiful birds. The feature of the show was the Black Minorcas. For the first time the America Black Minorca Club exhibited in competition in California. The entries of these great layers and beautiful fowls reached 190. Among the exhibitors were Goodacre Brothers of Compton with fifty birds. District Attorney McCartney had fifty birds. J. J. Graves of Redwood City showed 30 Buff and Black Orpingtons and a number of Rhode Island Reds. R. A. Rowan of Los Angeles had many entries, showing Spanish Silver Spangled Hamburgs and ornamental bantams. The bantam exhibits were very numerous and very pretty. Turkeys were well represented, the bronze, white and red all being on hand, and there were some very handsome birds among the entries. Pekin, Indian Runner and Rouen ducks were on hand in good numbers and attracted much favorable comment.

The following gives the number of the different varieties of chickens shown: Plymouth Rocks 235; Wyandottes 77; Rhode Island Reds 221; Rhode Island Whites 5; Light Brahmas 51; Partridge Cochins 5; Lanshans 14; Leghorns 110; Minorcas 203; Black Spanish 11; Andalusians 14; Golden Sierras 4; Orpingtons 166; Sussex 26; Cornish 55; Hamburgs 13; Lakenfelder 1; Pit Games 6; Buttercups 10; Houdan 1; Missouri White Fluffs 5; Guinea 1; Bantams 110; turkeys 34; ducks 27; and geese 2.

Mrs. H. L. Barnes of Artesia entered a seven-pound, two-year-old capon which has successfully acted the role of mother to twelve broods of chickens. Another feature of the display was a big cage of silver and golden pheasants with their gorgeous plumage.

The pigeon exhibit was a big one and contained many pretty and interesting birds. For the first time the rabbit fanciers of Southern California joined in conducting a show. There were 210 entries and some

BRONZE TURKEYS—Young stock of both sexes. Large and vigorous. Eggs in season. Order early. Free circular on turkeys, feed, etc. Albert M. Hart, Clements, Cal.

WHITE HOLLANDS EXCLUSIVELY—Only high-class birds from prize-winning stock for sale. Rockwood Farm, 201, Route 6, Santa Rosa, Cal.

MAMMOTH BRONZE TURKEYS and Eggs. Booking egg orders now for early Spring delivery. M. M. delman, Planada, Cal.

very beautiful bunnies. There were 67 Flemish giants alone. The Los Angeles Fur Farm showed a number of rabbits raised for their fur. They had long hair and were very beautiful. Included in the exhibits were English Long Hair; English Long Ear; German Checked; Giants; Dutch Imperials; Kai-Gais, Himalayas, and Angoras. Farming rabbits for their fur is said to be very profitable, as high as \$2.00 to \$5.00 being paid for pelts.

The reports of the 54 associated cold storage warehouses of December 1 showed only 1,336,000 cases of eggs on hand against 2,040,000 cases the same date last year, a falling off of 704,000 cases compared with a year ago. There were loaded out of the warehouses during the month of November 881,000 cases against 1,058,000 cases to November of last year. The high prices this year have much to do with the lighter movement of eggs into consumption this year than last. The very light stocks, however, make the market situation a strong one, and the storage supply will doubtless be exhausted early in the new year.

Temporary organization of the Poultry Producers' Association of Southern California, Inc., under the new Weinstock marketing plan has been effected. In the temporary organization the directors of the old federation were elected as temporary directors.

Mrs. Best's Letter.

My dear Friends: I wish I could take all of you through the stores with me this week that you could profit by the great reduction in many staple articles.

Sweaters have grown to be such a necessary article for all women, that it is no wonder there are all colors, different weaves and all sizes to be seen in any first-class shop.

The Angora sweater rather leads in popularity, but it is inclined to grow rough and then wear off so that the closely woven wool sweater really is the best buy. It holds its shape, is warm and unless it fades is a permanent investment. Most of these come in brilliant colors, purple, yellow, green, deep rose and bright blue, and many of them have either white angora collar and cuffs or gaily striped ones of contrasting colors. These collars and cuffs are sewed on and could be added to an old sweater one wished to freshen up a bit.

There are still shown the woven Jersey cloth sweaters, many of them in striped materials and they are also warm. One of the very new garments, that is called an auto coat, is of Jersey cloth coming clear below the knees and trimmed in fur. This would be toasty warm worn under a loose coat of any sort.

The fibre silk sweater is very much reduced in price and they are being shown in beautiful colorings, but I think when spring comes, we no doubt will see them much worn again. They may be longer and probably will have collars instead of the plain neck. The thin handmade Shetland floss sweaters are popular and are made quite long in soft shades of rose or in white. I know young ladies who have made them at home and there must surely be a large saving in so doing, for they are \$15 in the stores. They are very stretchy, however, and are not of much use for warmth.

Blouses of the same color as one's suit are better style this winter than the all white—they are all of them V-necked with some style of collar, either of the same shade or of a contrasting color. One of the very newest ideas is a pleated collar and cuffs—the collar extending on downward in revers. This collar comes up well on the back of the neck, a style that is becoming to most women. The beaded effects are still popular and can be added to a plain blouse if one has the ability to follow a design.

The generous use of beads on the ready-made blouses adds anywhere from \$5 to \$10 to their price. Sleeves continue to be long and almost always finished by a cuff or soft frill.

Rosabella Best.

MEASUREMENTS.

One pint of liquid equals one pound, two gills of liquid make one cupful, four teaspoonfuls make one tablespoonful, two round tablespoonfuls of flour will weigh an ounce, half a pound of butter will make one cup, four cups of flour make one pound, two cups of granulated sugar make one pound, but in powdered sugar it takes two and one-half cups to make one pound.

THE HOME CIRCLE

THE PLAY HOUSE.

By Olive Day Thacher.

"Rob, come here, please," called Margery Hilton to her brother while they were playing in the barranca one December afternoon. She pointed out an oak tree with a trunk hollow at the bottom, although the tree was still alive and flourishing.

"Well, what about it?" asked Rob, who had been interrupted in the interesting task of looking for wild walnuts.

"Couldn't we make a play-house in there? See that hole near the top of the hollow part. It would make a good window. We could have a gravel floor and make some furniture and have a garden outside."

Rob studied the interior thoughtfully for a few minutes. He was clever at making doll furniture and this kind of play-house seemed more interesting than one built of boards. He and Margery laid their plans and proceeded to carry them out like thorough workmen. Soon the window was curtained and there was a screen behind the larger opening which served as a doorway. The play-house had a smooth gravel floor and contained a table, two chairs and a diminutive hammock. The children also tried their hands at making pottery of a pink substance like clay which had been washed into the barranca from a well.

Beatrice Hilton came home from college for her vacation and Margery asked her if she could crochet a rug for the play-house. "I think I could if I tried very hard," answered the obliging big sister. "What size and colors do you desire, Madam?" A heavy dark-green worsted was chosen for the rug and it was made round. Then Margery's favorite doll held a house-warming celebration. Grace and Jack Burnett, special friends of Margery and Rob, were the guests and Beatrice took down a large pitcher of lemonade and a plate of cookies. She always had to take up the rolling pin the first thing when she came home, for her small sister and brother insisted that no one else could make cookies as good as hers.

Not only the doll used the house, for Topsy, Margery's kitten, liked to curl up on the rug and go to sleep on warm days. The garden claimed

the children's attention next. They brought ferns and wild flowers and planted them near the tree and trained a wild pea vine to grow over the trunk, but a stem of poison-oak that started to climb up was ruthlessly discouraged. Beatrice was studying Botany at college and she told the children interesting things about the ferns and mosses and the lichens that grew on the tree. The season was early even for Southern California, and it was an ideal time to study plants. Margery made a flower pot from part of an acorn shell and set it on a shelf inside the play-house with some moss planted in it.

"Your housekeeping experiment has certainly been a success, Margery," was Beatrice's comment the day she was going back to college. "I sometimes wish they would not fill up the trees on the U. C. Campus with cement. But possibly a junior doesn't know everything about the way the University should be run."

SCRAPPLE.

Three and one-half lbs. end of shoulder, boil in plenty of water until meat will drop from the bones when picked up with a fork; remove from stove and cut off skin and most of fat; chop the lean meat fine, skim the water it was boiled in, return the meat to the water; stir in one loaf of bread broken in small pieces, two even tablespoons salt, one tablespoon sage, one-half tablespoon pepper and a dash of cayenne. Stir continually until the bread is a pulp. If necessary, add water to make as thick as mush. Pour in pan, when cold, cut in slices and fry.

TAN RABBIT HIDE.

Editor Home Circle: Will you tell me how to tan rabbit hide with the fur on?—Mrs. J. R., Petaluma.

A very simple but effective method is to salt the skin heavily, after having scraped off all animal tissue. Roll up and put in a dark place for three days. Then scrape off all the salt and put on enough oil to moisten the hide and knead thoroughly.

To Remove Tacks.—When tacks are difficult to remove from a hardwood floor, try putting a drop of oil on each one. This acts as a lubricant.

TO SAVE LABOR FOR FARM WIVES.

"Do you women who live on farms want to know how to make your work easier and pleasanter by new labor-saving methods?"

This is the question the University of California is asking the women of the State. Now the University has offered to send to any community a woman field agent to demonstrate "scientific efficiency" in the home, to show how the farm home may be made more homelike and attractive, and how the family may get more enjoyment from farm life. Any group of neighbor women, any women's club, or any community desiring such a demonstration, should write to the Agricultural Extension Division at the University of California, and with no charge whatever by the University such a demonstration will be given. The two women field agents, experts in household matters, sent out by the University of California for this work, spend their whole time in the field. The demonstrations are usually held in farm homes, so that the neighbors may come in conveniently and see these demonstrations under the actual conditions of farm life in California.

Floral Department.

By Geo. N. Tyler.

California Garden Flowers. By Prof. Wickson, on page 199: "The Japanese Irises are perhaps the most difficult to grow of the lot, and more are disappointed with them." In Japan they grow the best irises in the rice paddies, or rice fields, showing that they require a great deal of water. I will tell you how a lady of my acquaintance made a great success of them. She had an old fountain with a water-tight basin, with pipe at the bottom so that it could be drained. She covered the opening of the drain pipe with stones and crocks and about two inches of clean straw on top of this, also some lumps of charcoal in the stones, then filled up with rich well prepared soil to within two inches of the top. Planted her iris roots in the spring and after they were well established and growing flooded with water so that it stood over the soil for two inches. I never saw such irises in my life; they were from six to ten inches across, in all shades and colors and had from three to four feet stems. After blooming she drained off the water, but never let the soil get dry, and the following spring they did better still without disturbing them.

To Continue on Fertilizer.—Pigeon dung approaches guano in its power as a manure, also the dung of the domestic fowl is very similar in character. They both make a very powerful liquid manure, using one gallon of fresh droppings to forty gallons of water. Let it stand for forty-eight hours before using. Horn and hoof parings are good manures and should be utilized if readily obtainable. Ammonia is the most powerful of the inorganic manures and one of the most important of manures generally, since it is the chief source whence plants derive their nitrogen. It is largely supplied in all the most fertilizing of the organic manures. It is best applied by the use of sulphate of ammonia as a liquid manure, one pound to fifty gallons of water.

Potash and soda are valuable inorganic manures, but the most extensively used is nitrate of potash. The value of wood ashes as a manure depends upon the carbonate and other salts of potash which they contain. Ashes should be put on as a top dressing in a dry state and the water washes the potash into the soil.

Soot forms a good top dressing. It consists principally of charcoal, but contains ammonia, whence its value as a manure is derived. It should be kept dry until required for use.

Nitrate of soda is one of the standard manures used by florists, but if used by an amateur generally does more harm than good, for it should only be used on plants at certain stages of their growth. One pound to fifty gallons of water makes a safe fertilizer, but do not use too often; once in ten days is plenty and do not use if soil is dry.

Lime of itself is not a fertilizer, but it puts the soil in a fine mechanical condition, so that the denitrifying microbes can work and make all fertilizer in the soil available for plant food. It also sweetens sour soil and makes heavy soils more friable.

THE FARMER FEEDS THEM ALL.

The king may rule o'er land and sea,
The lord may live right royally,
The soldier ride in pomp and pride,
The sailor roam o'er the ocean wide;
But this or that, whate'er befall,
The farmer he must feed them all.

The writer thinks, the poet sings,
The craftsmen fashion wondrous things;

The doctor heals, the lawyer pleads,
The miner follows the precious leads;
But this or that, whate'er befall,
The farmer he must feed them all.

The merchant he may buy and sell,
The teacher do his duty well;
But men may toil through busy days,
Or men may stroll through pleasant ways;

From king to beggar, whate'er befall,
The farmer he must feed them all.

The farmer's trade is one of worth;
He's partner with the sky and earth;
He's partner with the sun and rain;
And no man loses for his gain;

And men may rise, and men may fall,
The farmer he must feed them all.

God bless the man who sows the wheat,
Who finds us milk and fruit and meat;

May his purse be heavy, his heart be light,
His cattle and corn and all go right;

God bless the seeds his hands let fall
For the farmer he must feed us all.

—Selected.

JOHNNY AND HIS HERO.

Jimmy Bryce was a little boy, and Gilbert Murray was a big boy. Jimmy was positive that Gilbert was the finest big boy in the United States of America, which was the same as the whole world, since the atlas could show no other country that could touch his own.

When the teacher had announced that a senior prize would be given for general excellence in study, Gilbert, as soon as recess came, had walked up to Jack Sumner, thrust his fist almost in his face, and, frowning terribly, had said, "The prize is for me, do you hear that?"

Jack had grinned and squinted at the fist, without dodging, and said, "Get it first, honey!"

Then they had both gone to work like beavers and kept at it ever since. Jimmy felt pretty worried sometimes.

"Their general excellence is too much alike," he sighed one afternoon when Gilbert had missed once, and the teacher had praised Jack's Latin composition.

"Our teacher isn't very praiseworthy," sighed Jimmy again. "When he tells you you've done very well indeed it's—it's dangerous."

The next morning Jack was not at school. By and by the Sumner maid came for his books. Jack had the grippe and the doctor had told him he must stay in for a few days, so he wanted his books to study at home.

Jimmy was a little ashamed of himself "for his feelings."

"But," he made excuse. "I didn't give Jack the grippe. He just took it himself by Providence. If he can't study as well for a headache or something, I can't help it."

Jimmy waited after school to work two examples, so he could leave his arithmetic in his desk. He had finished and was pulling the key out of the lock to lock the schoolhouse with it and carry it across the road to the caretaker, when he just

glanced at Jack Sumner's desk and saw the Latin grammar lying there.

The clock on the wall of the big, empty room ticked noisily many times while Jimmy stood stock-still, his face getting darker and darker.

What business was it of his? Latin was the hardest study. If Jack got behind on that some,—well it would help a lot. And he, Jimmy, didn't have to lug a great heavy book all the way round by Sumners'. Who would expect it?

"Gilbert is perfectly fine. If he didn't get the prize and I helped him any not to, I'd always have it against myself forever."

And—and might not Gilbert?

Jimmy's gloomy gaze turned away from Jack's desk. Straying about the room, it fell full on the little rack of books above the teacher's chair. The black book in the middle of the rack had gilt letters on it that Jimmy could see even from the door, or else he knew so well what they were that he thought he could see them.

"Holy Bible," read Jimmy, and his gaze fell like a stone to a knot-hole in the floor.

"The grippe was Providence, but this isn't Providence! It's me," said Jimmy, without regard to grammar.

Jimmy was moving at last. "It's right to do. When you know what's right, you'd better do it and stop thinking of all there is against it."

With a spiteful twitch he thrust Jack's book into his book-bag between the speller and the reader and slammed the door of the schoolhouse behind him, with the biggest, most comforting slam he could give it.

When he had gone a good mile on his long trip he saw a very familiar figure in the distance. It was Gilbert!

Jimmy hurried. Perhaps he could get past the turn in the road before Gilbert got there. But Gilbert was too quick for him.

"Hello, kid!" said he, as he came swinging up. "Did you O. K. those two examples all right?"

One of Gilbert's best ways was that he could always remember what you had on your mind.

"Yes, I did," answered Jimmy, briefly, trying to push on to the cross-roads. Possibly he looked out of the tail of his eye at the stout grammar, thrusting itself above the edge of the book-bag, and so Gilbert looked, too.

With a whoop like a delighted Indian Gilbert grabbed it.

"Jimmy, you are gold!" he shouted. "I was tramping back for that. I found it and laid it out to bring for Jack, and I walked right by it with the eyes of a bat. Maybe, if I fly, I can catch up to the hockey crowd yet. But, here, you needn't go any farther; it's for me to take it the rest of the way."

"No, no!" said Jimmy. "You go and fly. It isn't far now, I'd just as lief finish."

Which was the exact truth, for a light heart had shortened the way to "nothing at all."

"I'm glad," said Jimmy to himself, with a somewhat breathless giggle, "that he doesn't know I was so slow at it. He is perfectly fine! Gilbert is the perfectly finest boy I ever saw, whether he gets the prize or not. I guess, anyway, some things they don't give prizes for are better than those they do."—The Presbyterian.

California Garden Flowers

TREES, SHRUBS, VINES.
By E. J. Wickson, A. M.

is just what you need as an aid in your every-day work in the yard. It is written by a Californian who knows, to meet your conditions. It tells the how, when and why, and is very practical in its suggestions.

The book is divided into six divisions and these parts are divided into twenty-six chapters, which cover California conditions, cultural suggestions, California garden year, ways with garden plants, shrubs, trees and vines, methods against pests and diseases.

The work contains 258 pages of closely packed information of absolute value to plant growers, besides numerous illustrations—handsomely bound in cloth. Price, \$1.50 postpaid.

CORNED BEEF.

Rub each piece of beef well with salt, mix with 1-10 part of saltpeter until the salt is dry upon the surface. Put aside in a cool place for 24 hours and then repeat the process, rubbing in the mixture very thoroughly. Put away again until the next day, by which time the pickle should be ready. This is made of five gallons of water, one gallon of salt, four ounces of saltpeter, one and one-half pounds of brown sugar. Boil this brine ten minutes, let it get perfectly cold, then pour over the beef, having wiped the latter en-

tirely dry. Examine the pickle from time to time to see if it keeps well. If not, take out the meat without delay, wipe it and rub in a dry salt, covering it well until you can prepare new and stronger brine.

Mrs. de Fashion (to her new Chinese cook): "John, why do the Chinese bind the feet of their women?" John: "So they not trotee 'round kitchen, and botheree cook."—Life.

Crushed rock candy of various colors is attractive to serve in place of the ordinary lump sugar.

CARE OF THE NAILS.

A weekly manicure with five minutes' attention to the nails each day should keep the hands in good condition. For the manicure, you will need a bowl large enough to hold a quart of water, in which to immerse the hands and for instruments, a nail brush, cuticle scissors, nail file, an orange wood stick, peroxide and toilet soap. Filing the nails is much better than cutting them and this should be done first. Then dip the hands, one at a time, in the warm, soapy water and when softened use the orange wood stick wrapped with cotton dampened with peroxide to remove the dirt under the nails. This work should be done gently. Then use the flat end of the orange wood stick to push back the cuticle at the base of the nail. If your hands have been neglected and there are rolls of loose skin, cut it away with the cuticle scissors. Hang nails should be closely clipped and a little bit of cold cream applied to the nail and surrounding skin. If a polish is desired, use a nail powder with a chamomis buffer and rub briskly.

For the daily care, use the orange-wood stick wrapped with cotton and keep the skin well pushed back from the nail.

TEA-TABLE IDEAS.

Place a whole clove in the center of each slice of lemon on the lemon dish.

Nut bread thinly sliced and buttered makes delicious sandwiches.

A dash of paprika on cheese crackers adds both to the flavor and appearance.

Baskets are much in favor for small cakes or cookies. A gay tassel on the handle pleases the eye as much as the cakes please the palate.

A dish of salted nuts adds snap to a simple tea.

Trays of silver or china are very good style for sandwiches.

The toasted cheese sandwich is appetizing and more satisfying than the plain toast.

Jam pots of either glass or china are good style.

A clergyman of Cambridge, Mass., many years ago told his people that, if he spoke softly, those at the end of the church would not be able to hear him, and, if loud, those near the pulpit would awake!

Paint Without Oil

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-Five Per Cent.

A Free Trial Package is Mailed to Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powderpaint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof, sanitary and durable for outside or inside painting. It is the cement principle applied to paint. It adheres to any surface, wood, stone, or brick, spreads and looks like oil paint and costs about one-fourth as much. Write to Mr. A. L. Rice, Manufacturers, 146 North Street, Adams, N. Y., and he will send you a free trial package; also color card and full information showing you how you can save a good many dollars. Write today.

Good Health.

(By H. E. Pastor, M. D.)

The Barefoot Boy in Prose.

An Oakland correspondent writes a somewhat effusive communication to a San Francisco daily extolling the health-imparting virtues of bare legs and bare feet for children. This nature worshiper is a trifle overly enthusiastic in his advocacy of unclad extremities. There may be a legitimate difference of opinion as to the wisdom of allowing little boys and girls to go with short socks and bare legs in all temperate climates, in almost any kind of weather, as the tendency is for the exposed parts to become hardened and inured by the exposure, just as do the unclothed face and hands of all of us. And the hardening process has a salutary protective effect, though the transition from well-stockinged legs to bare legs should not be too sudden.

But the barefoot proposition is quite another matter, and for the reason that the foot, unlike the leg, comes in direct contact with the ground, and "Mother Earth" is not the sweet, innocuous thing that poets and nature lovers would have us believe. Besides the stones and sticks and splinters and thorns with which the "primrose path" of youth is plentifully bestrewn, bestowing bruises, punctures, scratches, and cuts without number, with their infections and disablements and distortions of pedal gracefulness, science has known for a long time that the bare ground, and especially the ground of the farm, over which horses, cattle and poultry roam almost at will, is a hotbed for bacteria and disease germs of various kinds, many of which have a habit of attaching themselves to the skin of their bare-footed victims, and, by burrowing or otherwise, gaining an entrance into the body. The widespread hookworm of the South, so extensively exploited in the newspapers, is but one example of this kind.

But the hookworm, you say, is not found north of the Mason and Dixon line? Perhaps not. But the hookworm is not the only offender. There are others, and even worse, that are not so fastidious about having a tropical or sub-tropical clime for their abode. There is the bacillus of lockjaw, for instance, that loves to roost by the million on a rusty nail or other errant scrap of neglected iron; the bacillus of typhoid, which haunts the dung and the dirt necessarily so plentiful in the farm environment; and there are others. The bacillus of ordinary blood poisoning is everywhere, and the same might be said of the bacillus of tuberculosis. Did you ever step on a bee, dear reader? This writer did so once when a boy; and though that was a long while ago, he still vividly remembers it, for the bee resented the indignity, and bare feet gave him the chance. There are other things of earth just as sensitive as the bee, and even more vicious about letting you know it.

So, we say, don't despise the humble shoe just because it is a human invention. There is no other article of human wear that contributes more to man's (and boys' and girls')

protection and comfort. Supply your children with the necessary footwear, if at all possible. Dame Nature does a great deal for man, but she leaves a few things for him to do for himself. There is no more sense in trusting nature to protect bare feet than to protect bare bodies or to fill empty stomachs, or to find beds for weary little ones at night-fall.

Rice in Health and Disease.

As California is beginning to attain distinction as a rice-growing center, some mention of the peculiarities of this food staple may be interesting to the readers of the Rural Press. It is well known, of course, that rice constitutes a large part of the dietary of the peoples of eastern and southeastern Asia, and that it appears quite generally, as a palatable and wholesome article of food on bills of fare throughout all civilized countries. In countries where rice is almost the sole article of food the natives are noted for their endurance. It cannot be said, however, that they enjoy real robust health, such as do peoples using the more varied diet, with meat as an ingredient. Rice contains but a very small proportion of albumen and fat—about five or six per cent of the former, and less than one per cent of the latter.

Owing to the small amount of mineral salts contained in rice it is uniritating to the kidneys, and is thus a safe food for patients suffering with any form of kidney disease. This poverty in mineral salts, however, gives rice its insipid taste. Its high digestibility and easy assimilation make it a desirable nutrient in stomachic and intestinal troubles. In gouty and arthritic diseases it is a desirable diet, as it leaves little or no uric acid in the system.

Shelled and polished rice, the form in which this grain is usually sold in our stores, is much less wholesome than unpolished rice as the latter contains about five times as much phosphorus as the polished article; hence the growing prejudice against the polishing process. That dreaded oriental disease beriberi, is believed by investigators, to be due to the large consumption of rice in its polished form and its deficiency of phosphorus. As confirmatory of this view, foods rich in organic phosphorus have been found to be both preventive and curative of this disease.

The lesson we are trying to convey in these few remarks is this: Rice as an exclusive article of diet is not satisfactory; as an ingredient in a mixed dietary it is unexcelled.

Beautifiers.

Women should be somewhat chary of the cosmetics usually passed over the drugstore counter. Many of them—most of them in fact—contain lead and arsenic, and while temporarily improving the skin's appearance, they are in the long run positively harmful. In time, they cause the skin to crack, wrinkle and scale—to assume a sort of crepe appearance—and no subsequent treatment with creams or other emollients will ever restore the skin's original fine texture. About the only way of preserving a naturally fine complexion, or of culti-

vating some semblance of such, is to adopt a proper dietary, take plenty of exercise, and secure an abundance of sleep in a well ventilated bedroom. Anything that contributes to the general health conduces to a good complexion. And it's a complexion that costs nothing and doesn't rub off.

SCHMIDT LITHOGRAPH CO.,
SAN FRANCISCO.

SAN FRANCISCO.

San Francisco, Jan. 10, 1917.

WHEAT.

The Eastern market is rather erratic, but with an export demand which causes a rather firm feeling. Local conditions show little change. Northern bluestem is cleaned up here, and California club is higher, other lines being firm as last quoted. [First-hand prices on strictly first-class grain, San Francisco.]

Sonora wheat \$24.75@2.80
Northern club 2.65@2.70
Calif. club, ctl. 2.60@2.65
Northern Bluestem None offered
Northern Red None offered

BATTLE.

The spot market is firmer, with a slight advance in feed. This is partly due to an easing up of the car shortage, permitting the movement of a large tonnage already sold for shipment. Indications favor a firm market the rest of the season.

Seed, ctl. \$ 2.50
Shipping, ctl. 2.35@2.40
Choice feed, ctl. 2.22½@2.25

OATS.

A few small lots of seed are appearing, but hardly enough to quote. Feed shows a firmer tone, white being higher than last week, with a lively demand and no excessive offerings.

Red feed \$1.80@1.85
White 2.15@2.20

CORN.

Some Eastern corn is offered, and California yellow, though still damp, is moving well at an advance. Sorghum grains continue in good demand at unchanged prices.

[First-hand prices on strictly first-class grain, San Francisco.]

Eastern Yellow, ctl., in bulk \$2.10@2.15
California, sacked 2.20@2.25
Milo Maize 2.00@2.20
Egyptian 2.20@2.25

BEANS.

The demand is still a little quiet, but shows signs of revival, and the market in general is very strong, with further advances in most lines still possible, and no marked decline in prospect. The outside figure on red kidneys has been reduced, as the consuming demand was curtailed on the basis of recent quotations; but the entire stock of this variety left in the State is hardly over 3,000 sacks, and most holders are very firm. Pink and cranberry beans have again advanced, and colored beans in general are quite strong, with a demand from some of the canners.

[Uncleaned, on wharf, San Francisco.]
Bays, per ctl. \$5.50@5.75
Blackeyes 4.50@4.75
Cranberry beans 6.60@6.75
Horse beans 3.25@3.50
Small Whites (south) 7.00@10.50
Large Whites 8.10@9.50
Pinks 6.20@6.75
Limas (south) 7.75@7.90
Red Kidney 9.00@12.00
Mexican Reds 6.50@7.00
Tepary beans 5.90@6.00

HAY.

Arrivals in this market were a little short last week, but are increasing with better weather, which permits the use of stock cars, etc. The car shortage is being relieved a little, but is still bad, as the box cars are urgently needed for high-priced goods. Local business continues dull with little export demand; though offerings move readily, and there is quite a demand for cheap grades, of which little is offered. Country demand is exceptionally strong, as the green feed is still in poor shape; and a good cleanup is expected. Some large sales of alfalfa have been made recently in the country, where prices are comparatively high.

[Prices per ton, carload lots, San Francisco.]

Wheat, No. 1 \$16.00@18.00

POTATOES, ONIONS, ETC.

Local garden truck of most kinds is very scarce. Lettuce has been fairly plentiful, but celery is scarce and higher. Mushrooms are plentiful, but cultivated stock brings good prices. Mexican, Cuban and Florida stock is a prominent factor. Cold storage onions are about cleaned up, and Oregon stock is moving off rapidly, causing a sharp jump in values; though the extreme figures are hardly expected to hold, as they cut the consumption. Potatoes also are moving well, with very limited supplies, and all grades are advancing. Garlic also is stronger.

Lettuce, crate \$1.00@1.25

Onions 4.50@5.50

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

Garlic, new crop, per lb. ... 3¼@4c

POULTRY.

Eastern chickens are again coming in, but in very moderate quantities; and with local offerings also very light for a few days, prices are higher. A reaction, however, already has set in, as these extreme values are bringing much larger supplies from nearby points; and lower prices are expected soon. Dressed turkeys are scarce and bring good prices. Extra good Belgian hares do a little better.

BUTTER.

No further Eastern movement is reported. Eastern markets being too unsettled to warrant shipment with local prices as high as they are; but some large Government inquiries for Manila have brought more firmness to the market, and while offerings keep up fairly well, prices have stiffened. A jump to 36c the first of the week, however, was not held.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.

Prime 1sts	33½	33½	34½	35	34½	34½
Firsts	33	33	33½	34½	34	34

EGGS.

Both grades have shown rather sharp fluctuation in the last week, larger receipts causing a little easiness a week ago, while the last few days have brought a jump very unusual at this season. Pullets are but little below extras, owing to the absence of Eastern offerings; and the top grade is no doubt feeling the same influence. Supplies, also, are hardly increasing as was expected.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	36¼	36¼	38	39¼	39¼	40
Sel. Pul.	34¼	36	37¼	38¼	38¼	38

CHEESE.

The market still feels the effect of Eastern shipments, though little moving in that direction just now; and flats are higher again. Jack cheese, since the holidays, has dropped back a little.

[S. F. Dairy Exchange prices.]

Y. A.s, fancy 20¼c
Fancy Calif. Flats, per lb 18c
Monterey Cheese 17@19c

DECIDUOUS FRUITS.

Bellflower apples are again lower, as holders are anxious to clean up; but Newtowns remain steady and are moving fairly well, with a good demand for shipment but little chance to ship. Stocks now in storage here are estimated at about 55,000 boxes less than last year. Northern apples, however, are offered freely and tend to ease the market.

Apples
Bellflower, box \$.65@.75
Newtown 1.00@1.15
Pears, Winter Nellis 2.25@2.75

DRIED FRUITS.

The dried fruit situation is still rather uninteresting, as regards current business; and with nearly everything sold the growers are giving more attention to prospects for the new crop. It is too early to speak with much certainty as to future market conditions, but the local packers appear very confident, basing their calculations on the fact that the markets will be absolutely bare long before new fruit is available, while on nearly any basis of figuring the consuming demand of the world will be fully as great as for the past year, and possibly much greater. For the present prices are firmly maintained, and packers expect a gradual increase in the value of their moderate holdings, which would be reflected on anything still in growers' hands. As for prunes, a prominent local packer estimated the stock on the Coast at the end of the year at not over 10,000 tons, with not over 300 tons in growers' hands. [Net to growers, bulk basis, f. o. b. shipping point.]

Apples, new crop 8 @ 8¼c
Apricots, per lb. 1916 15 @16c

Figs, white, 1916 None offered

Calimyrnas, 1916 None offered
Prunes, 4-size basis, 1916 6½@7c
Pears 7 @ 8c
Lake County Pears 11 @12½c
Peaches 6 @ 8½c

HONEY.

Comb honey has been very dull here since the holidays, with no large supplies, but very little demand, and prices are only steady at the old level. Extracted of all grades is very scarce, as some large sales have recently been made for export, absorbing most of what was left either here or in the country. With a continued fair demand locally, prices show a further advance.

Water white, comb 13@14c
Amber 8 @ 9c
Light Amber 10@11c
Water white, extracted 9@15c
Light amber 7 @ 8c
Dark 5½@6c

HORSES.

There is no demand here, but the latest sales have been quite successful on account of the country demand, which has started in well and promises to be active for the next few months. All offerings of desirable quality this week were disposed of readily at full prices; and one car was bought here for the Los Angeles market. There has been no war business here for some time, owing to lack of shipping facilities. No mules are used here, but there is a good demand for heavy and medium weight stock at outside points.

Drafters, 1700 lbs. and up. \$ 250
Drafters, 1550 to 1650 lbs. .. 150@200

1000 to 1200 lbs. 150@175
1200 to 1400 lbs. 175@200

GROCERIES.

The Diamond Match Company has raised prices on its matches 10 to 15 per cent. Canned milk is extremely strong. Provisions and canned vegetables are steady at high prices, with trading quiet. Advances are noted on some kinds of syrup; washing soda and lye; and some lines of tea.

LOS ANGELES.

BUTTER.

Receipts of week ending Jan. 9, 1917
—258,900.
Receipts of week ending Jan. 9, 1916
—272,120.

A steady and firm market was had the past week. Receipts were light, only about enough to supply the home demand, hence there was little incentive to speculate and trading on call was light. In San Francisco, fresh extra advanced 1¼c up to Monday. Chicago was steady and firm for the same time and so was New York. Chicago maintained a 39c market on extras throughout the week and New York a 40@40¼c market on extras up to Monday. While current receipts are running as heavy as a year ago, the cold storage stocks are lighter, both here and in San Francisco and it is this want of reserve stocks, compelling distributors to rely upon the receipts from day to day, that caused prices to rule so much higher than a year ago. Tuesday there was no trading on call and no change in the market. San Francisco was 35c, down 1c, and New York was 1c lower, while Chicago was still 39c for extra.

EGGS.

Receipts (railroads) for week ending Jan. 9, 1917—1025 cases.

Receipts (railroads) for week ending Jan. 9, 1916—1336 cases.

The new year started out strong the past week with a good demand both on home and shipping account. While the receipts were somewhat better than the week before, they were lighter than the same time last year. Cold storage stocks are also lighter both here and in San Francisco than this time last year. With tourists now beginning to arrive, increasing the home consumptive demand and a car being made up for shipment East, caused a strong market, and by Monday, on call, fresh ranch case count had advanced 3c and extras 3c and pullets 2c, making the market 3c higher than a year ago. In San Francisco fresh extras sold up during the week, while Chicago was steady and firm and New York advanced 4c on first. Tuesday the market here was quiet but firm on change, but no trading. We quote fresh ranch case count. 39c
Extras 40c
Pullets 36c

POULTRY.

Continued light receipts the past week and an improved demand caused an advance all round. There was no Eastern poultry in and the Thanksgiving and Christmas demand left a light reserve supply in the country. Broilers, fryers and hens were all wanted at 1@2c advance. Turkeys, ducks and geese also sold without trouble and brought more money. Tourists have commenced to arrive, which has given new life to trade.

The Hay Situation.

San Francisco, Jan. 10, 1917.

The San Francisco hay market has undergone a marked change in the last few years, according to leading dealers, as a result of the introduction of motor vehicles, which has greatly reduced the city consumption; and the reduction is still going on. Some dealers estimate the drop in local requirements at 50 per cent in the last three years, and the retail hay business in San Francisco has practically gone out of existence. Formerly there was a daily hay auction of arrivals at the railroad yards; but carload buyers are now so few that the auction has been abandoned.

The decrease in local demands has been made up for by the growth of interior markets, following more intensive development and larger stock feeding operations; and the acreage, on the whole, has been maintained, new acreage replacing that turned to other uses. Export trade has been an important item the last few years; less so this year than last.

Leading dealers estimate the crop for last year in San Francisco territory at about 4,000,000 tons; the average price to growers being around \$13, and the average price to consumers, at least in the city, about \$17. The 1915 crop was about 25 per cent larger, with an average price to producers of about \$11 per ton.

The market for the last four or five months has been governed largely by the car shortage, which has made it impossible to move the hay as desired, with the result that both alfalfa and grain hay within easy reach of water shipment are rather closely cleaned up, while there is still considerable hay in warehouses at points depending on rail shipment. At most points, the hay is now out of growers' hands; though growers still own most of the stored hay around Modesto, according to advices from that section. Arrivals in San Francisco for November were 6882 tons; for December 7906 tons. For the same months, respectively, last year, receipts were 10,329 tons and 8,985 tons. In 1915, also, some 40,000 tons were shipped to Australia, which was not repeated this season, the only exports being routine shipments to Manila and Hawaii.

Light shipments in this direction this season were more than made up for by the strong demand in the country, as green feed conditions have been poor, owing to cold weather, and there will be a great deal of feeding until there are two weeks of warm weather.

Dealers estimated that there were about 150,000 tons available in the San Francisco territory Nov. 1, about the same as the previous year. Last year it was all used by the time the new crop appeared, and the same condition is assured if feeding continues much longer at the present rate. In fact it is believed that present supplies are not more than enough to meet requirements for the rest of the season, and values accordingly should be well maintained. This, it should be specified, is the view of dealers, who now hold most of the hay; but it is supported by good evidence.

The car situation is improving, and local supplies are ample, though some of the stock has come in damaged. Local buying from now on will probably be from hand to mouth, as buyers do not like the prices.

As for planting, acreage of grain hay in many districts will be much larger than last year, in some places as much as 20 per cent; though a great deal of alfalfa is being plowed up in some of the principal districts to be replaced by grain or other more profitable crops. New acreage of alfalfa seems to be comparatively small. To sum up the outlook, the market is expected to clean up well, with no decline in prices, and early offerings of the new crop, at least, should be well received. Values for later offerings will depend on demand, which is problematical.

We quote from growers:
 rollers, 1 1/2 to 2 lbs.25@26c
 rollers, 2 1/2 to 3 lbs.22@23c

HONEY.
 There was very little doing in this market the past week. It is rather early in the year for trade to take hold. While there was very little demand for either extracted or comb, holders were firm in their views and old prices were fully sustained. Stocks are so light that it is thought that they will be exhausted before the new crop comes in. Beeswax in good demand and higher.

We quote from growers:
 Water white, pound7 1/2c
 White sage, lb.7 1/2c
 Light amber sage, lb.7c
 Light amber alfalfa, lb.6 1/2c
 Fancy white comb, lb.10c
 Light amber comb9c
 Beeswax29c

BEANS.
 It was again quiet in this market

the past week. It is little early in the year as yet for the trade to take hold. But while the movement just now is light holders are firm in their views and the country is not pressing sales. A very good demand, however, is looked for a little later on, and the feeling in the market is one of confidence. Prices steady and firm all round.

We quote from growers:
 Limas\$7.75@8.00
 Large white9.25@9.50
 Small white9.50@10.00
 Pinks7.25@7.50
 Blackeyes5.25@5.75
 Tepary5.75@6.25

HAY.
 There was more life to the market the past week than for some little time and a general advance was established. All classes of hay selling up \$1.00@2.00 per ton; that is, good dry hay. Low grades also showed more life and the market for it was firm. Receipts were only moderate and the reserve supply on hand was not large.

We quote f. o. b. Los Angeles:
 Barley hay, ton\$18.00@20.00
 Oat hay, ton19.00@21.00
 Alfalfa, northern, ton16.00@17.00
 Alfalfa, local, ton18.00@20.00
 Straw, ton9.00@10.00

a slightly better price. Receipts are falling off some but the supply in the country seems to be holding out satisfactorily for this time of the year.

[Rough, docked 20 pounds, piggy sows, 40 pounds, stags 80 pounds.]
 100 to 150 lbs.8 1/2c
 150 to 300 lbs.9 1/2@9 3/4c
 300 to 375 lbs.9@9 1/4c

WOOL buyers are flocking into the Red Bluff district, but reports from there state that they are not buying. The same condition is reported from Bakersfield. The trouble seems to be the uncertain idea growers have as to values, buyers complaining that no matter what their offer may be it is turned down. This indicates a firm feeling on the part of growers and nobody seems to know what it will develop into. Boston reports a stronger market and no peace talk. Lack of trade prohibits us making any change in quotations.

 dry, large3.00@3.50

Los Angeles, Jan. 9, 1917.

CATTLE: There was a little more doing the past week, and a stronger market for cattle all round. The cattle coming in were mainly from California and Arizona and in very good condition. Killers all wanted supplies and under the influence of strong markets East prices were bid up 25c per cwt. all round and this advance was maintained throughout the week.

Quotations f. o. b. Los Angeles:
 Beef steers, 1000 to 1100 lbs. \$8.25@8.50
 Stockers and feeders5.50@6.00
 Prime cows and heifers6.50@6.75
 Good cows and heifers6.25@6.50

HOGS: A steady and firm market was had the past week. Arrivals were a little better but as the California hogs coming in showed an improvement in quality old prices were maintained, while the Idaho hogs were firm under the influence of high markets in the Central West. Killers were all in the market and what hogs arrived were disposed of without trouble.

Per cwt. f. o. b. Los Angeles:
 Heavy, averaging 250@300 lbs.9.25@9.50
 Mixed, 200@2509.25@9.50
 Light, 175 @2009.25@9.50

Rough docked 20 pounds, piggy sows 40 pounds and stags 80 pounds.

SHEEP: While prices show no quotable change, the market the past week was steady and firm. Utah and Idaho continue to give us a fair number of very good sheep and lambs and what came in were soon absorbed by killers at full quotations. Sheep and lambs both meeting with a good demand and if here more could have been disposed of. Strong markets East causing buyers to bid up strong for everything in this line.

Per head f. o. b. Los Angeles:
 Prime wethers\$7.00@7.25
 Prime ewes6.50@6.75
 Yearlings6.50@7.00
 Lambs6.50@7.00

CALVES: Not many coming in and what on sale the past week sold without trouble and brought steady and firm prices. Selling at \$8.50@9.50 per cwt.

Special Livestock Market Report.

San Francisco, Jan. 10, 1917.

[Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F. Hog prices subject to seller standing one-half of all hogs condemned by government inspectors.]

BEEF prices are on an upward trend which nobody seems to know how long will last. Buyers from Los Angeles and Portland as well as practically all of the local concerns are scouring the country for cattle, including Nevada points. Small operators without feed lots to draw on are particularly hard hit by the present scarcity and even those with feed lot supplies are competing for both small and large lots. It is a sellers' market, as our quotations indicate:

Steers, No. 17 1/2 @8 1/4c
 No. 27 1/2 @7 3/4c

Cows and Heifers6 1/2 @7 c
 No. 25 1/2 @6 c
 Bulls and Stags5 @5 1/2c
 Calves, light8 @8 1/2c
 Medium7 @8 1/2c
 Heavy6 1/2 @7 c

SHEEP are in fully as great, if not greater, demand than cattle and packers are having to go to Utah for lambs at a price which seems prohibitive. It seems certain that the advancing price which has been made necessary on dressed mutton will materially reduce consumption and this will be looked on favorably by killers at the present time. Lambs even at our quotation are considered a bargain.

Prime Wethers8 @8 1/4c
 Ewes7 @7 1/2c
 Lambs10 1/2 @11 c

HOG prices remain firm as last quoted but strictly top hogs will bring

The Jump in Onion Prices.

Within the last fortnight local onion prices have jumped from about the normal level for this season to nearly twice that figure, and some of the larger speculative holders have been asking as high as \$5.50 per ctn., though it is doubtful if that price can be maintained. The rise is due to a general shortage all over the country, which has not been felt here sooner owing to scarcity of cars to take the stock to other markets. The usual movement from the growers to storage operators took place some time ago, and stocks have been rather closely held, being now in the hands of a few local firms; the estimated stock of California onions in cold storage being less than 300 cars. Prices only a little lower than the present have occasionally been reached early in the spring, just before the new crop came in, but seldom if ever so early in the year. Oregon, which was expected to relieve the situation, has only about 100 carloads left, largely owned by local interests.

The crop for the country as a whole last year was light, and the Coast States have been called upon for supplies for all parts of the East, South and Middle West during the fall, instead of merely for the West, as usual. To keep enough for the local market, it has been necessary to raise the prices, as the outside demand continues. About twice as much has been shipped out as usual, going to markets never before reached; five cars recently went to Florida, and some has gone to New York. Apparently everything will be gone before the Texas and Imperial Bermudas and Australian onions arrive in April.

Second Thousand

Answered Questions in California Agriculture.

A Sequel to "One Thousand Questions in California Agriculture Answered."

BY EDWARD J. WICKSON,
Editor Pacific Rural Press.

First Edition—1916.

256 pages, text only. Cloth bound.

This book is made up from a selected list of questions asked by farmers and answered in the columns of the Pacific Rural Press. Divided into nine parts, covering Fruit Growing; Vegetable Growing; Grain and Forage Crops; Soils, Fertilizers and Irrigation; Live Stock and Dairy; Feeding Animals; Diseases of Animals; Poultry Keeping; Pests and Diseases of Plants.

Price, \$1.50 per Copy, Postpaid.

CALIFORNIA GARDEN FLOWERS

SHRUBS, TREES AND VINES.

BEING MAINLY SUGGESTIONS FOR WORKING AMATEURS.

BY EDWARD J. WICKSON.

Hon. President California State Floral Society.

Contents by Chapter Titles:

Introductory. Climatic Characters and Advantages. Soils and Fertilizers. Tillage and Irrigation. Laying Out the Garden. Elements of Propagation. Growth of Plants from Seeds. Growth of Plants from Buds. Hot-Beds and Cold-Frames. The Amateur's Greenhouse. Planting, Pruning and Training. Characters, Adaptations and Requirements of the Months. Lawns and Ground-Covers. The Rose. The Carnation. The Chrysanthemum. Open-air Herbaceous Plants. Bulbs, Tubers and Roots. Flowers for Hot, Dry Regions. Water Plants in Gardens. Choice and Treatment of Arborescent Plants. Shrubs Approved. Garden Palms. Trees for Ornamentals and Shade. Climbing Plants for Gardens. Methods Against Plant Pests and Diseases.

First Edition—1915.

Price, \$1.50 per Copy, Postpaid

CALIFORNIA Poultry Practice

BY MRS. SUSAN SWAYSGOOD.
160 pages of text, besides many full-page illustrations.
Cloth bound.

In writing this book the author, after a life-time of active, practical and successful experience in poultry raising on the Pacific Coast, has endeavored to show the farmer how he can make the poultry department of his business more profitable. It deals with actual conditions—not theories—and covers every phase of the industry from eggs, chicks, disease and remedies to the profitable marketing of the products of the poultry farm.

Price, \$1.00 Per Copy, Postpaid.

CALIFORNIA HOG BOOK

BY W. S. GUILFORD.

A Practical Treatise on Hog Raising in California.

Contents by Chapter Titles:
The Hog Industry. Hog Growing Conditions. Description of Hog. Judging and Selecting Hogs. Care of Boar. Care of Sow. Growing Pigs. Hog Feeds. Hog Feeding Suggestions. Hog Growing Systems. Hog Buildings. Hog Appliances. Handling Hogs. Hog in Health and Disease. Profit in Hog Raising. Markets and Marketing. Value of Pure-Bred Stock. Breeds. Hog Breeder. Hog Breeding. Exhibiting Hogs. Home-made Pork Products.

First Edition—1915.

Price, \$2.00 Per Copy, Postpaid.

"Chunk" Had All of the Qualities We Commonly Term "Good" in a Hog and Weighed 250 Pounds.

The Story of a
Trip Through a
Packing House
with Two Hogs,
One a Scrub and
the Other Well
Bred.

"Razor" Was an Inbred Mongrel, Weighing 185 Pounds Live Weight.

The Tale of "Razor" and "Chunk."

[Written for Pacific Rural Press.]

RAZOR and Chunk were just two hogs among many hundred in the yards of the Western Meat Co. at South San Francisco. Both had been shipped from Kings county, but from different districts and by different consignors. Razor was a sow weighing 185 pounds, and appeared to have farrowed one or more litter of pigs. She was not beautiful to look at, possessing a long tooter-rooter head and snout, a sleek, narrow, jack-rabbit body and a pair of hams that betrayed her wild-beast characteristics. That she was alert to any and all occasions was demonstrated by her actions when brought from a pen of her mates for our inspection, for her head was lowered in defiance during most of our short visit.

Chunk was the direct opposite to Razor. He was a barrow and was unmistakably Poland China, so much so as to lead one to believe that he may have had pedigreed ancestors on both sides. He had the ideal small head and neck, a broad, strong back, straight sides and even belly line. These, together with big square hams, well carried out from tail setting to hock joint, was bound to create admiration. And his straightforward, head-up look at you convinced you he was familiar with the habits of man. Also, he weighed 250 pounds.

The Last Trip.—After selecting them we had to wait a while for the drive from yards to killing pen. Razor went first as she was what is termed a "Shipper" hog, one whose carcass is sold as a whole to retail butchers, and at that hour "shipper" hogs were being worked through the killing floors.

The foreman on the killing floor as well on the dressing floor were acquainted with our object of seeing Razor and Chunk go through the plant, and kept careful tab on Razor so she would not lose her identity, for even though we were careful observers the rate of speed at which a hog goes through the killing and dressing process (as many as 1,500 in a 10-hour day at times) forbade our being in the way of workmen.

Razor Is Killed.—As Razor came in from the holding corral with her mates, onto the killing

pen floor she was easily recognizable by her long snout. We watched the workmen fasten the strong chains around her long, thin hind legs, hoist her by power-driven tackle to the overhead trolley track, where she was pushed, head down and squealing, to a workman with a sharp knife and sure hand. A quick push on the sharp point at her throat, a jerk downward, and Razor was in another world.

Removing Bristles.—But not for us. She was shunted down the track and lowered into a vat of boiling hot water where, chain freed, she floated around till another workman could catch one of her legs and push her into a revolving cylinder that was to rub off the greater portion of her bristles. From this she received almost her first human touch by workmen with small scrapers, who were to still further rid her of bristles and again run her carcass onto the overhead track, after marking with indelible pencil on her hide the lot number furnished by the yard foreman. This time she was suspended with hind legs spread apart by a wooden gambrel. A finishing touch now by three expert bristle removers, each watching a certain part of her carcass, made Razor ready for an automatic cold water shower bath through which she passed on her way to the first Government Inspector.

Using the killer's slit in her throat as an inspecting point, Uncle Sam's representative, with a small, sharp knife and expert skill, cut into the neck glands, where tuberculosis is most apt to be discovered. Fortunately, Razor had no symptoms of this costly disease, although four of the next six hogs that he examined were doubtful and were tagged with a "Retained" tag. Propelled slowly but surely on the overhead track by power-driven chains, Razor finally came to the dressing point, where another workman with a sharp knife cut her open and removed the intestines and the head, also the leaf lard, which in her case only amounted to about three pounds. After passing from the dressing floor to the final washing floor where a man with a hose went over the entire carcass with live steam, the final weighing was accomplished.

(Continued on page 88.)

Well-Bred and Well-Fed Hogs Have Every Advantage over the Scrub, Including a Better Dressing Percentage.

PROGRESS WITH PRUNES.

OUR latest advices from the Santa Clara valley are that due progress is being had in signing up producers of prunes and apricots, and that the machinery for the election of trustees, who will give the association its final form, will soon be set in motion. It was to be expected that the largest district, from Contra Costa to San Benito, which represents more than half the acreage of these fruits, should be perhaps slowest to sign up its large share of the consenting acreage. Large bodies proverbially move slowly, and, if our physics are right, large bodies have more of the inertia which inheres in bulk and in conflicting interests, forces and preconceived notions. But, of course, the Santa Clara district may now be expected to speed up in its support. There has now been ample time for light, courage and foresight to penetrate its bulk and to be sure that, if all its convictions have not yet been fully provided for, there will be plenty of chance to conserve all that there is good in them in later actions. The immediate point is to get under way with munitions enough for a strong drive, and this, we are advised, is now what they are doing in Santa Clara valley. If an organization is not just what an individual requires at first, there is always a chance for wisdom to more fully possess it. If support is withheld for such a reason, there is no chance at all. Go to it briskly, friends, and do not stay out in the company of the chap to whom belongs the hindmost.

A DRIVE ON WEINSTOCK.

A LEGISLATIVE session which does not spring a sensation or two to announce its coming into official existence at the State capitol would be as strange a thing as a rural Fourth-of-July celebration which did not provide a sunrise salute with all the anvils available. The session which opened in Sacramento last week could, of course, not neglect this regular announcement of its birth, and thus came about the sensation that Col. Weinstock, State Market Director, was to be loaded with black powder and fired! Briefly, the charge seems to be that the State Market Director had not done what the law provided. And the charge seemed to convey the idea that the law required that all producers be provided with motor-trucks, and all consumers with market-baskets, and that both be required by law to rush together with one accord in one place and dispose of all California crops by direct trade during the first year of the Market Director's incumbency! And the second charge was like unto the first in stupidity, viz.: that instead of establishing direct trade in this tragic way, the Market Director had been busy all the time in trying to organize trusts of producers which would cause consumers' baskets to be perpetually empty.

What Col. Weinstock's answer will be to such charges we do not know. We have no authority to speak for him, consequently we shall speak about him as we like—without his consent, objection or consultation.

AN IMPRACTICABLE LAW.

NO MATTER how good was the intention of those who urged the State Marketing law upon the Legislature of 1915, they secured an enactment impossible of execution, or even attempt at execution, without running the State into a deficiency debt which the State Board of Control would never stand for. This is the declaration of purposes by the law itself:

"Section 1. There is hereby created the State Commission Market, a State organization to carry on the business of receiving from the producers thereof, the agricultural, fishery, dairy, and farm products of the State of California, and the selling and disposing of the same on commission, as herein provided."

But there was nothing provided except permission for the Market Director to do the wildest things which could enter into the mind of a visionary trade reformer. He could have hired a lot of warehouses, corrals, and clerks in all parts of the State and invited everybody to send in produce—which would have been, at first, largely, the bum stuff which the producers thereof could not sell in any of the usual ways, and which no one would buy, except at a sacrifice. Theoretically, the Market Director could cover his expenses by the charges on the consignments made to him, as the law contemplates, but practically he would commit the State to a very doubtful and costly experiment, because the bad stuff would kill itself and the attitude of the buyers would kill whatever good stuff happened to be caught in bad company. An energetic, optimistic Market Director, following literally the trail blazed by the law, would quickly make the State a debtor and a laughing stock. Governor Johnson, of course, clearly saw this situation and danger, and waited six months before making an appointment under the law. When he saw that something could be done for the public good by working down to the fundamentals underlying the law and disregarding its superficial, visionary and impracticable provisions, he appointed Col. Weinstock, who is well known and tried in submarine economics.

JUSTICE TO PRODUCERS IS FUNDAMENTAL.

ANYONE who has any penetration in his eye can easily see that a fair chance to the consumer must proceed, not from any experimental and expensive selling outfit provided by the State, but by recognition and enforcement of the proper relation of product-value to the act of production. Such an adjustment is only possible by opening the eye and baring the arm of the producer, because he alone can handle the foundation stones of fair trade. Numerically, producers stand related to consumers as one to a thousand, perhaps. Thus producers stand, not only fundamentally at the starting point of reform, but because of their smaller number and the essential interest of each of them, they can be most easily and directly organized to secure such reform. If, then, producers can be organized and financially equipped to start their product on its way to consumers, with fair profit above cost of production to themselves, there begins a mastery of the product which will not cease until it finally reaches the consumers' hands. It seems strange that this fundamental economic fact should still be so indistinct in its relation to food production. It has been recognized for generations in its relation to every kind of factory product, and it has been insisted upon and enforced with growing strength from the beginning until now. Every manufacture is organized on this basis except the output of the earth, which is the farmers' factory. And such organization follows its product, after it has fixed its cost of production and profit upon it, until it reaches the consumer. If you buy a suit of clothes from a retailer of good standing in the trade, you can feel the touch of the factory as you draw your purse. If you had communication with the manufacturer you would find that he could tell you what you paid, for he determines the selling price to you. If the retailer charges too little, his supply is cut off for underselling; if he charges too much he is also cut off as a shark who does not

regard the maker's interest in the extension of demand for his goods.

It is this last consideration which shows most clearly the differentiation of the producer's insistent interest and the trader's chance, and emphasizes the mastery of the former in modern distribution of products to consumers. It is essential to the success of the manufacturer that he should make the largest possible output with his profit above cost and a living profit to retailers. It is the farming producer alone who has no mastery. He is still subject to the ancient traders' code to buy as cheaply and sell as high as he can. This makes farming unprofitable, and at the same time robs consumers. It is this old trader's instinct and policy which must be excluded from the traffic in food products.

WEINSTOCK TORPEDOES EXTORTION.

IN OUR notion Governor Johnson was exactly right when he appointed Col. Weinstock to go at the existing situation and condition in distribution of farm products. If Weinstock had frittered away his time and the State's money in such superficial and incidental sports as the shallow law prescribed, he would have been a fit subject for impeachment and for an asylum. On the other hand, he has dealt a heavy blow at extortion by throwing his strength into making clear the reasons for producers' organizations, which are to render production fairly profitable and permanent, to regulate commodity prices by prescribing fair rewards to all distributors whose services are helpful and necessary, and to increase production to the limit, because producers are fairly paid and consumers have money to buy more for better living. He has insisted that consumers and producers shall not be robbed by extortion, speculation, and waste, dictated by greed or contrived by conspiracy, which leave the producer half-paid and the consumer half-fed. These are the essential things to achieve for the development of California as a great producing State. Public markets and direct trade are valuable but incidental, and they will come as people grow to need and provide for them. Such markets must be evolved, not created by legislative fiat. The law should make their creation easy, and should regulate their operation, but localities should provide and equip them progressively as they are used and their value recognized. The most famous public markets of the world are the result of slow growth, sometimes covering centuries. In these more rapid days they may perhaps reach profitable maturity in decades, but not in months. We believe in these public markets in towns. They will come in time, but they are not the first nor the principal thing. Even if there were no other ways of buying and selling in this State, and all California consumers should go to them for supplies, their aggregate business would be a pitiable fraction of the amount or value of the food products of the State. Economic principles involved in fairly profitable production and fairly rewarded distribution must therefore be applied to very different and very much greater requirements than local public markets would minister to.

INADEQUACY OF PUBLIC MARKETS.

WE DO not care to pursue this argument of the inadequacy of local public markets, for we believe in them—to the limit of their capacity, for the small producers and buyers whom they would particularly serve. It is pertinent, however, to note that the State of New York, with a population of about ten millions, has had three committees (appointed by the Governor, by the Legislature, and by the mayor of New York City) acting jointly for two years in a most careful investigation into things needful in the marketing of food supplies, and all agreeing in a joint report. This paragraph from the report is pertinent to our situation, though it comes from a State of vast excess consumption instead of a vast excess production as in our case. Obviously, if public markets were a great recourse, it would appear in a State with such a great buying capacity, but this is their decision:

"A careful investigation shows that city people demand service; that a vast amount of food con-

sumed in the city is ordered by telephone, and delivered at all hours of the day. If all the tillable land available for farming purposes near New York were intensely cultivated, it would produce less than 5 per cent of the foodstuffs consumed by the city.

"We believe, therefore, that before any experiment in retail markets is undertaken on a large scale at public expense, an earnest, intelligent effort should be made to improve our terminal facilities so as to enable the prompt and economical delivery of foodstuffs."

Naturally, as we have excess production near to towns, we might expect better supply of local markets, but what would that avail, except to a limited number of small producers who would use them if they could sell profitably. Beyond that, however, we have surpluses, for the sale of which such markets would count absolutely nothing, and we have a per capita supply of telephones and delivery wagons, and a disposition of people to use them both, far greater in California than in New York. If, therefore, it is irrational for New York "to experiment in retail markets on a large scale at public expense," it is ridiculous for anyone in California to regard them as a solving factor for our great problems of fair marketing. We need greater things just as New York does, though, perhaps, not the same great things.

WEINSTOCK'S WAYS.

NOW, how Mr. Weinstock has proceeded to reach these greater things is a matter of opinion. We hold him to be perfectly justified in his conception of what could be undertaken

under existing laws to reach great ultimate results which the makers of the law probably aimed at but did not hit, and he has secured a wide and valuable approval of his efforts by those who alone have the power to serve the joint interests of themselves and the consumers of their products. There has probably never been undertaken in California a State effort which has been answered by such wide and speedy popular approval, nor one the continuance and extension of which would do more for the relief of both producers and consumers. But, of course, one can differ from Col. Weinstock a good deal in methods without impeaching the principles which he is conscientiously and vigorously serving. We can even claim, on our own part, that our hindsight is better than his foresight, and we now think that we should have proceeded somewhat differently with existing co-operative organizations and with new organizations of the same class. It is, of course, possible that he has proceeded too resolutely by panacean prescription and, not given attention enough to diagnosis of particular cases. More careful diagnosis might have disclosed forms of strength in certain fruit organizations which made operation unnecessary and different remedies helpful—though we hesitate to make the same suggestion in the matter of stale fish. But what does all that matter? Our observation is that crop-producers in all lines are prevalently sure that Col. Weinstock's undertaking has struck a new note in food production and marketing, and they are listening for the fuller ring of it.

of cow manure as a mulch to keep the soil moist and to rot for the increase of humus in the soil. We imagine many San Joaquin experimenters fail because they try to grow a clump of rhubarb like a watermelon plant. Our notion is that you can grow rhubarb all right if you do it right.

Small Hillside Planting.

To the Editor: I have two sidehills with a small stream from a spring running at the foot of them. I wish to plant some cherries, apples, peaches, pears, apricots and plums for a family orchard. I propose to level the land for one row on each sidehill at such a distance above the stream that the roots may get to the water, yet not get too much. How high above the water table do you consider the various kinds should be planted? Will a mixture of the various fruits be detrimental to the best production? One hillside has a slope nearly due west; the other southeasterly. Which hillside do you consider the best for the various varieties of trees, and how far apart should they be planted? How wide a space should be leveled for a row? How far should blackberry, strawberry and raspberry vines be planted from the stream or how high above the water table?—J. W. P., Madera county.

We should not think for a moment of leveling the land, but simply grade it enough to make cultivation comfortable, if it is too steep for that now. If it is now cultivable you only need to grade or even it so that you can carry the irrigation water in ditches from the spring—presumably one on each side; also to fill sags where too much water might collect from irrigation. Of course if you wish to make a swell place you can terrace it, as you are thinking of—say a terrace forty feet wide on each side. The trouble with this might be a cloud burst which would sluice out all your improvements. If it had to deal with the natural surface it might not do any harm, to speak of. Fruit trees grow all right on hillsides, and though they may be more difficult to cultivate and irrigate this would not at all equal the cost of terracing. Especially for a small home orchard we would leave the land largely as it is and the steeper it is the less we should like to disturb it. Anything of four feet or more above the surface of the little stream ought to give you free soil-depth enough. As for the exposure, in a little valley, such as we suppose you describe, opening to the south, there is not enough difference between the two sides to have any perceptible effect on a single row of trees. The trees will not hurt each other. They have grown that way since Eden.

Garden Gone Wrong.

To the Editor: Our garden patch last year was a failure. Considerable fertilizer from barnyard was spread on it, but corn had much fungus on stalks and ears, and all other vegetables were inferior in some way. It was irrigated and cultivated. What does the soil need?—Farm-Garden, Yuba City.

Probably it needs better gardening more than anything else. No one could tell without seeing the plants in their misery just what particular causes were involved. Too much stable manure may have been applied just before planting instead of during the preceding fall or winter. Too much or too little irrigation may have been given, for the plants may have either been swamped or dried out. Cultivation may have been too scant or too coarsely done. The corn may have grown from smutty seed; or because of too much water and too little cultivation, it may have been stricken with mold. The efficiency of any application to the soil depends upon the skill with which the gardening is done. Of course, one cannot tell merely from reading the question what specific mistakes may have been made.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agricultural Weather Bureau at San Francisco, for the week ending at 5 p. m., January 16, 1917.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm

By the Editor || QUERIES AND REPLIES ||

Inquirers Must Give Full Name and Address

Potatoes After Alfalfa.

To the Editor: Can one plant potatoes on ground that has been into alfalfa for three years this spring, or would you recommend some other crop first? The reason for plowing it up, it is a high check and takes irrigation water very slowly. P. T., Escalon.

Potatoes are glad to follow alfalfa. Break up the alfalfa deeply now and clean the land with a disk as growth starts. Plant as early as is safe in your section.

Non-Bearing Plums.

To the Editor: I have very thrifty five-year-old Satsuma plum trees growing on very rich and choice land. The last two years the trees bloomed heavily, but when the blossoms fell off the fruit went also. The stems perish as the blooms dry up so there is little fruit left. Is there any remedy for this? Would an application of nitrate of soda applied at the right time be of any benefit? When and in what quantity should the soda be used, and should it be sown and cultivated as in the case of small grain?—S. W. S., Rivera.

The trouble may be lack of pollination or the rapid growing of a young tree—though the Japanese plums are usually precocious. Keep them under observation longer. The Satsuma is one of the best bearers in your part of the State, and from the behavior of single trees in gardens, etc., it seems to be self-fertile. An experiment with nitrate of soda on part of the orchard might teach you something. Use about 200 lbs. to an acre and see if these trees behave better than the others. As you do not usually have heavy spring rains it can be applied next month in the way you propose. An experiment with spraying a few trees with nitrate, as described on another page of this issue, would also be interesting.

Oak Fungus and Grafting Apricots.

To the Editor: I have 10 acres of 30-year-old Moorpark apricot trees: very large, healthy trees. My neighbor has the same trees and about the same acreage. For the past two years we have been arguing as to whether we should take them out or graft or bud. We each have a small area of oak-root fungus which is constantly spreading. I have decided to take my trees up and he proposes to graft one-half of his to Blenheim. Do you believe such large trees would make good tops when grafted, or, if the trees were sawed off down low and shoots allowed to grow for a year before budding, would they be able to stand up against the winds we have? In your experience how long would it take a grafted or budded

tree to produce a reasonable crop as against a replanted pear tree that would withstand the oak fungus?—R. M., San Jose.

Dig down and examine the root-crowns and main roots of all trees next to those already known to be infested, and include all those found to be diseased in a map of the infested area. If this show that you really have a spot surrounded by healthy trees remove all trees in this spot—burning all roots, etc. Plow this spot as deeply as you can, going slowly and pulling out all roots disclosed. Harrow thoroughly, picking off root pieces, etc., and plant pears on the old spot. Then graft in the branches, above the main forking, all the healthy trees—putting in a good many grafts in each tree and roping or wiring the growths from the scions across through the head next summer to prevent blowing out. Do not cut back for sucker budding. Suckers from a big, low-cut stump have a bad foundation and grow to a big bush, not a well-shaped, strong tree. Your old apricots, well top-grafted, ought to give you two or three good crops before yearling pears planted now will give fruit enough to bother you much.

Rhubarb in Stanislaus.

To the Editor: I have four acres of fine sandy loam of good depth and fertility, seeded to bur clover to be plowed under in the spring. Two acres of this I intend to plant to black- and raspberries, being lighter soil than the rest, and the balance I was intending to plant to Giant Crimson Winter Rhubarb, giving the ground a heavy coat of manure. But I am told that rhubarb has always proved a failure in Stanislaus county, owing to the long, dry summer. I have thought of assisting atmospheric humidity by growing some inter-crops, such as Indian corn, between the rows of rhubarb for shade the first year. What is your opinion?—O. B., Empire.

Rhubarb certainly likes partial shade, even nearer the coast, where the sun is cooler and the air moister. A more permanent sun shade like a row of deciduous fruit trees would be better than corn, but if you get a tall corn and plant rather late it may hold a fair shade late enough, with irrigation to keep it going. But quite as much as shade, rhubarb needs adequate and continual soil moisture to make good strong roots to stand leaf-pulling the next year and continuous good summer-growing conditions after that for the next pulling and so on. It also likes a good deal

What Fruit Tree Planters Should Know.

VARIETIES, ROOTS, AND SOIL CONDITIONS SUITABLE FOR CALIFORNIA FRUITS; POINTERS ON SELECTING TREES, HEELING THEM IN, PLANTING, PRUNING, AND PROTECTING THEM DURING THE FIRST FEW MONTHS.

[Furnished Pacific Rural Press by John Vallance, Oakland.]

Tree planting is now with us. January and February are considered the best months for California, although lots of planting is done late in December and during March with perfect success. Many new home-seekers are coming to our State and many have bought ten, fifteen, twenty, and forty acre tracts. It is for these that this paper is intended. The ways of transplanting and caring for young orchards differ very much from the way it is done in their home place. Perhaps, in fact, many of the trees are unknown to them. For instance the apricot, the almond, the fig, the olive, are trees they may have read about, or eaten of the fruit, but of their growing and pruning they know nothing. Well then, our first note of warning is, be sure you have got hold of the right kind of land; be very careful before you put a deposit up. See that the soil has no hardpan close to the surface. See that there is no rock or alkali, and no standing water in winter.

Now, what to plant is the next question. The best way to find this out is by careful inquiry and observation.

If Apples are preferred, the following are among the best sorts: Gravenstein, Esopus-Spitzenberg, Jonathan, Smith's Cider, White Winter Pearmain, Yellow Bellflower Yellow Newtown Pippin, Rome Beauty, Red Astrachan and Alexander. The variety or varieties to plant will be according to your section, and this matter will also have to be investigated.

Among Pears the Bartlett will be found perhaps the best. It is the best for canning. It is good for Eastern shipment, good for drying, and good for home consumption. For late shipping sorts the following: P. Barry, Winter Nellis, Eastern Beurre, Duchess d'Angouleme. For mid-season shipments the Beurre Hardy and Beurre Clairgeau are good. The pear will thrive very well on wet land.

Cherries.—The following are among the best: Black Tartarian, Napoleon Bigarreau, Lewelling, Bing, Rockport Bigarreau, and Lambert. The cherry, to have the best results, must have a deep soil with perfect drainage.

Prune Growing in California, is one of our greatest industries, and the best variety is undoubtedly the French (Petite d'Agén). The Imperial Prune is also quite heavily planted, but does not succeed so universally as does the French. These two sorts are used altogether for drying. The Sugar Prune is a large, lovely sweet prune which is used for Eastern shipments, as well as for drying, and the Tragedy is a prime favorite for early Eastern shipments. The Hungarian, a large red prune, is extensively used for shipping; it is good for eating and excellent for preserves. The prune tree can be grown on a diversity of soils, as nurserymen grow it on the following roots: Myrobalan for wet

soils only; almond root where moisture is far from the surface, and peach root for loamy, well-drained soils.

Plums are planted extensively for Eastern shipments and home consumption, and the following are the sorts that are grown for this purpose: Burbank, Climax, Clyman, Kelsey, Wickson, Santa Rosa, Formosa. For canning purposes the following are preferable: Jefferson, Washington, and Yellow Egg. Plums can also be obtained grown on the Myrobalan, peach, and almond root.

Apricots are one of California's staple crops. No other State in the Union can grow this so well nor so profitably. The Blenheim, Royal, Tilton, and Hemskirk are the best, and about in the order named. The apricot is grown on the following roots: Myrobalan for wet land; peach and apricot root used according to soil conditions.

Peaches.—The acreage of peaches in the State is enormous, and the following are some of the best early sorts (mostly planted for early shipments). All are freestones: Alexander, Briggs May, Hale's Early, and Triumph. For midseason: Early Crawford, Foster, Elberta, Lovell, and Muir. For drying, the Lovell and Muir are the main varieties. Clingstones are used altogether by canners: Tuscan Cling, Phillips Cling, Orange, and McDevitts. The Salway is perhaps the best late freestone and is used for home consumption and canning. The peach is grown entirely on the peach root and therefore your soil must be sedimentary, well-drained, and with plenty of depth.

The Nectarine, we believe, is not grown to any large extent as yet, although it thrives to perfection in this country.

In Almonds California is the leader, producing 80 per cent, I think, of the crop of the United States, and yet only 25 per cent of the entire consumption. The following are the most extensively planted: Nonpareil, Ne Plus Ultra, I. X. L., Peerless, Texas Prolific, and Drake's Seedling. The almond is grown on the almond and peach root, the former for soils where water is far from the surface, and the latter for deep soil that has good drainage and is well moistened.

The Walnut is a valuable crop in this State, and the following are among the best producers: Franquette, Mayette, Concord, Placentia, and Santa Barbara Soft Shell. Up to a few years ago these were grown on their own roots, but now most walnut planters prefer those trees grafted on the California black root.

The Olive is at home in this State, and in this State only, and produces heavy crops. The Mission olive ranks about the best, then follows the Manzanillo. These are both excellent for oil and pickles, green and ripe. The latter method of pickling is a purely California idea, which is meeting general favor. There are other sorts for pickling only, such as Ascolano and Sevillano, known

as the Queen Olive, that are in great demand.

The Fig is grown in this State very extensively; and the White Adriatic, Mission, and San Pedro are among the best for eating green, and the Calimyrna for drying. To insure a crop from the latter variety the Wild or Capri Fig must be planted in the same orchard. From this variety the Blastophaga, a fly, issues and carries the pollen from the Capri to the Calimyrna flowers and fertilizes them.

Age and Size of Tree.—The next question that will arise in the new-comer's mind is what age and size of the tree should he get, and we will answer this by saying that the best tree is what nurserymen call "one year old." The root is one year older, so this practically makes the tree two years old. It should be either three to four or four to six feet high.

The Pruning of the Young Tree is the next question. All broken roots should be pruned off, and where the root is straggly, prune off a little. Pruning the top requires attention. This should be done after you have all your trees planted. All trees must be headed back 2½ to 3½ feet from the ground. Apples, pears, apricots, prunes, and plums should

be cut back to a "whip," that is, all laterals should be cut off. These varieties will break away at any of the eyes on the main stem, but with a peach and almond tree it is different. Many of the eyes on the main stem of these trees are "blind," so two, or perhaps three, of the laterals must be left on, and these headed back to two or three eyes. A great many failures to grow are due to pruning these two sorts to "whips."

Protect the Roots.—Should the weather be clear and warm, during the time you are planting, you must keep the roots protected as much as possible. Many trees receive permanent injury at this time by failing to observe this rule. I have known of men who lay out the trees before the planters are ready, and they will lie out for perhaps one or two hours in the drying wind and hot sun. Never do this. If the weather is cloudy and no wind then you do not need to use so much care. A good way is to rig up a wagon with a barrel of water and keep the trees immersed in it till used. How large a hole should be dug for the roots? In sedimentary land the hole does not require to be so very large,—one and a half feet square. In heavier soils two feet will be better. Be careful that you use the finest soil around the roots. If no rain should come within a rea-

sonable time, then two buckets* of water should be given each tree to settle the soil. This is not usually necessary as we have rain to do this, but the last two seasons have been exceptions. Plant the tree a little deeper than it stood in the nursery rows.

Shall I Fertilize My Trees? is a question often asked. The answer is, "No, it is not necessary."

Protection from Sunburn.—The trunks of all young trees must be protected from the summer suns. This need not be done, however, until April. There are several kinds of tree protectors, some made from tulle, yucca, or wood, or a newspaper wrapped around the tree as far up as, say, two to two and a half feet, makes excellent protection from sunburn. Many planters whitewash the trunks of the trees instead of using tree protectors.

Dynamiting.—Much attention is being given of late to this method of preparing the holes for planting, and where the soil is heavy adobe or hardpan near the surface, it is a very good thing to do, but where the soil is loose and open dynamiting is not necessary.

First Few Months.—When young trees throw out growth from below the desired height at which you wish them to branch, these must be brushed off by running the hand down the stem, or if they are too large to do this, a knife must be used.

During the early period of their growth you will have to look out for insects. The cut-worm, for instance,

we would warn you against. They work at night and lodge in the soil at the foot of the tree in the daytime. Go over your trees early in the morning and you will catch many of them.

Nurserymen mostly pack their trees in tulle. This makes a good material for this purpose. Upon receipt of your trees notify your Horticultural Inspector of their arrival and get his permission to haul them home, and have him examine the trees there, and not at the depot, because when the bale is once opened it can never be put up the same again, and that is where the trees will receive injury by drying out. Then after inspection is through, commence to "heel" them in. They are tied in bunches of 10 or 20. Cut the lower rope around the bundles and spread out the roots, leaving the top string around the branches. Work the soil carefully around the roots, and if there is no rain, water them very thoroughly, as it may be days before you get them all planted. Many trees receive injury at this time by poor "heeling" in.

If your trees do not all grow, do not blame the nurseryman. Remember he can only guarantee to furnish you good healthy trees. He cannot guarantee them to grow, as so many things may happen over which he has no control. Look out for gophers and squirrels, and remember that cultivation and plenty of it, is as essential as water. Rather give me cultivation without irrigation, than irrigation without cultivation. The soil must be kept aerated.

Plants Nuts in Orchard Form.

[Written for Pacific Rural Press.]

To growers who may be in doubt about which variety of walnuts is freest from blight, but do not want to lose time in getting the trees started, E. I. Hutchinson of Contra Costa county suggests planting black walnuts now, to be grafted above the forks at five or six years old. By that time much more will be known about blight; and you will know better which is the best commercial variety for your conditions.

Mr. Hutchinson keeps the black nuts moist from the time they fall. He plants them in a moist sand bed in mid-winter. When they have sprouted so he knows they will be vigorous growers, he thinks it well to plant carefully in orchard form three or four inches deep with the sprout downward because this is the root. Three or four strong nuts

should be placed four to six inches apart where each tree is to stand. There will probably be one stronger than the rest, and later it will be selected. Spring rains will follow planting; and water should be given the first year, but be careful not to drown the seedlings.

Mr. Hutchinson says that trees planted that way 20 years ago are his very best trees. Transplanting may, he says, result in poor root systems unless the requisite amount of care is used.

It is noteworthy, however, that most of the walnut plantings in the State are of nursery rooted trees; and if the nursery work is properly done, the better stand, the quicker bearing, and the exclusive use of the land two years more for other crops, makes this system preferable for most people.

Mendocino Grower's Experience

[Written for Pacific Rural Press.]

In relating his experience with spraying for curl leaf of peaches and peach twig borer, A. P. Nelson of Calpella, Mendocino county, writes as follows: For curl leaf on peach and peach twig borer I used 33 pounds of quicklime, 33 pounds of best sulphur, 5 pounds of salt, and boiled it for about an hour so that every trace of sulphur was lost. After boiling I added enough water so as to make 200 gallons mixture, and used a pressure from 100 to 200 pounds on spraying machine. I had the local horticultural inspector, Mr. Van Dyke, look at my peaches, and he stated that they were absolutely

free from any disease. This fall I sprayed again as follows: 110 pounds of sulphur, 80 pounds of stone lime, heated to a boiling point, then boil for 45 minutes, and add enough water to make 500 gallons of mixture. This spray is a winter spray.

Regarding apples and pears, I sprayed three times, using 8 pounds arsenate of lead to 200 gallons of water. Spray first when blossoms drop and then twice every six weeks. I obtained excellent results, and my fruit was practically free from worms. I have a large quantity of apples now stored absolutely free from worms.

TALKS ON Nitrogenous Fertilization

Number 7

WHAT is the best way to apply Sulphate of Ammonia?

Generally speaking, it may be spread the same as you would any other fertilizer material. It is sufficiently dry to apply easily and evenly by hand or machine, though for the last mentioned purpose it works better when mixed with an equal bulk of dry sand or earth.

SULPHATE OF AMMONIA

For CITRUS GROVES a good way is to dump several sacks of Sulphate into a tight wagon-box and drive slowly along the rows, spreading on either side with containers that hold just what each tree is to receive—say, 1 to 3 pounds at each application.

On TRUCK CROPS it may be spread broadcast before planting or before the plants are set out.

For FIELD CROPS apply broadcast by hand or machine at time of planting or before.

From 100 to 300 pounds per acre will be found profitable.

The Real Live Fig Institute.

Attendance heavy, interest intense, discussions the best ever, and the latest knowledge of fig culture, troubles, and marketing given out. Similar programs might well be provided for State Conventions.

The "Fig Institute" held at Fresno, Jan. 12 and 13, was considerably better attended, and produced considerably more floor discussion by growers, than any of the recent California Fruit Growers' conventions. During the three sessions of the first day there was a total attendance of perhaps 1100 or 1200. The only man who held the floor any length of time was Dean Thos. F. Hunt in the evening, and no one would have had him stop sooner. All addresses except his were strictly fig. The Dean showed, among other things, that there is a very definite relation between the amount of capital invested, the expenses, gross returns, and the labor income from a ranch owned by its operator. He also showed that the renter must and does operate more land than the farmer who works his own land.

From the beginning, the discussions were ably led, in that the leaders drew out expressions from experienced growers all over the house in answer to questions which came as freely. The program was full of interest from the start.

The demonstrations which were to take place in the afternoon at Geo. Roeding's orchard, showing methods of pruning and planting nursery trees, pruning and topworking bearing trees of different varieties, etc., were prevented by rain, and the growers held informal but long-continued discussion in the auditorium which the Fresno High School placed at the disposal of the "Institute."

Fig Troubles.—The limited knowledge regarding control measures for fig troubles was quite thoroughly shown. Split figs were ascribed to every abnormal condition suggestable, but the discussion seemed to show that the most likely and usual cause is irregular water supply—neglect for a while and then irrigation. As A. E. Beers, Merced County Horticultural Commissioner, pointed out, there is a very notable variation in most of the characteristics of fruit from trees of the same variety, and G. P. Rixford has been testing out the possibility of getting trees whose figs won't split, by propagating cuttings from such trees on the Vina ranch for the past three years. These four trees do not have split fruit while those around them often do.

Soured figs were scored as a menace to the markets for the industry; but none told the cause with any confidence. The sweeter varieties sour more than the black or

the Kadota. The latter is a new one with tougher skin and self-sealed aperture. Control of smut in figs was admitted to be an unknown quantity.

Nematodes on the roots, however, are not so hopelessly superior to control, though they are the greatest destroyers of fig trees. They attack new rootlets principally, and older roots, too, causing knots on them. Adriatics are especially susceptible, due to their shallow rooting. The nematodes are worst in sandy soil and within two feet of the surface, though Henry Markarian said he had found a few six feet down. Mr. Markarian seemed to have the best-proved means of control. He has saved infested trees by applying as much as five tons of hydrated lime per acre and flooding it for several days. Until four years ago he dug out an average of eight trees per year, the other trees did poorly. Since then he has not dug out any and the crops have increased. One tree never produced more than a few figs until he limed and flooded it in a check reaching out as far as the branches. Six inches of water was left on for six days. After it had dried off, the check was flooded six days more, and he got 200 pounds of figs from that tree last year. The afternoon discussion seemed to show that his results were due to the flooding rather than liming, for nematodes have been seen having great sport in saturated lime water for a short time, but the evidence seems to show that they need air.

Varieties to Plant.—The discussion of varieties was warmest. R. M. Roberts of the Santa Fe has observed so many failures with Calimyrnas by new settlers, due to the need of caprification, that he recommends Adriatics, not only for their capacity to stand abuse and bear fruit bravely on, but also because the demand for them is increasing. He admitted the superior flavor of Calimyrnas, but not the latter's extra sugar content until Prof. W. T. Clarke and Henry Markarian had mentioned University analyses proving it. Mr. Markarian talked for the Smyrna because it is the best fig, and maintained that the only extra cost of growing them was the caprification at about \$1 per acre besides the care of capri trees. The discussion showed that most California figs are grown as borders to vineyards, etc., and that the trees are outrageously neglected. Under these conditions, even Mr. Markarian admitted Adriatics to be best. For

MORE ABOUT DATTIER DE BEYROUT.

To the Editor: I have some Dattier de Beyrouth grafted on Zinfandel, which bear well, but too many small berries intermixed in the bunches. I stake and prune them like Malagas. Is there any known way to increase the size of the berries? The bunches are large enough. —P., Dinuba.

[Answered by Frank Henry, Fresno.]

The fault is not in the Dattier de Beyrouth grape in having seedless and stringy bunches or small berries, but in the way they are cared for. The vines are made too strong in growth before and at blossom season, for proper fertilizing at blooming time. If your Dinuba correspondent will let his ground dry out, and vines stop growing at blooming time, the grapes will be of a very uniform size. Be sure and don't prune too short.

Works Like 6 Horses

The Powerful Little BEAN TrackPULL
6-Horse Tractor Does the Work of 3 Teams
at One-third the Cost, and Does It Better.

Hundreds of farmers, orchardists, vineyard and citrus grove workers, have chosen this new way in plowing, cultivating, and all kinds of stationary work, and are saving money every day. The BEAN TrackPULL Tractor is cutting the cost of operating in all agricultural lines. It is a powerful, economical, and a rapid worker. It does the work of six horses at the cost of keeping two, and will keep on doing it day and night if you say so.

The BEAN TrackPULL is the only track-laying tractor that sells

for less than \$1800. There is no other like it. It is fully patented. Weighs only 2800 pounds,—so light that it works over the softest, loosest soil without packing it. Gets into corners like a team, and turns completely around in a 10-foot circle. In the vineyard the BEAN TrackPULL Tractor will plow within an inch of the vines without breaking off the young shoots. In the orchard or citrus grove it will go closer to your trees than your horses can go, working under tree boughs only four feet off the ground.

BEAN TrackPULL Six Horse Tractor

Here is a tractor that will pay for itself. The BEAN TrackPULL Tractor, unlike horses, causes not a penny of expense when it is not working, and is a light eater when at work. It furnishes ready, powerful, untiring traction for all uses whenever you need it. The price is \$950 cash, or it can be bought on easy payment terms, if desired—the lowest-priced tractor in the world considering what it will do. Our factory is now working to capacity, and tractors are being shipped out as fast as they are finished and fully tested. At this rate buyers who come late will have to put up with a delay. You can reserve a tractor now, and then decide later

about ordering it. No obligation involved.

We are the makers of the famous Bean Sprayers, and the Tractor is as good as the sprayer.

Find Out Now

Mail us a postal today. Just say, "Tell me more about the BEAN TrackPULL Tractor." A big circular with full description, specifications and prices will reach you by return mail, and if you want us to we will arrange to reserve a tractor for you until you decide. Do this now. We will give you name of nearest dealer who can demonstrate.

orchards of not much less than 20 acres, however, where a man will take care of his trees, he would recommend nothing but Calimyrnas. There are 25 days in June when caprification takes place, and he believed that anyone wanting to grow the best figs would have no trouble learning the details of that process. The Black Mission fig received scant attention on account of its low market value and low sugar content. The Kadota fig stirred up live discussion on the second day, as it is warmly supported by a few on account of its tough skin, self-sealing of the aperture so that it does not sour, lack of splitting, and other good points which were claimed to overbalance its inferior quality. Some maintained that as a shipping or drying fig, it could not compete with the other varieties. Prof. J. Eliot Coit pointed out that only with Calimyrnas can we drive out foreign figs from American markets.

Planting Cuttings.—Owing to the impossibility of getting rooted fig trees for desired planting this spring, the subject of cuttings stirred up live discussion. Whether to plant cuttings in orchard form was the question. Many growers told their experiences, and the final impression gained by the writer was that if cuttings planted orchard form receive as much individual care, and especially with regard to moisture, as they would in a nursery, they would make as good trees at the end of the second year as if grown in nursery with care and transplanted at one year old. The small likelihood of their getting enough attention if planted orchard form, and the obstruction to use of that land for other purposes, seemed to establish the desirability of rooting cuttings first in nursery.

Details of climatic and soil requirements, planting, pruning, fertilization, protection from sunburn, irrigation, etc., were well discussed, as also preserving, packing, and shipping. Capri varieties and caprification were presented in a paper from which extracts are printed elsewhere. The California industry was portrayed in colors by stereopticon in the evening, with Prof. I. J. Condit to discuss the pictures.

The great success of this Institute for one fruit industry suggests the desirability of having our California Fruit Growers' Convention programs arranged to complete the discussion of each fruit on a certain day, and to insist on most of the time being appropriated exclusively to discussion of problems by the growers attending the meetings.

At the Saturday session the convention adopted by unanimous vote a resolution to organize a co-operative fig-growers' association along the same lines as the California Associated Raisin Company and the Peach Growers' Association, both having headquarters in Fresno. Warren T. Clark of the University of California, chairman of the convention at Fresno, was authorized to appoint a committee of one man from each fig-growing county in the State. This committee is given the authority to outline all details for the co-operative organization.

The Fallbrook Citrus Ass'n are building a \$5000 orange and lemon packing plant, the first plant of its kind ever erected there.

SUMMER ORCHARD COVER CROP IN ALTERNATE ROWS.

[Written for Pacific Rural Press.]

"I don't plant cover crops," writes Gerald Geraldson of Placer county. "I just allow alternate rows of each year's output of natural grass (and bur clover) to mature and plow it in next spring. I irrigate four or five times per year, formerly 10 to 12 times.

"The condition of the land is vastly improved, and the growth of the trees and quality of the fruit much better. Have had no aphids whatever."

C. V. Freed, who practices the same system, reports that the thrips

in his orchard are no worse than in other orchards where no cover crops are left in summer.

THORNLESS BLACKBERRY.

To the Editor: Where can I get Cory's Thornless Blackberry?—L. M. G., Santa Rosa.

The Ekstein Nursery Co. has bought the entire stock of these plants. Their announcement has appeared in Pacific Rural Press advertising columns. We would invite the numerous people who have asked us where to get it, to look over our advertising columns as regularly as the paper comes, for you will there find some of the most valuable news in the paper. But if you prefer an-

swers to questions not of general interest, be sure to enclose postage for reply.

APRICOT TREES SUNBURNED AFTER HEADING BACK.

[Written for Pacific Rural Press.]

Apricot trees do not show sunburn so readily as peaches, cherries, etc., but last winter we saw an old orchard in Riverside county which had been renewed by cutting off the tops five or six feet high five or six years ago. The main limbs are sunburned on the southwest side, and badly rotted—too bad to handicap the fine new tops on these trees with such useless injury to the bark which should be carrying sap.

Olive TREES

—with roots like these will give good results.

In planting Olives, as with any other fruit, it makes a wonderful difference in future profits if you start with trees that are straight, thrifty, well branched, and true to name.

Note the root system. This is a fair sample of Roeding's True Olive Trees.

Roeding's Trees Please

Our nurseries have been more closely associated with the growing of the Olive than possibly any other concern in the state. We are therefore in a position not only to supply you with the finest stock but to properly advise you as to varieties, planting, pruning, etc., and this we will gladly do free of charge.

Olives Make Excellent Border and Avenue Trees

—and they bear heavy and profitable crops. Orange orchards bordered with olives get good protection and in addition you get good returns from the olive trees. There is a wonderful future for the olive industry in California and if you start with the right trees there should be no question about profits.

Plant Manzanillo

The Los Angeles Olive Growers' Association, in a recent letter, advise the planting of Manzanillo olives, stating that the results received from that variety exceed those from any other. As the fruit ripens earlier than other varieties, there is little danger of frost. It makes an excellent pickle and is a regular and prolific bearer.

We Have a Fine Stock of All Kinds of Fruit Trees and Vines

We can supply you with almost anything you may wish to set out. Send us your list for prices and suggestions.

New Illustrated Price Catalogue Now Ready

If you haven't already received a copy of our 1917 catalog it will pay you to send for a copy today. Do it now.

Ornamental Trees
Plants, Shrubs, and Roses

WE have long been noted for the superior quality of our ornamental stock. Our hardy field-grown roses are wonderful bloomers. We have a splendid stock of palms, climbing and trailing vines, border plants, etc.

Nitrate of Soda Spray for Fruit Bearing

[Written for Pacific Rural Press by W. H. Volek, Hort. Com., Santa Cruz Co.]

The practice of spraying dormant trees with nitrate of soda or other nitrate solutions is attracting considerable attention at the present time and a brief discussion of this matter should be of interest to the fruit growers. Nitrate of soda spraying is giving excellent results with apples and pears. Trees so sprayed are improved in vigor and fruitfulness, provided the application is properly timed. There appears to be a general misinformation regarding the time of application. To obtain the best results nitrate sprays must be applied while the trees are thoroughly dormant, and the month of January is the ideal time under California conditions. Later applications will not only be less effective, but may also be decidedly injurious to the expanding fruit buds.

Nitrate of soda is not much of an insecticide or fungicide so to overcome this defect it is best to apply it in a mixture with some standard insecticide such as lime-sulphur solution or caustic soda.

Formula A.

Nitrate of soda 100 to 200 pounds
Lime-sulfur solution 20 to 25 gallons
Water to make 200 gallons

Mix these materials together in the spray outfit tank for several minutes or until all the nitrate is dissolved. The mixture is then ready to apply.

Formula B.

Nitrate of soda 100 to 200 pounds
Caustic soda (lye) 25 to 35 pounds
Water to make 200 gallons

Mix as directed above.

The nitrate of soda may be in large lumps. These should be broken up with a hammer, and care should be taken to get as little sacking lint into the spray tank as possible. This lint tends to clog the strainer so causing much trouble. In some cases it is necessary to dissolve the nitrate separately and strain it to remove this lint. The application of nitrate sprays is similar to other spraying in that great thoroughness is necessary to obtain the best results. Results are also subject to weather conditions, for if a rain follows too soon after the application the nitrate solution will not have time to penetrate the bark.

Our experiments have determined that nitrates applied as a spray to apple and pear trees are, under the proper weather conditions, much more effective than the same quantity of material applied to the ground. We have not obtained such marked results with stone fruits, but believe that the proper conditions have not obtained in most of these experiments. Rains have been almost constant during January, a fact which probably accounts for most of the poor results. At any rate the application of nitrate sprays to stone fruits deserves some attention on the part of growers who may have an opportunity to try it under varying conditions. From our past experience it appears that nitrate spraying will be most successful during dry years, while it may be almost a failure when applied in an excessively rainy season.

The matter of dilution is one which depends considerably on circumstances. Our experience has been that nitrate of soda used at

the rate of one pound to the gallon is most effective the first year, but equally good results are obtained with one-half pound the second year. The kind of spraying, also, has much to do with fixing the optimum concentration for the weaker solution applied thoroughly may be more effective than the stronger applied indifferently. In cases where a good job of spraying is not certain, owing to indifferent or inexperienced help or for any other reason, it would certainly be best to use the stronger solution.

Lastly, we have not observed any injurious effects from the application of the strongest possible solutions of nitrate of soda to dormant trees. The same is true for the continued use of nitrate of soda on the same trees for several years. Nitrate solutions do injure fruit buds after they have started to expand, but no

injury to the tree has ever been observed to result from such applications.

REMOVE LITTLE-LEAFED PEACH.

[Written for Pacific Rural Press.]

Little-leaf peach trees can be remedied only by complete removal and replanting with new stock, according to G. H. Drew of Fresno county. It is also a question whether replanting will produce good trees. He has carefully pruned and cared for several such trees on his orchard for five or six years, and has noticed that they were inclined toward little-leaf from the start. They put out excessive sucker growth but little fruit wood.

WORKING OVER OLD ORANGE TREES.

To the Editor: When is the proper time to graft old orange trees? What month does the 'sap go up'?—J. L. C., Snelling.

Sap is going up all the time, but with especial force when you see the new yellowish green shoots. Grafting of oranges is almost out of date. Cut off several but not all of the branches now while trees are dormant and weather cool, whitewash the trunks and main limbs, and graft now if you must graft. Budding may be done in spring in old bark, without removing so much of the top, using older buds; or you may cut back severely now, allow shoots to grow in spring and bud into the strongest of them when they are big enough to bud.

Citrus experts in the Pomona district, who have investigated the situation, are of the opinion that the grower who does not keep his trees pruned loses from \$20.00 to \$50.00 per acre each year on account of this negligence. The tree that is filled with dead limbs and branches is a sick tree. It does not produce much fruit on the inside of the tree because the dead wood chokes it out.

Don't Fail to Plant Some Ascolano OLIVE TREES

Your Olive orchard should contain at least one-third Ascolano trees. This variety is the largest and best pickling Olive grown; one of the earliest to ripen. On account of its large size, attractive appearance and superior quality, demands the highest market price.

Our Trees are of the Largest and Best "Strain" of Ascolanos.

—producing extra large fruit of highest quality;
—and by our method of propagating and growing Olive trees, the BEST obtainable are produced: Straight, clean, thrifty, well-rooted stock;—also, by our system of digging, packing and shipping, they reach the planter in best of condition.

Can supply in any quantity.
Prices on application.

Can also supply high-grade Mission and Manzanillo Olive trees in all sizes and any quantity at—right prices. WRITE NOW,—TODAY, stating your wants.

Spring Canker Worms.

[Written for Pacific Rural Press.]

In the spring you may find "loop worms" on your apple, prune, apricot, cherry, pear, or plum trees eat the first of March, the females emerge from their tough, grayish brown cocoons which have been just under the surface of the ground all winter.

The first business of the females is to climb a tree (for they have no wings) and to lay their eggs, often in bunches, in protected places under rough bark, etc., on the trees. The hungry youngsters hatch just in time to eat into the young leaves, sometimes being numerous enough to defoliate the tree. When they get tired of eating, they drop to the ground and pupate until the following spring.

To keep the eggs and young where you can give them an effective soap wash of one pound soap dissolved in five gallons of water, apply a thick band of tree-tanglefoot a couple of inches wide just below the head of the tree or fasten sticky

bands around the trunk so they cannot crawl through under them, or trap the worms with a wire screen as many growers do, including M. Sharpe of Solano county. He shaves a strip of bark a few inches wide around the tree smooth, but not any deeper than necessary, puts a strip of cotton over the shaved strip, and fastens a strip of wire screen tightly over this with its lower edge flared away from the trunk. Worms cannot crawl under and past the screen on account of the smoothed bark and cotton. But in some seasons they crawl under the screen by the hundreds ready for slaughter.

Plowing and cultivation before they emerge from the cocoons injures large numbers of them so they do not survive. If they get onto the tree and begin eating leaves, arsenate of lead paste four pounds per 100 gallons of water or arsenate of lead powder two or three pounds per 100 gallons, should be sprayed once or twice on the leaves as they develop.

Citrus Irrigation.

[Written for Pacific Rural Press.]

"One thing I've learned in irrigating orange trees," says C. A. Davidson of Tulare county, "is that a row 32 trees long is too far to run the water, especially if the surface is nearly level. Trees farthest from the flume look far better if they receive enough water, than those next to the flume. The latter are over-soaked and turn yellow.

"Another point is that in heavy ground, if the water gets next to the tree trunks, it bakes and when it cracks it squeezes so hard against the bark that sap is stopped and

sours from the ground up.

"With a bunch of such trees, discolored and soured on the trunks, Mr. Davidson had good luck by cutting slits in the bark as wide as his finger from three inches below ground to three inches above the discolored area. This let the gum out, loosened the soil, and the trees healed without further treatment. With lemons, and less necessarily with oranges, such wounds should be painted with Bordeaux paste and the soil kept away from them, to avoid infection with real gummosis.

BLACKENED SPOTS ON PEAR LEAVES.

The pear leaf blister mite is a very common pest in many districts. It causes the leaves to blacken in spots where the mite is present. These blackened spots represent galls or swellings of the leaf tissue in the center of which the mite resides. When first forming, these galls are blister-like and reddish in color. While mainly abundant on pear, the blister mite also may attack the apple, in which case the galls are brown in color. During the summer time the mites live entirely in the blisters, producing eggs and young therein. At the approach of cold weather the mites migrate to the bark of the tree, hiding themselves in rough bark around buds and twigs.

According to Dr. A. L. Melander, entomologist of the Washington Experiment Station at Pullman, the best control measure seems to be a spraying of sulphur-lime given in early spring, when the buds are swelling. After the mites have entered the leaf tissue they can not be exterminated, although spraying with colloidal sulphur is claimed to afford some relief. This finely divided sulphur keeps the mites from spreading, especially to the fruit. In case of bad infestation the fruit is scarred with similar blisters.

Sixty-six applications to purchase State land, involving 20,770.42

After a citrus tree is four years old, it doesn't pay to intercrop according to L. G. Duval of Ventura county and Mr. Carroll of Orange county,

among others. Cultivation and irrigation of the intercrop interferes with proper operation of the citrus crop.

FRUIT TREES THAT PRODUCE RESULTS

Fine, strong, healthy, hardy, well-rooted trees—that's the kind you get when you buy from "the Nursery that helped to make Santa Clara County famous."

Our budding and grafting are all done by experienced nurserymen, and our scions are always selected from trees that have a known record for productiveness. Plant Elmer trees and your orchard will be a big profit-maker.

Write for our price list and quotations on any kind of stock.

Foot-hill grown trees are immune from crown-gall and root-knot

Roots such as are grown only on our foothill soil and location. THEY ARE TREE INSURANCE

We Insure You Trees Free From Disease

Don't gamble on the future of your orchard.

Don't risk the loss of several years of your time and the waste of your money by getting nursery stock that may be infected with crown-gall or root-knot.

IF YOU BUY OUR FOOTHILL GROWN TREES

they will come to you clean. The foothill lands on which we grow our trees are immune from crown-gall, root-knot and diseases common to other localities.

Our trees are propagated from the best parent trees of their kind. They have those well-branched fibrous roots, such as are grown only on our foothill soil and location. These roots are tree insurance—hardy trees—heavy producers of good fruit—profit makers.

For years we have grown nursery stock and have successfully operated 1000 acres of commercial orchard. All our experience in fruit growing and shipping is at your disposal.

If you are in doubt as to what trees to plant—if you are having trouble in your orchard—or have orchard problems—write Bergtholdt.

Our foothill grown trees are in great demand. Many varieties are selling out fast.

If you want disease-free, foothill-grown Pedigreed trees, send us immediately a list of your wants for special quotations.

Wine Men Cut Loose from Saloons.

More than one hundred members of the California Grape Protective Association held a meeting in San Francisco on January 11. A statement to the public was adopted with only two negative votes, as follows:

This association is not wedded to the American saloon. It never has been. It believes the evils of the present system could be practically exterminated if the people would awaken from their provincialism and follow the example of continental Europe. In the cafes and gardens of Germany, France, Italy, Spain, etc., where men and women, priest, rabbi and minister, congregate to sip light wines and beers and to while away a few hours in pleasant converse, drunkenness is unknown, and even occasional intoxication is extremely uncommon.

In those countries the evils of the liquor traffic, as we knew them, are non-existent, and the drink problem has been solved by the custom of the people—a custom no fair-minded friend of temperance over there would change and the beneficial results of which are patent to any intelligent and unbiased observer.

Resolutions Adopted.—Tracy Learner of Gilroy introduced a resolution, summing up the position of the grape growers, which was passed. The text of the resolution follows:

Whereas, the grape and wine industries of California are desirable and legitimate industries, fostered and encouraged by the State and nation; and,

Whereas, we believe the only way to enjoy and derive benefit from wine is to use it at the table with meals, whether in the home, the hotel, the restaurant, the cafe, or the club; and,

Whereas, the people of California, by their vote on November 7, 1916, showed conclusively that they were against complete prohibition and the annihilation of the grape and wine industries, but in favor of abolishing the saloon as it is conducted today; therefore, be it

Resolved, that the California Grape Protective Association is strongly in favor of drastic steps to clean up all places where spirituous, vinous and malt liquors are sold to be drunk upon the premises, and that if this cannot be promptly accomplished, that we will get behind any movement that will abolish them forever.

Officers Elected.—Frank Swett of Martinez was elected president; H. F. Stoll of San Francisco was re-elected secretary; Louis Wetmore of San Francisco, George R. Belcher of Pomona, C. J. Wetmore of San Francisco, James Madison of Fresno, and J. T. Langford of Acampo, directors. Fifteen more directors will be chosen by various associations throughout the State, and these will select three vice-presidents and a treasurer.

SPRAY FOR PEACH LEAF CURL AND WORMS.

To the Editor: Which would you advise as the best spring spray for curl leaf and peach moth—Bordeaux or lime-sulphur? My Elbertas were badly curled last spring, and some on the Phillips Clings. Which is the best nozzle to use, Bordeaux or vermorel?—J. M., May.

Bordeaux will not affect peach moth; so lime-sulphur is preferred; for it will get both curl leaf and peach moth if properly applied as the buds are swelling. Bordeaux type nozzles give the most force and are preferred except for spraying trees in full leaf, when a fog spray, such as the evermorel type produces best, is more likely to reach all surfaces.

H. P. D. Kingsbury of Redlands, manager of the Citrus By-Products Company, reports the receipt of an order from the Merrill Soule Company of Syracuse, New York, for 30,000 pounds of orange peel. It is said that it will take 300,000 pounds of oranges to get this much peel. As cull oranges are used, this order will stimulate the market in Redlands for cull oranges.

A NEW PROCESS OF PICKLING RIPE OLIVES.

[Written for Pacific Rural Press by Prof. W. V. Cruess.]

The Agricultural Experiment Station has, for many years, been investigating the matter of color in ripe olives. Various methods have been devised by the Station and by commercial packers for equalizing, intensifying and preserving the color. All of these were at first slow and imperfect. The method based on exposure to air, first published by the Station, has been most commonly used, but has the defect of requiring too much time. Many attempts have been made to shorten and perfect this method, especially during the last two seasons, and while the method has been improved it is still laborious and time-consuming.

Laboratory tests during the present season showed that darkening by aeration could be accomplished while the olives remained in the liquid and without exposure to the air. All that was necessary was the continuous circulation and aeration of the liquid. Larger tests were made under factory conditions. These were made at the pickling works of Hunt Bros., at Hayward, who kindly placed the necessary facilities at our disposal. Those tests proved that the method was equally suited to large scale work and was not only superior to direct aeration in equalizing the color, but was much more rapid.

Mr. Staley, the superintendent of the factory, was of great assistance in helping to work out the mechanical details of the process.

The method consists essentially in keeping the various solutions in more or less continuous circulation and aerating them by means of spraying or falling through the air, by air inlets to suction or discharge pipes, or by compressed air. The result is not only a more perfect coloring of the olive, but better quality and a remarkable shortening of the whole process. Olives require by the new process only 3 to 6 days from lug box to can, instead of 3 to 6 weeks, as with the old methods. This would increase the possible output of a factory many times.

Reclaiming a Flooded Alfalfa Ranch.

[Written for Pacific Rural Press.]

Last spring's floods took about 150 acres of E. H. Webb's alfalfa in San Pasqual Valley, San Diego county. But he still has some hillside, and already he is reclaiming the flat waste where the river raged. Looking down from his hillside home, what was alfalfa looks like pure sand. A lot of it is. That is why he is planting alfalfa on it now. Later on, say in March or April, that will dry out several inches deep, so that young alfalfa plants could not live. It was plowed in December and one piece was being sown Jan. 12. The heavier land will be sown between now and February 28, a piece at a time. Barley was sown 30 to 40 pounds per acre about New Year's to help protect the young alfalfa from wind-driven sand while it is small.

Some of the land is only 18 inches from the present watertable. It would not support old alfalfa, but a crop of four or five cuttings will be taken off the first year; then it will be plowed under in the spring to enrich the land. If left longer, the roots would probably rot off, according to Mr. Webb. While the alfalfa is on, if there is any overflow, which occurs about once in four years, the stubble will catch some soil. Where alfalfa is plowed under is the only place a good silage corn crop can be grown here.

The river channel is now in better shape than ever before, says Mr. Webb. It is wider, and restraining works have been put in on gentle curves or straight lines. Willow posts cut in January and driven butt-end down in the sand along the proposed course of the water, will root and form a more and more permanent bank. Brush cut and set slop-

ing down stream with the crotches against the posts will grow and add strength. Meanwhile a new barbed-wire has been stretched to connect a mile of such posts to help support each other when water presses hard against some. The brush will let some water through. Such back-water will not be so swift and will drop some of its sediment so that each flood will build it up some. The channel is to be kept free of drift-wood, which is one of the greatest causes of overflow.

Having started the reclamation of this land and having protected it, a lot of brush bottom is being grubbed out and leveled preparatory to seeding so new fields may be planted. No stumps are left on seeded land. "If flood water runs over smooth alfalfa, it doesn't hurt it," says Mr. Webb. "But if there is a tree, stump, post, or obstruction, the flood will dig a hole around it."

Before the flood, this land averaged about two feet above the winter watertable. The flood put as much as three feet of somebody else's dirt on part of this, really improving it for alfalfa in the one respect of getting it high enough so alfalfa roots can develop and live. Some of the filled-in dirt is silt, where the current was not strong, especially behind the willows of the river bed.

In exposed places it is more sand or gravel. But this sand, as Mr. Webb observes, disintegrates and turns dark under action of sun and air for three or four years if kept moist. Where the plow does not turn it up to the sun, however, it remains white sand. Between 50 and 75 acres was moved to the lower reaches and not filled in. This area is to be used for corn, beets, etc.

What the Cannery's Merger Means.

There has been some apprehension lest the newly formed merger of several cannerys into the California Packing Corporation might get growers into a corner some day. On this subject George N. Armsby, vice-president of the corporation, is reported as saying:

"The California Packing Corporation does not want to make a single contract for fruit or vegetables that does not show the grower a profit. If the grower does not prosper, we will not. We are dependent upon him for our supply of canning materials. We have got to see that he makes a profit. Although we own several thousand acres of orchards, we must still buy the great bulk of our supplies."

The old California Fruit Cannery's Association was a merger of many older concerns. Some were fearful that this strong organization might hurt the business. What happened? They built splendid modern canneries, made liberal contracts with the grower, so that the farmer, by taking proper scientific care of his orchard, could be assured of the profitable sale of his fruit for an indefinite period, and finally they inaugurated a big publicity campaign and increased the consumption of California canned fruits and vegetables. The business of all other firms in this line directly benefited.

"I believe that the fruit and vegetable growers of the State are going to be benefited by the merging of packing interests represented in the California packing corporation. There will be many economies affected, but most important to the grower, the market for his produce will be expanded by means of a world-wide advertising campaign, which this merger, by reason of its strong financial position, is able to make."

BEARDLESS BARLEY.

rice suitable for culture without flooding from a time shortly after it comes up until shortly before it is harvested. The Government Rice Experiment Station at Biggs probably has names of growers who have seed free from watergrass. Yolo County Horticultural Commissioner Wm. Gould of Woodland inspected several fields for certified seed the past season. Rice can scarcely be grown profitably on land that will produce a good crop of grain or fruit. It is essentially a crop for wet places that are not good for other crops.

KILLING RATS IN BARN OR GARAGE.

To the Editor: I would like to have you recommend some effectual method of getting rid of rats in a small barn or garage. Have only been troubled with them six or eight months, but the old ones will not touch a trap, eat strichnine or other poison.—Subscriber, Campbell.

might try this one: Saturate rags with carbon bisulphide and put down the holes as far as possible. The subscriber who recommends this says that if you can get the gases of carbon bisulphide near the rats they will surely die.—Eds.

Turlock Merchants and Growers, Inc.

[Written for Pacific Rural Press.]

The fiscal year of the Turlock Merchants and Growers, Inc., was ended Jan. 1. General Manager D. F. Lane's review of the year's work shows that they shipped this season 1,355 cars of cantaloupes, 315 cars of watermelons, 19 cars of grapes, some casabas and sweet potatoes, about 4000 tons of corn, and several carloads of beans. They financed growers for about \$6,000 worth of Rockyford seed and \$50,000 worth of shook. Twenty-five million stickers were distributed to grower members, one to be put onto each melon, and 700,000 labels were distributed to be put onto crates.

A cash advance of 15 cents per standard or pony crate and 10 cents per flat was made beginning the second week of the season, and a second advance gave the growers 87½ per cent of their money before final returns were in.

During the 1915 season, a corps of men was sent to the Rockyford, Colorado, district to get some seed. They selected 5000 pounds of Pollock's No. 25 which was distributed to members in order to have uniform melons to ship under the T. M. & G. brands. In 1916, men were sent again to Rockyford where they purchased the finest fields obtainable for 1917 seed.

During the past year 16 Imperial Valley and Colorado cantaloupe experts were employed to visit growers in their fields and show them how to grow and pack the melons up to standard. These men became inspectors at the receiving sheds when the crop began to move.

Shipping sheds were erected at Denair, McGill, Keyes, Turlock (one on each of two railroads), and a receiving station at La Grande. One at Turlock is 372 feet long, the largest in the State. Fifteen cars may be loaded at once from this shed by trucking through one line of seven cars to a line of eight cars on the next track. New shipping stations are planned for 1917 at Livingston, Hatch, and Hughson, on three different railroads. The Association had 141 men on its payroll last summer.

New Members.—During the season of 1916, 350 new grower members joined the Association unsolicited, making a total of 675. In

July, 1915, when that season opened, there were just 50 grower-members.

More about Crops Handled.—The value of 1914 cantaloupes was estimated at \$40,000. During 1915, the first year of the T. M. & G., the Association handled one-third of the crop and distributed \$140,000 among the growers. In 1916 they distributed \$380,000 to the growers for cantaloupes alone. With watermelons, this was the first season the T. M. & G. was able to get into the San Francisco market, which they did by establishing stores in San Francisco and Oakland. This year they handled 40 per cent of the local crop. Early in the season, they advertised in the East that 250 cars of Zinfandels would be available, emphasizing their value as table grapes. Rains almost destroyed the crop, but growers were paid \$15 a ton for the 19 carloads shipped, delivered in lug boxes at Turlock, and the Ass'n furnished the lugs. They were shipped in these lug boxes, one car going to Springfield, Mass. The T. M. & G. are the largest handlers of grain in the district, having stored grain in 13 warehouses this year. The cantaloupe shipping-sheds are converted into grain and bean warehouses to be used that way until June. The Turlock district, with its tributary country, had 8,000 acres of Egyptian corn, valued at \$250,000, and 3,000 acres of beans last year. In 1915 there were 5,000 acres of corn; in 1914, 3,000 acres. In 1915 there were 2,000 acres of beans; in 1914, 1,100 acres; in 1913, 1,000 acres; in 1912, the acreage was nominal. Many of the above statistics are taken from Mr. Lane's comprehensive detailed article written for the Turlock Tribune.

Other Plans for the Future.—A complete grain and bean cleaning plant is planned for the 1917 crop, including machinery for grading, polishing and weighing beans and for cleaning, weighing and rolling grain at about cost. Grain is to be stored for the usual spring rise in price.

Experiment Station.—F. H. Wilson, a University graduate instructor with much practical farming experience, has just been appointed by the T. M. & G. to experiment with all various crops adaptable to the Turlock district on two or three sep-

GOOD ROADS VALUABLE TO ALL.

Proposed road betterments are sometimes opposed by owners of property not abutting on the sections to be improved on the ground that it is unfair to improve at public expense a road passing the lands of a few men and leave other roads in an unsatisfactory condition. Such obstructionists assert that while they must pay road taxes they receive no benefits in return. Prof. B. K. Coghlan, of the Agricultural and Mechanical College of Texas, has recently reported some observations in that State which are a good answer to such claims. In one country where gravel roads extend but eight miles from town, farmers living beyond the improved roads haul wood during dry weather to the ends of these roads and pile it there. When bad weather comes and it is impossible to work in the fields, they haul this wood into town over the good roads without difficulty, and thus utilize a part of their time which would otherwise be largely wasted. One farmer uses two teams in hauling to the end of the improved road, where one team is unhitched and left with a friend and the other team used to draw the load into town. In another case, where the farmer formerly spent two days in hauling a single load to market, the construction of a good road for about half of the distance enabled him to make a material saving. He uses two wagons, each with two teams, which haul the loads in one day to the end of the good road. The next morning all the load is out on one wagon, which goes to town with one team, and the three other teams return home. These instances show that while it is desirable, of course, to have improved roads to each farm, where this is impracticable, all farmers derive considerable benefit from the improvements which it is possible to make with the available funds.

PURE ANIMAL MATTER
AMMONIATES

An ounce of Fertilizer Prevention is worth a pound of cure. It is easier, better and cheaper to keep your soil fertile and productive than to attempt to restore it after it has been exhausted by continuous cropping. Don't wait till your crops begin to fail. Use **Gold Bear Fertilizer---NOW!**

GOLD BEAR FERTILIZERS are made from animal products that contain the elements necessary to meet California soil conditions and crop necessities.

Los Angeles, Cal.

arate representative farms on different kinds of soil. Twenty acres have been leased, and 20 or 40 more are planned. He will work in co-operation with the University and County Farm Adviser C. M. Connor; and a very important part of his duties will be to act as a local farm adviser for members of the T. M. & G. He will figure all costs of production.

Finance.—For all of the services of the T. M. & G., including this experimental work, salaries, the Colorado seed selection, members' advisory work, shipping, and all expenses incidental, handling of shook at cost, etc., the Ass'n reserves 15 cents per crate for standards and ponies and 10 cents per crate for flats. It does not pay freight or Eastern brokerage out of this. It does not make any more, directly, if higher prices prevail than if lower; but if it does not show better sales and returns to

growers, than its competitors, of whom there are new ones in the field, its membership will vanish and its revenues decrease. So, while it is not paid a commission for its service, there is every reason for it to give the best service and so increase its membership and revenue and its returns to the growers.

DO NOT SOAK INOCULATED LEGUME SEED.

To the Editor: I inoculated melilotus seed for part of my orchard last year and planted part without inoculation. I had a good stand of vetch all over the 20 acres the season previous, but no cover crop of any kind had been grown before that, either in winter or summer. On the inoculated part of the melilotus the stand was not nearly so good as that not inoculated. Was it due to moistening the seed and then putting it into the dry hot soil early in September?—J. E. A., Fair Oaks.

[Answered by Western Soil Bacteria Co.]

While the querist is not one of our customers, we will all agree that if his seed had been moistened to any great extent and allowed to swell and then put in the dry soil the results would be about as he reports.

TOO LATE FOR MELILOTUS.

To the Editor: I am thinking of sowing melilotus in my vineyard which is over 20 years old. Do you think, if put in immediately, it would have a long enough growing season if I left it till March, or possibly April, before plowing? Do you think that subsoiling an old vineyard would improve or harm it? My vines are 6x12.—P. R. A., Dinuba.

Planting melilotus as late as November has often resulted in unsatisfactory stands. It needs warmer weather for germination, though after the first leaves are out it grows little all winter except roots. Your plan of letting it grow till grapes are well set is fine, for it will dry out the soil enough to help prevent coulure. We would like to know more of our readers' experience with root pruning such as you propose with the subsoiler.

SPREAD MANURE FRESH.

The Ohio Experiment Station shows that a ton of manure spread directly from the stable to the field is worth 75 cents more than a ton left in an open barn-yard for three winter months and then applied. Other experiments have shown that a ton of fresh manure treated with 40 pounds of superphosphate and spread immediately is worth nearly \$2.50 more than a ton of untreated manure left in an open barnyard from January to April.

CORN EAR WORM.

[Written for Pacific Rural Press.]

Corn ear worms spend the winter in pupal cells in the ground. Plowing and harrowing expose these to birds and frost or break them up or bury them too deep to come up. This is useful of course only where corn was grown last year. It is only a help, for the adults are flying moths which may come to your corn from neighbors. In the growing season powdered arsenate of lead mixed with an equal quantity of sulphur or flour is dusted on the silks where the eggs are laid.

Would you plant your fruit trees in large tubs?

"Without the use of dynamite in tree-planting," says U. S. Bulletin No. 38, "the roots soon meet with the smooth and compacted sides of the hole, through which they have great difficulty in penetrating. The tree is in about the same situation as if it had been planted in a large tub."

But when you plant your trees in holes blasted with

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

the trees will grow faster, develop deeper, stronger roots, and bear earlier. "When dynamite is used," continues the bulletin, "cracks are formed in the soil to distances of five or sometimes six feet on all sides. This makes the very best conditions for the continued growth of the tree. For tree planting dynamite is recommended confidently as the best method of preparing the soil."

In selecting explosives for your orchard work, be careful to get those that will crack, powder and loosen the soil, rather than pack it or throw it in the air. The proper explosives are the Giant Farm Powders. There are two of these—Eureka Stumping Powder and Giant Stumping Powder—both improved forms of dynamite, made especially to meet western agricultural conditions. They are sold by distributors everywhere. Ask your dealer for them.

FIELD CROPS.

According to advices from Tulare, a large acreage is being planted to grain in that county this year.

Rumor has it that a new sugar beet factory is to be built in Surprise Valley by capitalists from Utah.

The Alameda Sugar Co. announce that they will plant 2,000 acres of sugar beets in Sutter county this year.

Tobacco will be grown on 50 acres of land near Mountain View, Santa Clara county, this year, according to a report from that place.

Farmers in the southern end of Monterey county are said to be plowing every acre available with the intention of planting a large acreage to grain.

Nevada reports state that the Nevada-Utah Sugar Co. have contracted for over 4,000 acres of beets the coming season for their factory at Fallon.

A report from Southern California states that estimates of the 1917 beet sugar acreage are now placed at 75,000 acres, due largely to the good prices prevailing last season.

Rice is being shipped from Sacramento River points to San Francisco, 16,000 bags having been sent by boat from that district since the first of the month.

A movement is on foot in the Tullock district to increase the tomato and asparagus acreage to a sufficient extent to insure a good run for the local cannery.

A tobacco-growing experiment will be made the coming season on 50 acres of land near Los Banos by Arkelian Bros., extensive cantaloupe growers of the San Joaquin valley.

It is announced from El Centro that 70 per cent of the cotton crop of 1916 is picked and 60 per cent ginned. It is estimated that the crop of the Valley on both sides of the international line will be 65,000 bales, valued at about \$7,500,000.

According to the Southern Pacific Milling Co. there were 500 cars of lima beans in warehouses in Ventura and Santa Barbara counties on Jan. 1. There were also 11,035 bags of large whites, 179,713 bags small whites, 16,615 bags pinks, 57,287 bags blackeyes.

The advice of L. H. Stephens, president of the California Rice Growers Assn., to California growers is to hold their crop for better prices. He says that New Orleans millers are short of rice and will be in this market within the next 60 days. He believes growers will be able to secure 2 1/4 to 2 1/2 cents a pound for their rice by holding.

A report from Ventura says that estimates have been made that two months would be required to complete the work of cleaning the beans on hand in the warehouses that have been discarded because of the condition of the Eastern market. It is thought the demand will continue heavy and necessitate cleaning until late spring or summer.

The Southern Rice Growers' Association gives the total yield of rice in the United States for 1916 at 9,609,175 bags and the total acreage as 876,672. California is credited with 980,000 bags. In considering the crop by bags, it must be remembered that the bags used in the south are larger than those used in California, the average weight being, it is said, around 160 pounds.

Representatives of cotton gins at Calipatria predict that fully 25,000 acres will be planted to cotton in Imperial county this year tributary to Calipatria. Fifteen thousand acres, it is said, will be planted to cantaloupes, while there will be about 20,000 acres put in corn, barley and other crops. Over 10,000 acres have been planted to grapefruit during the past two years.

Onion growers in San Joaquin county predict a heavier planting of that crop in that county this season, some estimating the increased acreage at two or three times what it was in 1916. Last year 3750 acres were in onions in that county. Reports from the same district estimate the potato acreage for the coming year at 30,000 acres, an increase of 7,000 acres over that of 1916.

The International Institute of Agriculture at Rome, Italy, estimates the wheat production of Argentina at 70,000,000 bushels, one-half that of last year. Australia's wheat crop is estimated at 135,000,000 bushels, which is four per cent better than the yearly average. For the world's eighteen most important countries, including the United States, Canada, British India, Japan and all Europe, the estimated total wheat crop is placed by the Institute at 2,500,000,000 bushels which is 25 per cent less than last year.

It is announced from San Luis Obispo that a \$28,000 garden pea crop is now being harvested near Pismo off of 85 acres. The peas are bringing 10c per pound and are being shipped to the Los Angeles and San Francisco markets. In speaking of fruit, the County Horticultural Commissioner says there are the following acreage in trees in the county: Almonds, 3388 acres; apples, 1046; pears, 1978; peaches, 797; prunes, 993; apricots, 626; walnuts, 639; cherries, 38; grapes, 291; mixed, 333; lemons, 23, and berries, 13.

A decrease of sixty million bushels in the corn crop from the estimate made in November and an increase of 32,000,000 bushels in the wheat crop were shown Dec. 15 in the Department of Agriculture's final estimates of the country's important farm crops. Their value, based on prices being paid farmers Dec. 1, show these figures: The corn crop is worth \$573,103,000 more than last year's; the wheat crop \$83,462,000 more; oats \$96,673,000 more; potatoes \$95,071,000 more; hay \$95,250,000 more; tobacco \$72,727,000 more and cotton \$475,378,000 more.

DECIDUOUS FRUITS.

The first commercial shipment of walnuts was made from Chico recently to parties in Stockton.

Reports from Porterville indicate that there will be a considerable acreage in that district planted to prunes this season.

O. E. Bremner, county horticultural commissioner of Sonoma county, has recently condemned a shipment of prune trees that were shipped into the county because they were infected with peach borer.

Apple growers of the Yucaipa Valley predict a bumper apple crop this fall. Growers say that the trees have put out more fruit spurs this winter than ever before and this is always an indication of a big crop.

The first of four carloads of pear trees that are to be planted in the Atascadero district of San Luis Obispo county have been received. It is the intention to plant 1200 acres of land to that fruit there this year.

Announcement is made by the California Peach Growers Inc. that a contract has been made with the newly formed California Packing Corporation whereby the latter firm will market all of the peaches of the former association.

The Winters Dried Fruit Co. have recently purchased the plant of the Winters Canning Co. The canning of fruit will be discontinued, the entire interest being centered on green and dried fruit packing and shipping.

On account of the large acreage of beans and pimientos which have been signed up in the country sur-

Remco

SILOS TANKS PIPE

For dairymen, farmers, feeders in all sizes and proportions.

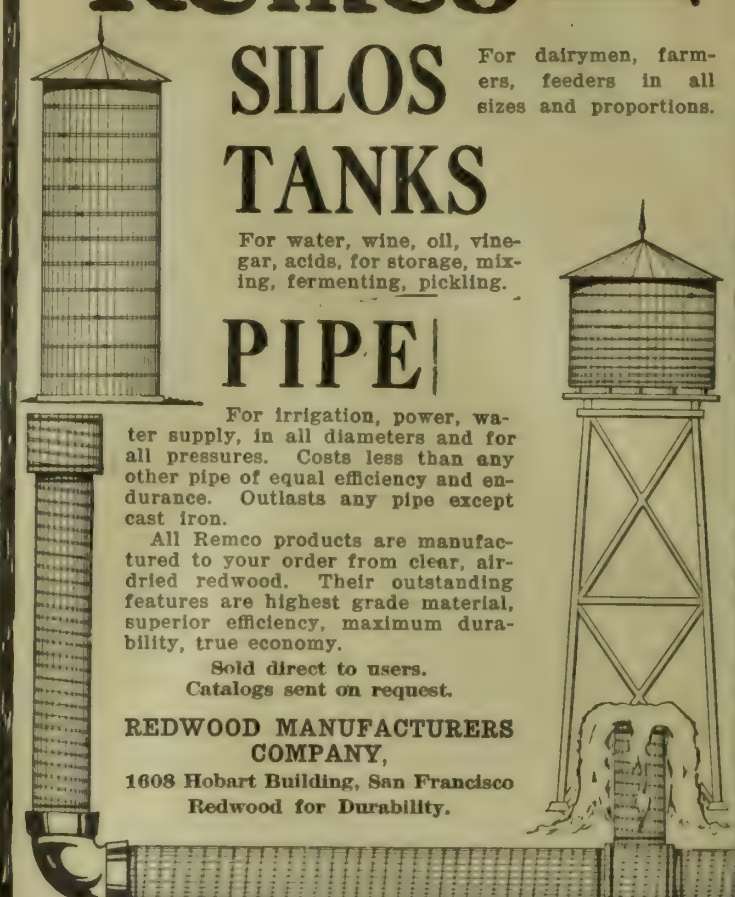

For water, wine, oil, vinegar, acids, for storage, mixing, fermenting, pickling.

For irrigation, power, water supply, in all diameters and for all pressures. Costs less than any other pipe of equal efficiency and endurance. Outlasts any pipe except cast iron.

All Remco products are manufactured to your order from clear, air-dried redwood. Their outstanding features are highest grade material, superior efficiency, maximum durability, true economy.

Manufactured and Sold Exclusively by
SPALDING-ROBBINS DISC PLOW CO.
625 MARKET ST., SAN FRANCISCO

rounding Santa Ana, the California Packing Corporation announce that they will reopen the cannery at Santa Ana.

In their survey of deciduous fruit supply, the Chamber of Commerce of Riverside county report 1959 acres of apricots, 1145 acres peaches and 535 acres pears. It is argued that a cannery is needed in that district to care for the large amount of fruit being grown.

The California Prune and Apricot Growers' Inc. have appointed Geo. E. Merrill to act with the members of the campaign committee favoring the establishment of a deciduous fruit experimental station. They will endeavor to get the present legislature to provide funds for such a

station with adequate equipment.

The first concerted action on the part of the growers of the State to obtain a deciduous fruit research and experiment station have been taken. A. V. Stubenrauch, professor of pomology at the University of California, and W. L. Howard, associate professor of pomology at the University Farm school at Davis, have effectively explained the value of such an institution and its requirements.

According to J. F. Niswander, general manager of the California Peach Growers' Ass'n, there were only about 9,000 tons of dried peaches held over from 1916 on January 1 and he believes sufficient demand has been created to more

than take care of this amount before the new crop is ready to market. The 1916 crop totaled about 30,000 tons, compared with 34,000 tons in 1915 and 38,000 tons in 1914.

County inspection of deciduous trees for peach tree borer in the Hemet district is aiming to clean out this pest. Where borers are found in an orchard they are chiseled out, all crown gall taken off, disinfected with fire in some cases, and with corrosive sublimate and other chemicals in others, to some distance down on the roots, and fumigated with cyanide under tents like citrus trees. The work except inspection is charged to the orchard where it is performed. It costs about 20 cents per tree besides fumigation.

CITRUS, NUTS, SEMI-TROPICAL.

The cannery at Porterville has finished its olive pack for this year.

Advices are being received by orange growers at Lindsay from the East to the effect that prices for holiday oranges were good, one grower netting \$1.66 per box for his fruit.

The California Olive Growers' Ass'n are just completing the second largest and best-equipped oil and pickling plant in the state at Fallbrook which will cost \$15,000.

Orange packers in the Pomona district are said to be withholding eastern shipments of fruit till such time as their fruit is more mature and till markets in the East are in better condition.

In order to relieve the car shortage the Santa Fe railroad suggests that citrus fruit shippers load 448 boxes to the car instead of 384 as at present. This would relieve 8,000 cars for the shipping season.

Orange growers in the district west of Tapo and south of the river in Ventura county with approxi-

mately 1200 acres, of which 300 are in bearing, held a meeting last week to discuss joining the California Fruit Growers' Exchange.

The Tulare County Growers' Ass'n who are contemplating the purchase of a cannery in Tulare county are investigating the device for peeling of oranges as they believe there is a possibility of utilizing the cull oranges in the making of marmalade by its use.

Shipments of citrus fruits from the Riverside district have been small since the Christmas pool, partly attributable to the frosted oranges which have been rushed to market by Tulare shippers. It is expected that by the middle of the month shipments from all southern points will be back to normal.

California olive growers will ask the incoming Congress to increase the duty on olive oil from 20 cents to 60 cents and add a tariff of 25 cents a gallon on ripe processed olives. It is stated that with such an import duty, many thousand acres of land in the State could be profitably set out to oil olives.

The Lindsay-Merryman Citrus Exchange passed a resolution at their last meeting favoring the formation of a Standardization Committee with power to regulate and prevent shipment of immature fruit. The commission would consist of State Horticultural Commissioner, State Market Director and Director of State Board of Health. Approximately 4,000 acres are represented in the association.

In our issue of Dec. 23 we clipped a paragraph from an exchange which stated that the Northern California Olive Corporation would open a retail store in New York City. Commenting on this paragraph, H. Pierson Burt, president of the corporation says: "Mr. Fowler is a small stockholder, not the principal one, and we have no intention of opening a retail store in New York. We have this year sold several cars of olives to the large New York wholesalers, and it would do us a great deal of damage with the wholesale trade if it were learned, even inaccurately, that we would enter the retail business."

VINES AND VINEYARDS.

J. W. Jeffery has started his investigation into vine diseases at Dinuba having as his assistant W. B. Baird of the University of California.

It is estimated that 300 cars of Emperor grapes were shipped East this year in drums. Those that were sent before the rains arrived in fine condition, but some of those shipped after the rains did not fare so well.

Because of their success in increasing raisin consumption by the more general consumption of raisin bread, the California Associated Raisin Co. propose to start a similar campaign for "raisin pie." The campaign will be national in scope as have been their other campaigns.

According to the annual report of the viticultural commissioner, there were 126,000 tons of grapes harvested in California during 1916 as compared to 124,000 tons in 1915. Thompson Seedless production showed the greatest gain, the production of Sultanas and Muscats showing a slight decrease.

The Associated Raisin Co. will pay another advance to its growers who delivered their seedless crops to the company. On Jan. 25, it is announced, they will pay \$40 per ton on Sultanas and \$50 a ton on Thompsons, in addition to the advance paid on delivery. Final settlement, of course, is still far in future.

The American Federation of Labor has organized, under the name of Agricultural Workers' Union, the vineyard workmen of central California. The agreements signed by the union call for an eight-hour day at \$2.50; gangs of eleven or more to be furnished with a cook by the vineyard owners; gangs of under eleven or under to be furnished with a cook for five hours; gangs

working more than five miles from the city to be furnished with sleeping quarters and other accommodations; and a water boy for service in the vineyards.

MISCELLANEOUS.

Santa Barbara county sold last year, olives, lemons, walnuts and beans to the extent of \$3,000,000.

Applications for loans under the Federal Farm Loan Act to the amount of \$140,000 has been received at the Solano County Farm Adviser's office.

According to Prof. D. N. Morgan, 800 farmers in California had signified their desire to borrow money through the Federal Farm Loan bank, up to Jan. 11.

Once more the House of Representatives at Washington has appropriated money for the "free seed" budget, notwithstanding opposition from farming interests.

Marcus A. Lee has been appointed to succeed Professor C. W. Rubel as farm adviser in Alameda county, Rubel having been promoted to the post of assistant State leader.

Frank Lyons, Farm Adviser of San Joaquin county, has resigned his position to engage in farming. Ralph D. Robertson has been appointed to fill the position.

The supervisors of Sacramento county have appropriated \$2,000 a year for the expenses of a farm adviser. February 1 is set as the time for the adviser to commence his work.

Commercial interests and livestock breeders in Yolo county are already making plans for a big county fair at Woodland this year. The tentative dates have been set at August 29 to September 1.

State-wide meat inspection is proposed in a bill to be presented in the coming legislature, backed by State Veterinarian Charles Keane. The inspection expense would be covered by a system of fees.

Farm loans aggregating \$80,000 have been recommended by the Humboldt County Farm Loan Association. The association was organized under the provisions of the new Federal land bank act.

California rice interests will be represented at the National Foreign Trade Commerce to be held at Washington, D. C., by S. M. Phillips, who will encourage favorable legislation for the benefit of American rice growers.

The year of 1916 was a good one with ranchers of Orange county. Its lima bean crop has been put at 350,000 bags worth \$5.00 per 100 pounds, and blackeye peas 70,000 bags worth \$3.25 per 100 pounds. Its walnut crop is said to have been worth \$1,500,000.

PRUNE AND APRICOT ASSOCIATION ASSURED.

On Tuesday morning of this week there still remained \$20,000 worth of stock in the Prune and Apricot Growers' Ass'n to be subscribed for, the balance of the \$500,000 worth having been signed for by growers all over the State.

It had been hoped that all of the stock might be taken up by Jan. 15, which was termed "Sign up Day," but the executive committee declined to proceed with the election of directors till the entire stock issue had been cared for. For that reason the closing date was postponed. As this is written a report from San Jose says that the organization committee feel certain the required amount of stock will be sold, as a conference of large growers who have not heretofore subscribed for stock is being held and will likely take the remaining shares.

Just as we go to press Mr. Geo. Merrill, Secretary of the Prune and Apricot Growers' Association, advises us by phone that the acreage required as a basis on which to proceed with the organization has been signed up and that the election of trustees will be proceeded with immediately.

MISSION OLIVES EARLY RIPENERS.

THE EHLMANN OLIVE CO.

Oroville, Cal., Nov. 17, 1916.

Mr. W. A. Hayne, Box 481, Marysville, Cal.
Dear Mr. Hayne: Answering your kind favor of the 16th, I am enclosing herewith photograph of some of this year's fruit on the Fogg grove, and you will note that they are above the average Mission. We also were able to harvest this entire crop before the frost, which shows that they are early ripeners.

We will be glad to keep in touch with you on this matter, and if we can be of any further service, don't hesitate to let us know.

Yours very truly,
(Signed) E. W. EHLMANN.

I propagated the Fogg orchard thirty years ago. The origin of the Fogg trees was directly from the old Mission at Santa Barbara. The trees I have now for sale are full brothers to the Fogg olive trees, and, like the Fogg trees, they are all propagated from the large size cuttings.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

CONSTRUCTING A CONCRETE FLUME.

To the Editor: What size concrete flume is necessary to carry stream from a 4-inch centrifugal pump (estimated 400 gallons per minute), with a fall of 2 inches per hundred feet. Flume to be built on top of

ment to 5 parts coarse sand and gravel should be used. The cost will be from 20 to 25 cents per lineal foot, depending upon conditions.

The sketch shows the method of making and placing a set of the above described forms.

Cross-section View of Concrete Flume.

earthen embankment across a swale a distance of 1200 feet. Seven hundred feet from pump is a branch at right angles 400 feet long. Want to make flume of rectangular or obtuse angled cross section. How thin can the walls be made, and of what proportions? Can get coarse sand. —Subscriber, Galt.

[Answered by S. H. Beckett, Assistant Professor of Irrigation Practices, Univ. of California.]

A rectangular concrete flume with a bottom width of 12 inches and 9 inches in depth will safely carry 400 g.p.m. when laid on a grade of 2 inches per 100 feet. The side walls of such a flume should be 2½ inches thick on top and 3 inches at the bottom. The thickness of the floor should be 2 inches.

Such flumes are constructed on the ground, using a set of 12-foot forms into which the concrete is placed. These forms consist of outside walls, held in place by stakes driven in the ground or by a heavy U-shaped straddling iron. The inside form is built in the shape of a bottomless trough held a proper distance apart by spacing blocks. To build the bottom and sides at the same time the inside form must be blocked up to a height equal to the thickness of the floor. Small shrinkage cracks will probably occur at the joints, and these may be filled with heavy asphalt oil after the forms have been removed and the concrete set.

In building a considerable length of flume a quick removal of the forms is necessary; this is possible by using a comparatively dry mixture of concrete, thoroughly tamped into the forms. This requires the concrete to be kept moist (generally by sprinkling) for a period of several days or until the concrete has thoroughly set. In building such a flume it is necessary that the foundation be thoroughly settled before construction begins. A settling of the flume destroys the grade and generally leads to disastrous results. A mixture of at least one part ce-

TRACTORS IN CALIFORNIA.

To the Editor: How many tractors are there in the State?—C. C. C., Palo Alto.

[Answered by Prof. J. B. Davidson, University Farm.]

We have little information on which to base such an estimate. We understand that there are 1600 tractors of one make in use in this State. We believe that all the others put together would not ex-

ceed 1900; of these, perhaps 750 are tractors made outside the State.

We do not consider this estimate very reliable.

And if you don't want to sell, your increased yearly profits are just like turning waste land into cash. Progressive land owners in every State and practically every county in the Union have discovered that the *only* way to bring their land up to the desired state of production is to get a

Bostrom \$15 Farm Level

and make spare days the most profitable days. Also fills the bill for Grading, Road Building, Foundation Work, etc. The Bostrom Farm Level has been on the market over thirty years, the latest improved having a *Telescope with Magnifying Lenses* which enable you to see the cross on the Target a quarter of a mile away. Man Size Tripod, Leveling Rod, Target, Plum-Bob and full instructions included. Weight, 15 pounds. It is used and endorsed by Agriculture Schools and U. S. Farm Demonstration Agents, and you will endorse it, too, after using it—if not *Your Money Back*, including express both ways. Write today for description of *Level and Telescope*, details of our *Money Back Guarantee*, and names of *Jobbers* in San Francisco, Sacramento and Los Angeles who carry it in stock. BOSTROM-BRADY MFG. CO. 105 Madison Ave., Atlanta, Ga.

Read This Before You Buy a Tractor

If you could be sure you were getting the right tractor—a good reliable, economical machine—wouldn't you buy one for this Spring's work?

You have hesitated to choose from the many offered because you could not be sure that the tractor you bought would be the best one for you. That is the policy of a good business man.

The two claims made for most tractors are these—That the tractor will do your work and that it runs on kerosene. These two features are vital. They should be **guaranteed**, not merely claimed.

They are guaranteed in Mogul tractors.

Mogul tractors are guaranteed to do good serviceable work and to operate successfully on kerosene. The order blanks contain a warranty to that effect giving you the written guarantee of a responsible Company.

What better assurance than this can you get?

Buy a Mogul tractor—a tractor built to International Harvester Company of America

(Incorporated)
Crawford, Neb. Denver, Colo. Helena, Mont. Los Angeles, Cal.
Portland, Ore. San Francisco, Cal. Spokane, Wash. Salt Lake City, Utah

Mogul 8-16
Kerosene Tractor
\$725 Cash f. o. b. Chicago

operate on kerosene; that does operate successfully on kerosene; that the Company guarantees to work on kerosene; making that guarantee in the printed warranty that you keep when you order.

Mogul 8-16 is without doubt the most popular and successful kerosene tractor on the market to-day, and no wonder. It has a simple,

one-cylinder, slow speed, kerosene burning engine with crank case completely enclosed to keep out dirt. Hopper cooled. Starts and runs on magneto. Mechanical oiler takes care of all engine bearings. No gears to shift. Chain drive. Travels at correct plowing speed for section where sold. Turns in a 10-foot radius.

Does all the heavy field work that horses are used for, and any belt work up to 16 H. P.

Because Mogul 8-16 is so popular, it is not always possible to make quick delivery. Now that the kerosene burning feature is guaranteed, sales will be still larger. Don't wait. Start now to investigate. Your order will have to be placed soon to insure delivery in time for the first good plowing days of Spring.

ENGINE SILAGE CUTTER SAVES FIRST CROP ALFALFA.

[Written for Pacific Rural Press.]

While J. M. McKindley of San Joaquin county uses electricity for most of his pumping for 116 acres of orchard alfalfa, and corn, his 25 h.p. gas engine, 130-ton silo, and 17-inch silage cutter are about equally useful. The alfalfa crop last spring was infested with broncho grass and foxtail, so that it would not have made good hay; yet he could not afford to lose it; for he has 32 cows and several bulls, besides young stock which live on alfalfa and silage.

The crop was cut when in full bloom, and run through the silage machine direct from the mower. It made good silage with no bad smell. It reminded Mr. McKindley of the smell of tobacco curing. The cows seemed to like it as well as corn silage, but gave better yields on the latter because of its more balanced nature.

Silage was fed all summer. Five acres of corn from old alfalfa land was cut early and put on top of the alfalfa silage. Only 2/3 of this had been fed out in November when corn was bought to fill the silo again. As the aim is to feed about 900 pounds per day, to the average of about 30 cows milking, this ought to last, with addition of alfalfa next spring, until late corn is ready to cut for silage. Alfalfa pasture and hay supplement the silage when available and needed.

The Engine is mounted on two 8x8 timbers 12 feet long so it can be moved from place to place. Its two flywheels extend a foot below the timbers so they make good wheels for moving. Holes in the ground must be dug for them while in use. Five cells and a coil supply the spark for starting, but a magnet run by the flywheel keeps it going. An 18 h.p. engine would run the silage cutter, says Mr. McKindley, so he has an abundance of reserve power.

TRACTOR NOTES.

[Written for Pacific Rural Press.]

A minimum of repair expense, and only half a day of lost time in rush work have been obtained from Baird Bros. 60 h.p. tractor bought in 1911 for their 11-acre Yolo county grain ranch.

Their tracks are not jerked to pieces by sudden, heavy starts. When noticeably worn, they are repaired before they get stretched out. When a track is stretched badly, it wears the sprocket teeth too, by catching on the tops of the teeth. Baird Bros.' engine was run until the first-motion chains were stretched, so a link was taken out. It then ran until last spring when a new chain was put in because it had stretched still another link. New liners were also put in. They keep an extra track on hand, however, for emergencies.

The Motor is generally taken down twice a year, at the beginning of fall work and of summer work. It takes a day or two to overhaul the motor and grind the valves, etc. Last spring was the first time they gave the entire tractor a general overhauling. This took two men three days. It paid well, for it resulted in steady work when the work season was on.

KILLEFER EFFICIENCY

KILLEFER
QUALITY

We believe our 1917 model beet cultivator is the strongest tool of this kind made; and this strength is not accomplished by the use of heavy cast iron and steel parts, but by using the higher grades of steel which give the utmost strength and make a light but rigid implement. They are guaranteed to the user for quality of work, ease of operation and durability. An advance in price must be expected on all kinds of implements and we advise our customers to get orders in as early as possible.

Livestock Facts and Fancies---XVII.

SOME BASIC PRINCIPLES GOVERNING THE BUYING AND SELLING OF PUREBRED LIVESTOCK.

[By the Editor.]

Separate Interests Have Separate Problems.

Last week we preached about our notion that there might be in the livestock marketing in this country two quite different sets of conditions and problems, which might have to be solved in two different ways. There might be one commercial way for the higher-ups and a very different way for the lower-downs. We use these terms quantitatively and not with any reference to moral or intellectual quality in either, for that would involve comparisons which are odious. For example, we can conceive that "Paddy and his Pig" may have as reasonable a conception of how to save his commercial bacon with that pig as Mr. Jastro may have of how he can make his 25,000 cattle commercial tenderloin—that is, supposing Paddy is as deep-thinker and deep-seer as Mr. Jastro is known to be. And so we use the terms higher-ups and lower-downs with neither adoration nor condemnation; both are exactly the same to us if we can do them any good. If the higher-ups find out, by the investigation which they are calling for, that, for their purposes and capacities, the packers and stockyard magnates are cut-throats and pirates, let the range men perform those pleasant functions for themselves. On the other hand, if these capitalistic packers and hotel-keepers for livestock are better for the small growers than the agencies which they now have for turning animals into cash let them call for more of them. We do not see that there need be any conflict between the two, for they are so different in quantities and capacities that they may need dif-

ferent cures for existing evils, as we have already suggested. In truth, we are not sure but the creation and capitalization of their own packers and stockyards by the range men and the multiplication of proprietary packers and stock-yarders, through a more direct trade with farm-growers of the animals they need, may, by their inter-action, make things continually better for the farm-growers, and for consumers also, by increased competitive transaction which will pay the farmer more and charge the consumer less, through the elimination of the multitude of parasitic middlemen who are now pushing out of plumb every one they can get a shoulder on. Of course we do not claim to know whether these things are true or not: we are only talking as though we knew, for the purpose of shelling some trenches to see if there are any facts in them.

Two Distinct Lines of Procedure.

But this is not the real theme for this week's sermon, though the text is in it. Our present thesis is approached by an analogy. If there are two methods of development and progress on the selling side: one for the higher-ups and the other for the lower-downs, always speaking quantitatively and not otherwise, may it not be also true that there are also two very different and still rational avenues toward progressive development and popularization of purebreds on the breeding side? We apprehend that there are two distinctly different lines of policy and procedure in promoting the sale of purebreds for breeding purposes, and the broad interests of the industry may make both of them rational—each in its own way and for its own ends. Favor for one does not mean disfavor for the other; in fact favor for one may make greater favor for the other more desirable.

Will Sky-High Prices Popularize A Breed?

We have condemned trickery in livestock selling. Trickery consists in jockeying animals, in its lower forms. In its higher forms it may mean conspiracy to inflate prices beyond real values and to entrap the ignorant and unwary by propagating ideas that certain animals are worth more for common pure-breeding purposes than they really are. To resort to either of these lines of falsification to raise current values is deceit to the individual buyer and disastrous to any breed of animals which is treated that way, because it turns popular attention to other breeds and therefore injures all who own animals of the breed which is subject to such inflation. The worst thing that can happen to a good breed is to subject it to boosting by conspiracy. It creates no permanent or general advance in values and therefore cannot be rightly claimed to serve the interests of all who have the breed. General values advance now-a-days chiefly by performance. When fancy values are lifted beyond the relative merit of

producing values the breed loses real friends and supporters and falls into popular discard. This is not a theory; it is a fact, and it has been realized, more or less anciently, with a number of good breeds, and it is likely to fall upon any breed, no matter how good it is, when men go wrong with it.

Are Extreme Prices Ever Warranted.

"But," says some reader, "on the basis of such reasoning, do you hold that purebred sales expecting fancy prices and laid out to secure them, are wrong?" Not at all, if the stock is as represented. Fancy sales with honey-tongued auctioneers and highly professional exhorters on the platform and cricket-jumping demonstrators in the ring are all right for the higher-ups, who know what they want and why they want it. An auction sale of dress-coats is just as legitimate as a sale of overalls—providing the buyers can afford to spend the money and do not buy the swallow-tails to milk in. And providing they can afford to blow the money, it is legitimate to milk in a dress coat, but it is rough on the coat and shows that the buyer lacks common sense. It is much the same way with these higher-up sales of

breeding animals which are laid out so that the average overhead cost per animal for scenic features is a good part of what a good serviceable purebred is intrinsically worth. They are perfectly proper, if they are not conspired, and they serve an excellent purpose among fancy breeders for they put a cash-measure upon fancy points which such breeders may need very much in their

GIVE YOUR COWS and YOUR-SELF A SQUARE DEAL

The more energy your cows are obliged to spend fighting flies, combatting disease, and striving for physical comfort, the less they have for milk production. They are sensitive animals, and can do their best only under the most favorable conditions.

Transfer your herd to comfortable, sanitary, Loudon Steel Stalls and watch the milk supply jump! The cows will be healthier, more contented, more productive; they can't help it.

That's one side—the cow's side.

Then there's YOUR side.

The increased production is clear profit—often a good margin in itself.

The stalls simplify the care of the cows. It's but a few moments' work to open the stanchions or snap them shut, and once in place you know the cows are safe. No chance to get loose, to become entangled, or to trample one another.

Let us quote you prices for your complete equipment.

business—whether it be for nicking-in, or for pedigree-writing, or for prize-winning or for advertising—we do not care which it is for, for they are all legitimate factors in the fancy line. But to glory in paying high prices simply because they are high is foolishness; and to glory in high prices for the general purposes of popularizing the breed and winning favor for it, is mistaken, because it will surely work the other way, as we have suggested.

Who Is Justified in Paying High Prices?

"Well, then," persists the obstinate reader, "no one but a fool or an ass will patronize such sales and pay such prices: is that your argument?" Not at all. If a breeder knows what he wants in an animal of a certain form, pedigree and relationship and knows what he can do with the characters the animal embodies, it may be wise for him to go his whole pile to get it and the glory incidental to his getting it may be a valuable consideration also. We do not object to a knowing man paying as much as he likes for what he wants—providing he does not have to mortgage his automobile to get it. Our obstinate reader cannot trap us into making such an admission as he desires. Instead of that we will say, boldly, that these fancy sales are, as a rule, perfectly legitimate for those who take part in them. They are for the men who know what they are doing, and if a sucker falls in occasionally he learns what's what afterwards. It is childish to blame the mudhole for the sucker's muddy pants.

We Need Sales of Purebreds for Practical Farmers.

"But," again retorts the obstinate reader, "you do not find common farmers buying at such fancy sales." That is perfectly true and always will be. In the nature of things buying and selling at higher-up sales must be either real or pretending fanciers and with that understanding the projectors of such sales are entitled to hear the best that can be truly said of them, and it is our regular practice in this journal to do that. But we are just as sure that the general industry of breeding purebreds needs an entirely different method of disposing of its output of surplus animals, with entirely different methods and purposes, and with satisfaction at an entirely different range of prices. Our readers will have to guard their faith in particular breeds against the reaction in popularity and values which unwise boosting brings about, because boosting for fancy points is apt to reduce appreciation of actual producing values. Therefore we need sales which are not dominated by interests of fancy breeders and traders. We need to have embodied in buying and selling of purebreds, the everlasting truth, in fact and principle, which we are always trying to enforce in these columns by publishing in detail what our readers are doing with purebreds in actual farm production. We need public sales conducted on this basis to which farm breeders can send good purebreds in quantity, at which the mere overhead of a fancy sale would constitute a good profit. Until these are provided the intending buyer

Easy to Turn-Why?

BECAUSE the women-folks can turn as slow as they please, and still get all the cream!—true of no other separator. Most separators have to be turned .55 to 60 turns a minute or they lose cream. But if you want, you can turn a Sharples at only 38 or 40 revolutions per minute and still get a perfect skim—for the wonderful Suction-feed drinks up the milk only as fast as it can perfectly separate it. Again, the bowl hangs from a single frictionless ball-bearing running in a constant bath of oil. That, too, means easy turning. The bowl has no heavy discs in it—little power is required to set it spinning.

SHARPLES SUCTION-FEED CREAM SEPARATOR

- is the *only* separator that will skim clean at widely-varying speeds
- is the *only* separator that delivers cream of unchanging thickness—all speeds
- is the *only* separator that you can turn faster and finish skimming quicker
- is the *only* separator that has just one piece in the bowl—no discs, easy to clean
- is the *only* separator with knee-low supply tank and a once-a-month oiling system

Made and strongly guaranteed by the largest and oldest separator factory in America. Repair cost is practically nothing—so ruggedly built that many a Sharples has not cost one dollar for repairs in fifteen years. Over a million users—in every dairying country of the world. Send for catalog to Dept. 31.

Economy of Shelter for Dairy Cows.

[Written for Pacific Rural Press.]

While only a wild guess could be made as to the loss dairymen experience in wet weather through exposure of cows to the storms and standing in muddy corrals, it is known to be large by every dairyman who has watched his milk flow drop, despite good feeding, as soon as the rains commence.

With this fact in mind we are led to believe that too much emphasis is sometimes placed upon our mild winters with a resultant lack of shelter for the cows.

Of course breeders who are making records with their cows long ago discovered the necessity of dry quarters and while in most cases these quarters are crude affairs they answer the purposes fully as well as more elaborate ones. An illustration of this was seen on the J. S. Gibson ranch at Williams, Colusa county, the past year when the cow Winnie Korndyke Cornucopia De Kol was making her world's milk record for cows of her age. Her quarters were in an improvised horse barn, alongside of several other test cows, none of which were provided with more than bedding and feed from the manger.

We only mention this to show the importance herdsmen attach to shelter, even in California, and not as an example of how dairymen with large herds should operate.

But shelter for the dairymen is equally as important and need not be expensive if a building similar to one used by the Golden State Dairy Farms Co. at their ranch near Dixon is constructed.

Pasteurized milk is sold from this dairy and while a separate feeding barn is desirable in such cases, such

a building as theirs would be warranted for protection from weather alone.

It is made of rough one-by-twelve lumber, set upright without batting. The building is 22 feet high and long enough to accommodate 50 cows on each side, having a gabled roof, covered with galvanized iron.

The stanchions are built along the side-walls with room in front for the manger. An opening three feet wide runs the entire length of each side, allowing a workman to drive his wagon along the outside and throw the feed directly from wagon to manger. At the time of our visit corn silage was being fed in this manner and alfalfa hay in the milking barn, but either hay or green alfalfa can be fed in the same manner in the feed barn.

The floor is of concrete, with a drain through the center of the building and entrance is gained at both ends where sliding doors are provided. While we were unable to ascertain the cost of this building its unit cost per cow must be low.

At the time of our visit, a heavy rain had made the corrals on the ranch so muddy as to forbid entrance without boots and the adjoining alfalfa fields would have been severely injured by using them for corral purposes. Without the feed barn, milking under these circumstances would have been severely handicapped, but with it the cows could be stabled on a dry floor all night as well as fed there also twice a day without discomfort. Needless to say they were giving a larger flow of milk than if compelled to stand in the muddy corral day and night.

Study of Milking Machine Efficiency.

[Written for Pacific Rural Press.]

Milking machine efficiency is largely governed by the number of cows in the herd and the way they are operated, according to the U. S. Dept. of Agr., which has just conducted an investigation in the East and Middle West on 269 mixed farms and specialized dairies. As will be noted in the following table, the saving in labor cost is greater with herds of 15 cows or more than it is with a lesser number. The report says that

two cows. The data collected is summed up in the subjoined table:

BEAN STRAW FOR HORSES.

To the Editor: Is ripe bean straw good for horses and what is its value compared to alfalfa?—Subscriber, Merced county.

Yes; it contains more carbohydrates and less protein and fat than alfalfa hay. If your horses are not doing heavy work they can

Size of Herd	Machine Milking							Hand Milking	
	Number of farms with herds of each size	Interest on investment (per cow)	Value of milk and oil (per cow)	Cost of repairs (per cow)	Depreciation (per cow)	Labor cost (per cow)	Total cost (per cow)	Number of farms with herds of each size	Labor cost (per cow)
15 cows and less	32	\$1.26	\$9.94	\$0.20	\$1.98	\$7.39	\$11.77	28	\$10.91
16 to 30 cows	72	.79	.84	.20	1.90	7.31	10.14	63	10.26
31 to 50 cows	41	.61	.84	.25	1.49	6.03	9.22	16	10.11
51 cows or more	11	.56	.83	.36	1.12	4.47	7.34	6	10.45
Average	156	.82	.86	.22	1.24	6.79	9.93	113	10.41

milking machines must be operated by competent operators and that stripping by hand is essential if satisfactory results are to be obtained. The majority of farmers interviewed by the investigators believe that the machines have no effect one way or the other on the general welfare of the herd. They also found that the milking is most quickly accomplished when each milker operates and strips after two units, each of which milks

probably be wintered on good bean straw and a little pasture of some kind. If they are working hard, a little alfalfa hay and grain in addition to the straw would be better.—Eds.

The Standard Packing Co. of Los Angeles purchased 128 head of steers from Cutler Bros. of Visalia recently at an average price of \$100 a head.

COST What you put into a Cream Separator **VALUE** What you get out of your Cream Separator

It isn't the "out go" but the "income" that determines the real value of a Cream Separator

It's Cheaper to Buy a DE LAVAL CREAM SEPARATOR

VALUE depends upon the amount and the quality of service the article gives you—what you get out of it.

You get by far the greatest actual VALUE for your money when you buy a De Laval—BECAUSE it will give you much better and longer SERVICE than any other separator.

From the standpoint of its greater durability alone, the De Laval is the most economical cream separator to buy, and when you also take into consideration its cleaner skimming, easier running, greater capacity and less cost for repairs, the price of the "cheapest" machine on the market is most exorbitant compared with that of the De Laval.

And there is no reason why you should let its FIRST COST stand in the way either, because the De Laval may be purchased on such liberal terms that it will actually pay for itself out of its own savings.

GRANDSONS OF TILLY ALCARTRA

We now offer two young bulls for sale that are old enough for service. No. 1—Born Sept. 13, 1915.

Prince Alcartra Korndyke.
Best bred son of Tilly Alcartra.

His Dam is a 21-25 4-yr old, sired by a son of Beryl Wayne Korndyke, who has two 30 lb. daughters. His full sister has a record of 18.56 lbs. butter in 7 days at age of 2 years 3 months and will be kept on test for the year.

No. 2—Born Sept. 3, 1915. His dam is a heavy producer and will be put on test next time she freshens. His full sister has a record of 19.36 in 7 days at 2 years 6 months and will also be kept on test for the year.

The bulls are nicely marked, have perfect top lines, are good individuals and both sired by Prince Alcartra Korndyke, who now has 6 A. R. O daughters and more coming.

Write for prices, or better come and see them.

CREAM WANTED

Ship to a House of Known Financial Responsibility.

Write Us, and We Will Send You Regular Weekly Quotations

Western Meat Co.
Creamery Dept., San Francisco.

Starts Conservatively With Cheese.

[Written for Pacific Rural Press.]

If one is in a position to make good cheddar cheese he can afford to pay six cents above the San Francisco butter quotation for milk delivered at his plant and return the whey to his customers free of charge.

Such was the conclusion of D. M. Campbell of Solano county early in January after a month's experimenting with a small, poorly-equipped factory.

Not being thoroughly acquainted with the manufacture of cheese Mr. Campbell had purchased a small outfit having a capacity of 1200 pounds of milk daily. Then he hired an expert cheese maker from the Northwest, realizing that more than half the battle with good cheese was in the cheese-maker. At the time of our visit the vats were set in the tank-house and the pressing and curing shelves in a small room adjacent to a buggy shed, so the reader may know how little expense was involved. But this was to be done away with and a factory with vat capacity of 5000 pounds of milk

daily constructed at an early date.

Mr. Campbell's experience has taught him that the maximum amount of cheese from a quantity of milk containing a pound of butterfat can be obtained with a 3.8 per cent milk and standardizes to that test. But this has nothing to do with the price paid dairymen, as they are paid on a butterfat basis and some of their tests run over 5 per cent.

With milk testing 3.6 per cent the six cents above butter quotations allows the dairyman \$.12.3 per gallon for his milk; also his whey which is worth 10 to 15 cents a hundred for hog feed. The usual price for 3.6 per cent milk sold by dairymen in the district to city dealers is 14 and 14½ cents per gallon, but more labor is involved in the latter method and no calf or hog feed is provided. If the whey is fed fresh in clean utensils it makes a good calf feed, although more has to be fed than is the case with skim milk, according to Mr. Campbell.

What Became of the Champion Steer.

To the Editor: To settle an argument, can you tell me about California Jock, the grand champion steer at the International Livestock Show? How is it that he sold for \$1.75 per pound on foot? I saw the meat, that is, a quarter of it. Would they be able to sell the meat for less than \$1.75 per pound after killing and cutting up, and why? What would the shrinkage be with a steer fed the way he was?—O. A., German-town.

It is the custom of large packers to buy grand champion steers at the big shows for the advertising they receive as a result of such purchases. In this case the California steer was purchased by a packing house in Detroit, Michigan, for \$1960, who resold the carcass, after dressing, to a retail grocer for \$1,150.50. The grocer in turn retailed him at \$1.50

per pound, he also sustaining a loss for the advertising value of the venture. The steer was delivered dressed to the grocer weighing 767 pounds, showing a shrinkage of 31.6 per cent. You will understand of course that there is but one International Livestock Show champion steer a year, and the price he sells for depends entirely upon his prospective advertising value to packers. If you saw a portion of him dressed you were a long ways from California at the time, although we suppose local butchers in many towns of the country worked off nondescript steers onto their customers, as a part of the grand champion, during the holiday season. For a California butcher to claim such distinction is amusing, to say the least.—Eds.

Knife vs. Iron for Docking Lambs.

[Written for Pacific Rural Press.]

One of the interesting demonstrations at the University Farm during the annual meeting of the Cal. Wool Growers' Association was a comparison of methods in docking lambs. A knife was used in the first test to show the old method of cutting the tail and the resultant loss of blood. While the blood lost, as a rule, is small, it was related by practical sheep growers present that this loss invariably checks the growth of lambs and in some cases results in death from bleeding.

Next the docking tongs were used. The principle of these tongs is to burn the tail off, searing the flesh and skin over to avoid bleeding. While superior to the knife in results it was claimed that too much time is required where large numbers are being docked, as both hands are needed to operate the tongs.

The last test was made with the Ellenwood iron, a round iron with a thin chiseled end. This also burns through the tail, much quicker than the tongs, however, and is operated with one hand. Those present who

have used this iron were high in its praise, as experiments with twin lambs have shown a decided difference in weight where one was docked by iron and the other by knife, and operation of it is both quick and sure.

The best age to dock was stated to be when lambs are 10 to 12 days old, preferably in early forenoon or late evening.

FROSTED ALFALFA AND LIVESTOCK.

To the Editor: What effect has the feeding of frosted alfalfa on livestock?—G. E. M., Dixon.

[Answered by J. W. Benoit, Modesto.] I have found no ill effects in feeding frosted alfalfa to stock unless the alfalfa becomes moldy, and then it is liable to cause abortion in cows.

The Oakland Meat Co. have recently shipped several carloads of their feeder cattle from Gonzales, Monterey county, to Oakland. The cattle were fattened on beet pulp and beet tops.

Wash the horses' shoulders in cold water to prevent galled shoulders.

Have the whiffletrees wide enough to protect the horses' legs from the traces.

Hillcrest Stock Farm

Shorthorn Cattle, Shropshire and Merino Sheep

King Lancaster, sired by King Edward, grand champion bull State Fairs, 1909-10-11.

Shorthorn Bulls for Sale, sired by such noted bulls as King Lancaster, Knights Perfection, Greenwood Knight and Greenwood King. Nearly all offsprings of the famous King Edward.

These Bulls are conceded to be the best offering ever made from the Hillcrest Stock Farm.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING.

A new creamery, to cost \$20,000, will be erected at Lemoore, Kings county at an early date.

The Tipton, Tulare county, creamery has been reopened as a receiving station for sweet cream.

Of the 246 dairy cows tested for tuberculosis by deputies of the State Veterinarian, nine and seven-tenths per cent were reactors.

Kings county sold during 1916 4,000,000 pounds of butterfat for about \$2,000,000, and hay to the extent of about \$1,400,000.

There were seven silos erected on dairy farms adjacent to Biggs, Butte county, last year. The owners of all of them report entire satisfaction.

There were 65 cows in the Stanislaus County Cow Testing Ass'n that produced over 45 pounds of fat during the month of December. There were 21 owners on the honor list.

The Holstein-Friesian Ass'n has advised the secretary of the Butte County Spring Exposition that it will again donate a silver cup, valued at \$50, for the best exhibit of Holstein cattle.

An enthusiastic meeting of dairymen was held at Galt last week by members of the Northern California Milk Producers' Ass'n who are endeavoring to get all of the milk producers of the valley into a marketing association.

The seven-day record for butterfat has been broken by the Holstein cow Segis Fayne Johanna, according to word received from Malcolm H. Gardner. She produced 722 pounds of milk containing 40,544 pounds of fat. This is equivalent to 50.68 pounds butter on the 80 per cent basis.

The Churchill Creamery Co. of Fallon, Nevada, announce a premium on butterfat of one cent a pound for cream testing 30 per cent or better. It is probable that this is a step toward cream grading which has been so long advocated by far-seeing California dairymen and which is now being practiced in many districts.

The high score for butter in the California Butter and Cheese Scoring Contest conducted by the University of California for the month of December was made by H. C. Watson of the Alturas Creamery, whose butter scored 94 1/2 points. There were 24 entrants whose score was better than 90. C. Kolback, cheese maker for the Henderson Co. at Galt, had the highest scoring cheddar cheese with a score of 93 1/2 points.

Among other things which the California Holstein Breeders' Ass'n will aim for after their reorganization committee has completed its work will be proper representation of the association in the Holstein-Friesian Ass'n of America. Secretary-Treasurer K. Abbott of Milpitas advises us that a membership campaign will be started at once and that he will be glad to hear from all breeders not at present members.

SWINE.

J. P. Williams of Imperial county has recently received from Ohio a choice Duroc sow, said to have cost him \$800.

H. A. Smith of Imperial county has just received a shipment of purebred Berkshires which he will use for foundation purposes.

A prominent San Francisco packer states that more good hogs were received from California points during 1916 than in any previous year on record.

Kings county continues to be a heavy shipper of hogs to the San Francisco market. Packers state that not only are arrivals from there large, but exceedingly good as well.

S. G. Owens and Son of Madera have recently purchased two registered Duroc gilts from L. D. Collins of Denair, also a Duroc boar from the University Farm herd at Davis.

We are advised by Jas. J. Doty, Secretary of the National Swine Growers Ass'n, that the 1917 National Swine Show will be held at Omaha Oct. 3 to 10. Additional show ring facilities are to be provided as well as extra exhibit barns.

R. K. Walker, of the firm of Peters, Lamson and Walker, advises us that they have recently imported from Middle Western breeders two choice Duroc gilts, bred to Critic B and King of the Col. respectively. He says his firm is now turning out 500 pigs a month from their grade herds and that this number will be increased when their 400 gilts farrow.

BEEF CATTLE.

The Frank Meacham Est. advise us that they have recently sold two Red Polled heifers and a bull to Chas. Patterson of Redding and two heifers and a bull to J. W. Rush of Pendleton, Oregon.

Bessie B. Ware of Butte county advises us that she recently sold three Aberdeen Angus bulls to W. Hughes of Lincoln. She also states that they expect to exhibit Angus cattle at the next State Fair.

By the purchase of 1600 acres of range land in the Cathay Valley of Mariposa county H. W. Cornett and Sons now have a total of 6500 acres of land in the Cathay district. They will enlarge the size of their beef herd.

Cold weather is seriously affecting cattle growers in many districts, as is evidenced by a report from Mendocino county that stock men are feeding hay, and a report from Butte county saying that conditions are no better there.

We are informed by David J. Stollery, Secretary of the newly formed California Shorthorn Breeders' Ass'n, that a meeting of the directors of that association will be held in San Francisco, Monday, January 22, to perfect by-laws and constitution and arrange for the future work of the association.

Luis Terrazas, the aged cattle king of Chihuahua, Mexico, and the Creels have purchased extensive ranch holdings in the northern end of the Imperial Valley and will use it for fattening ground for cattle from their ranches in Chihuahua and New Mexico.

David J. Stollery, manager of the Paicines Ranch in San Benito county, advises us that he has sold almost 150 head of bulls since the first of September. The dam of the grand champion steer, California Favorite, was bred on this ranch and Mr. Stollery is naturally proud of the University's winnings at Chicago.

W. E. Premo, in charge of the cattle feeding at the property of the Porterville Alfalfa Company, where 1000 head of steers and calves are being finished for the market, has started feeding cocoanut meal as a part of the ration and thus far the experiment indicates that this is a valuable addition to alfalfa and

ground barley in forming flesh rapidly.

The Lux Dividend Lands, Inc., has conveyed to Martin Griffin Co. 8264.24 acres and to Reynolds Land and Cattle Co. 8077.04 acres lying about fifteen miles east of King City in Monterey county. The land includes the southern part of San Lorenzo or Peach Tree grant and township lands adjoining. This particular range has the reputation of turning off fat cattle earlier than any other locality in the State. The transaction involves about \$100,000.

SHEEP AND WOOL HAPPENINGS.

The Widemann Goat Milk Co. near Kings City have enlarged their herd of milch goats from 1,000 to 1,600 head.

W. H. McAlpine recently shipped 4200 head of sheep from Sutter county to the San Joaquin valley because of feed conditions.

Because coyotes have become a serious menace to sheep men in the island district of San Joaquin county the supervisors have offered a bounty of \$2.50 for each coyote scalp brought in.

The Frank Meacham Est. reports the sale of 20 Shropshire ewes to the Bridgeford Co., Knightsen, Contra Costa county, and a carload of Merinos to M. E. Curtiss of Lone Pine Inyo county.

It is estimated that 30,000 head of sheep will be fattened at the Visalia Sugar Company's plant this season by the Western Meat Co. of San Francisco. The first 12,000 are about ready to be turned off now.

It was the consensus of opinion at the meeting of the California Wool Growers' Ass'n held at Davis last week that wool would reach a 30-cent basis this spring. Several stated that they had secured almost 30 cents for their spring clip last season.

According to Frank J. Hagenbarth, president of the National Wool Growers' Ass'n, there is a decrease of 30 per cent in the sheep population of the United States at this time because of uncertainty of the future wool markets, adverse legislation to the Western flock master and dogs and disease in the Middle Western States.

A report from Livermore states that lambing has already commenced on the Corral Hollow ranges and while the weather has been stormy it has not been cold. Feed conditions are reported fairly good and good percentages of lambs are looked for. Among others who have taken their bands into this district for lambing are Bishop Bros. of San Ramon, who also have a choice flock of purebred Shropshires.

A London consular report says that no wool of the 1916-17 clip consigned to the United Kingdom from Australia or New Zealand on growers' account may be offered or sold except to the director of army contracts. All persons who control stocks of wool of this description must send particulars to the director of army contracts and sell such wool as may be required by the director of army contracts.

A very fine clip of Merino wool grown in South Africa was recently sold on the London market at record prices. This clip consisted of 19 bales of super hoggets for which 38 cents per pound was paid; 8 bales of ewes, 6 bales of wethers, and 2 bales of stud, all of which were sold at 37 cents per pound; 3 bales of 11 months selling for 32 cents, 1 bale of 6 months selling at 25 cents, 3 bales of backs and bellies at 25 cents and 2 bales of locks at 14 cents.

MISCELLANEOUS STOCK NOTES.

The Secretary of Agriculture has materially reduced the amount of land that may be grazed in Lassen National forests.

Rumor has it that a packing establishment will be erected at an early date at some point in the Imperial Valley. No names are given in the report.

The Tulare County Stock Breeders' Ass'n will hold a meeting shortly to adopt by-laws and constitution and formulate plans for a county fair late this year.

HIGH STANDARD FOR TULARE ASSOCIATION.

That the butterfat standards in cow-testing associations are being materially increased is demonstrated by the following report of Chas. Klint, Secretary of the Tulare Cow Testing Ass'n, for the month ending December 31. Only those cows that produced 50 or more pounds of fat are given.

Owner	Pds. Milk.	Pds. Fat.
W. J. Higdon (H.)	2534	98.83

E. L. Thomson (H.)	1401	50.44
Chas. Holmes (H.)	1429	50.02

There were 28 cows in the association that produced 45 pounds or better during the month.

HUMBOLDT DAIRYMEN MEET.

The fourth annual meeting of the Humboldt County Dairymen's Ass'n was held at Ferndale, Jan. 10, over 300 being present. Prof. F. W. Woll of the University of California was the chief speaker, his talk being chiefly confined to the feeding of dairy cows and more particularly to the California Dairy Cow Competition. In his annual report Robert Fowler stated that there were approximately 200 members in the association at this time. Officers for the ensuing year were elected as follows: President, G. M. Fulmore; first vice-president, J. W. Coppini; second vice-president, Bernard Crowley; secretary and treasurer, Robert Flowers; trustees Alex Aggeler of Ferndale, C. S. Rasmussen of Loleta and G. W. Trigg of Ferndale.

HORSES AND MULES.

REGISTERED SHIRES—Black Hawk Stock Farm, Importers and Breeders, Easton & Ward, Promoters, Burlingame, Cal.

REGISTERED IMPORTED PERCHERON Stallion for sale cheap. Hewitt & Hewitt, Dixon Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT Co., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreet, or San Francisco banks. Office, 319 Underwood Building 525 Market St., San Francisco.

LIVE STOCK INSURANCE—Registered live stock and farm work horses should be insured. The Hartford Company, strongest in the world, writing live stock. No trouble to answer questions. D. O. Lively, special representative 215 Hobart Bldg., San Francisco.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Cal Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

FOR SALE—450 stock pigs, average weight sixty pounds. Address D. O. Lively, 215 Hobart Bldg., San Francisco.

The Tale of "Razor" and "Chunk."

(Continued from first page.)

Razor Is Weighed.—All of the other work had been preliminary so far as we were concerned, for this was to be the acid test of Razor's life. Soon we were to learn just how much edible pork there was in each 100 pounds of Razor when she was alive. Neither the farmer, local buyer, yard foreman or packing house superintendent could have told us absolutely, before this final weighing her actual worth in dollars and cents. Before this it had been a guessing contest all along the line.

As her carcass neared the weigher, he hurriedly noted her "lot number" and compared it with his record sheet on which he saw her live weight of 185 pounds as furnished by the yard foreman. The scales balanced at 120 pounds, showing that Razor had lost exactly 65 pounds of weight in her short visit to the packing house. Now a rapid calculation showed that this 65 pounds represented a 35 per cent loss of weight, so far as edible meat was concerned, a shrinkage far in excess of what it should be as was later shown by Chunk. And while the packer would not lose anything on Razor because of disease, he would and did lose on approximately 3 out of every 100 head of Razor's mates, and this has to be pro-rated back against her also, still lessening her value.

Chunk a Better Hog.—To be quite frank, Chunk had been selected with the hope that there would be a distinct improvement in his dressing percentage over Razor. His size and apparent quality had placed him in the "loin" or "packer" pens outside. Instead of being sold entire, to the retail butcher, it was intended that he should be cut up at the packing house; his hams, sides and backs being cured and sold as smoked meat at more than fresh meat prices.

U. S. Stops Him.—His treatment up to the time he visited the first U. S. Inspector was the same as had been accorded Razor, but a few slashes of the inspector's knife and a careful scrutiny of his glands, which did not have the right appearance, made him suspicious. As a consequence Chunk was tagged with a "retained" tag and instead of going slowly but surely toward the scale man he was side-tracked into the "retaining room" where over 200 of the 700 hogs slaughtered on that day were awaiting further inspection of intestines, liver and legs.

Here he stood a chance of being condemned outright if he were so badly diseased as to prohibit human

consumption; he could be stamped with a government stamp calling for "sterilization" (a process of cooking which kills all tubercular germs, after which the meat is allowed to be sold canned in various forms) or he could be passed as government inspected and free from disease if no signs of disease were found, other than in the glands.

More Pork in Chunk.—Fortunately, Chunk was passed out of the retaining room as healthy, on to the dressing floor, where, instead of three pounds of leaf lard, he yielded five and a half pounds, worth at present 16 cents a pound.

Again we made our way to the scales to watch Chunk's final weighing. Again the checking-up was done, but this time the scales balanced at 197 pounds, showing a loss of 53 pounds during Chunk's few minutes in the building. At a glance we perceived that the percentage of edible pork in Chunk was much more than had been found in Razor, and by simple arithmetic we found this amounted to 78.8 per cent. Analyzed this meant, then, that while but 65 pounds out of every 100 pounds live weight in Razor were suitable for human consumption, 78.8 pounds of Chunk from each 100 pounds was edible, a difference of 13.8 pounds on each hundred in favor of Chunk.

More Profit in Chunk.—The price paid for "shipper" hogs that day was 8½ cents per pound and for "loin" hogs 9½ cents, making the total cost of Razor, live weight, \$15.72 and of Chunk, \$23.75.

To determine which hog's carcass had cost the least per pound we divided the cost of each animal, live weight, by the number of pounds of dressed meat in each carcass and were surprised to find that each pound of dressed meat in Razor's carcass had cost \$.131, while the cost per pound of dressed meat in Chunk was but \$.12. But to further handicap Razor in the packer's eye we were told that there was approximately one cent a pound difference in the selling price of dressed meat of the two carcasses, this also being in Chunk's favor.

Here, then, was our conclusion: Razor, and her thousands of brothers and sisters which still consume much good feed on California farms, was unprofitable to the farmer, the local buyer had a hard time getting rid of her and the packer, with all of his modern methods, could not make her as profitable as her aristocratically bred mate.

How to Rid Sheep of Worms.

Digestive disturbances, poor appetite, loss of flesh and general weakness of sheep indicate the presence of worms. Lambs are most seriously affected, the experts say. Ridding the sheep of worms in the spring will result in fewer losses in the lamb crop.

Sheepmen having flocks infested with stomach worms and tapeworms may free the animals of such pests by a drench of copper sulphate which has been found most satisfactory in the flocks at the Ohio

State Experiment Station.

Two fluid ounces of a solution made by dissolving an ounce of copper sulphate (blue vitriol) in two quarts of water is sufficient for a yearling; and a two-year-old sheep needs three fluid ounces. A long-necked bottle or a rubber tube and funnel may be used to give the dose. Most effective results follow when the sheep are fasted for a day both before and after treatment. Water should not be given for a few hours preceding and following the dose.

Are Your Cows a BURDEN?

Many cows are a constant drag on their owners when they could just as well be good producers—if properly handled.

Don't forget that your cows can get physically "off color" just as you sometimes do. Watch the milk yield; if it is going down without apparent reason, something is wrong with the cow. Overfeeding is likely to make the condition worse; she needs a medicine that will clear up and strengthen her organs of production.

Kow-Kure is making thousands of new friends among the best dairymen every year, because it supplies this great need. It is a cow medicine, pure and simple—not a food. It has great curative and tonic powers that immediately act upon the digestive and genital organs and enable the cow to thrive on her natural food. Kow-Kure has back of it twenty years of success in making backward cows profitable and in the prevention and cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Scouring, Lost Appetite, Bunches and other common ills.

You can buy Kow-Kure from the best feed dealers and druggists. Sold in 50c. and \$1.00 packages.

BASSETT'S POLAND CHINAS

GRAND CHAMPION Sow.
P. P. I. E. 1915; Sacramento 1916.

For many years, at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large, and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Raising Poultry for Profit

LOS ANGELES ADOPTS NEW EGG CLASSIFICATION.

With the beginning of the new year the Los Angeles Produce Exchange adopted the following new classification of eggs that is now in force on this market:

1. **California Fresh Extras.**—Color shall be entirely white and reasonably clean; the size reasonably uniform; from February 1st to July 1st they shall weigh 22 ounces and over, and average 24 ounces per dozen; from July 1st to January 31st they shall weigh 22 ounces and over, and shall average 23½ ounces per dozen; quality shall be ninety per cent fresh, sound, sweet and full; the balance, other than loss, may be defective in strength and fullness but must be sweet; maximum total loss permitted, per case, one-half dozen.

2. **California Fresh Selected Pullets.**—Color shall be entirely white and reasonably clean; size reasonably uniform; throughout the year they shall weigh not less than 18 ounces and shall average 20 ounces per dozen; quality ninety per cent fresh, sound, sweet and full; the balance, other than loss, may be defective in strength and fullness but must be sweet; maximum total loss permitted, per case, one-half dozen.

3. **Ranch, Case Count.**—Shall be fresh gathered, reasonably clean, of good average size, and may be of mixed color; must be eighty per cent fresh, not over four per cent rots, and the balance may be defective in strength and fullness, but must be sweet, and must weigh a minimum of forty-three pounds net to the case.

All case count eggs must be delivered in original condition as received from consignors, and cases must contain thirty dozen or more eggs.

POINTERS ON SHIPPING BABY CHICKS.

[By Geo. H. Croley.]

The International Baby Chick Association held its annual meeting in connection with the Palace Poultry Show in New York City Dec. 8. Among important matters considered it was urged that uniform instructions to express agents be adopted for use on all shipping labels employed by shippers of baby chickens. The following was recommended:

**LIVE BABY CHICKS.
HANDLE CAREFULLY.
DON'T THROW.
KEEP FROM HEAT OR COLD.**

**SAFETY FIRST.
RUSH DELIVERY.
KEEP LEVEL.**

DO NOT FEED OR WATER.

The above to be printed in red ink, in large, easily read type and used with the emblem on every package of baby chicks. On December 9 the Board of Directors met with the representatives of the leading express companies with a view to securing better handling of chick shipments. Attention was called to the fact that chick boxes are often roughly handled, thrown from one agent to another, dumped roughly

on one end instead of keeping level, so that chicks are crushed in one end of box. Chicks should not be left long exposed on windy platforms in cold weather, nor should they be placed close to hot steam pipes or stoves. The fact that a chick starts out on its journey with a full belly containing the egg yolk remnant and that it does not require and should not have food for 72 hours after hatching, was also explained. The desirability of routing shipments around, instead of through, greatly congested transfer points was also discussed and some cases were mentioned where losses of chicks had occurred through failure to deliver promptly. Some cases were cited where chicks had been buried under other express matter and left for several days, and others where a two-hour journey had been extended to three full days through carelessness and failure to rush delivery. The express company representatives were made aware of the association's work to secure better shipping packages, uniform instructions to express agents on labels, regulation of ventilation, use of emblem, etc. The expressmen thought the recommendations for label good and themselves recommended the words, "Don't Throw," which have been added to the wording first proposed. Hearty co-operation was promised by the express companies.

HIGH RECORD HENS PROBABLY ACCIDENTS.

To the Editor: Some time last year I saw an interesting report on an egg-laying contest carried on by students of high schools in California. The article stated that the highest score was made by a pen of cross breed hens of Rhode Island and Brown Leghorns. Can you kindly tell me how this cross is made to get the best egg-producing results: i. e., from which breed is the cockerel selected?—E. W. H., Tempe, Arizona.

[Answered by Geo. H. Croley.]

Our correspondent evidently intends to state that these fowls were awarded the highest prize as Utility fowls or that their records for egg production was the best. The extraordinary results from the cross breeding referred to was probably an accident. Most likely it just happened that the male bird was from a mother of remarkable laying capacity, while the hens were unusually vigorous and capable of digesting large quantities of feed with

which to produce the eggs. Because they were a cross of Rhode Island Reds and Brown Leghorns is no guarantee that the same results will be gained by a similar cross unless the breeder properly selects his fowls. In nearly all cases better results are gained by breeding pure-bred fowls. In making a cross of breeds of considerable difference in size it is usually considered better to use a male of the smaller breed.

Send For A Sample Of Calmade Graduated Poultry Fence

10 inches graduated in mesh from ¼ inch to 1½ inches then 20 inches of 2¼ inch mesh, topped by 4½ inch mesh for the height of the fence.

The Fence Without a Sky Line

It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, large fowls can't climb it. "CALMADE GRADUATED" Fence will not slip at the joints nor unravel when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or bend on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

E. H. EDWARDS COMPANY

SUSAN SWAYSGOOD

Route 2, Pomona, Cal.

Wonderful Egg Producer.

Any poultry raiser can easily double his profits by doubling the egg production of his hens. A scientific tonic has been discovered that revitalizes the flock and makes hens work all the time. The tonic is called "More Eggs." Give your hens a few cents' worth of "More Eggs" and you will be amazed and delighted with results. A dollar's worth of "More Eggs" will double this year's production of eggs, so if you wish to try this great profit-maker, write E. J. Reefer, poultry expert, 4801 Reefer Bldg., Kansas City, Mo., who will send you a season's supply of "More Eggs" Tonic for \$1.00 (prepaid). So confident is Mr. Reefer of the results, that a million-dollar bank guarantees if you are not absolutely satisfied your dollar will be returned on request and the "More Eggs" cost you nothing. Send a dollar today or ask Mr. Reefer for his Free poultry book, that tells the experience of a man who has made a fortune out of poultry.—Advertisement.

California Poultry Practice

A Practical Treatise on Poultry Raising in California

By Mrs. Susan Swaysgood

Writer and Breeder
Of Utility Poultry.

160 pages of text, besides many full-page illustrations.
Cloth bound.

This Book Will Help You in the Many Details of
POULTRY RAISING.

In writing this book, the author, after a lifetime of active, practical and successful experience in poultry raising on the Pacific Coast, has endeavored to show the farmer how he can make the poultry department of his business more profitable. It deals with actual conditions—not theories—and covers every phase of the industry from eggs, chicks, disease and remedies to the profitable marketing of the products of the poultry farm.

HATCHED CHICKS from Barred Rocks. R. I. Reds, White Leghorns. Good stock. Send for circular. G. L. Hawley, Madera, Cal.

PUP SUCKS EGGS.

To the Editor: Do you know of anything to break a young pup from sucking eggs?—M. B., Warm Springs.

We remember with a rather cruel pleasure how as a boy we broke a hen from eating eggs. We purchased a hole in the end of one big enough so some of the contents would spill and attract our egg-eater. Plenty of red cayenne pepper was allowed to permeate the egg, then it was put where she would get it. With great satisfaction the boy soon saw the hen running madly about the yard with her mouth wide open, cooling it off. She became a model of good behavior forever after.

COMMON HENS LAY.

To the Editor: I just now read what H. G. W. has to say about his pullets not laying, and would like to add my experience: I have eleven pullets, three hatched in January, the other eight hatched in March. They are a mixture of almost everything, perhaps a little more Wyandotte than anything else. Since the first of October I have been getting six to nine eggs every day. I feed bran mash, wet with milk in the morning, table scraps at noon, and whole corn at night; they have free range. I have been raising chickens twenty-five years, have had in all fourteen different breeds of pure-bred fowls. Have never had any do better than these barnyard fowls. Ukiah. Mrs. Fred Smith.

THE VALUE OF DRIED FISH.

To the Editor: What is the value of dried fish for chicken feed, and is there a ready sale for same?—Reader, Madison, Cal.

[Answered by Geo. H. Croley.]

The feeding value of dried fish when used as poultry feed depends on how it is handled in the process of drying. If not properly prepared it is dangerous to feed it. Fresh fish that has been correctly handled and has had most of the oil and water removed is worth approximately the same as good dried meat scrap. Fish meal is used by many poultry keepers and, if good, meets with ready sale.

EASTMAN'S BRED TO LAY Barred Plymouth Rocks, Chicks, Cockerels. Fairmead Poultry Farm, Fairmead, Cal.

LARGEST EGG—WHITEST FLESH—Black Minorcas, \$1.50 per setting 15 eggs. Edward A. Hall, R. F. D. 1, Watsonville, Cal.

Mrs. Best's Letter.

My Dear Friends: As soon as we enter the New Year, the smart shops begin to show new spring garments. Not for wear here, but for island wear or other warm resorts.

Sport garments reign supreme and are shown in a great variety of materials—light weight Bolivia cloth, fancy velours, silk and wool jersey, tussah silk and smart checks.

As is usual in the early spring, bright and striking colors seem to predominate, although in crepe de chine dresses (which are very smart indeed) white and flesh color are very popular. These dresses are very simple in design, the skirts being full and falling in straight lines, while the waist is a simple blouse effect with a soft wide girdle.

Perhaps the newest note in the spring dresses is the mandarin sleeve, which is very effective in soft materials.

The hats for wear with these garments are many of them combinations of satin and straw, or silk and braid in high colors and the new ribbon hats in white or soft shades. These hats are rather high-crowned and narrow-brimmed with the exception of the large straw sailor, which comes to the front each spring as regularly as the season arrives.

Many designs in separate sport-skirts are shown and for wear with them, the Georgette and crepe de chine blouses are leading in popularity. One cannot help but hope that they will stay with us forever, for they are so much more satisfactory than the lingerie blouse. They are some of them quite tailored except for a little bit of hemstitching and others are embroidered in silk or bead-trimmed.

Shoes continue high in cut as well as price and are in many color combinations. But it is a little early to know what will be the best conservative styles for our own spring wear. Sometimes the very early styles in hats and other spring apparel are extreme and do not last on into the summer.

Most of us are really more interested in the wonderful clearance sales of seasonable goods and household furnishings than anything else. The opportunity to buy under the market price of linens, underwear, bedding, etc., appeals to all thrifty housekeepers. These sales continue this entire month. *Rosabella Best.*

SIMPLE RULES FOR GOOD COCOA.

Cocoa or chocolate, ground or shaved from the cake, unsweetened, sweet or milk, all make a good drink. Add sugar and mix to a paste with warm water. About one tablespoon will make a medium strong drink. Add water to make one-half cup for each cup desired and boil for a couple of minutes. Then add hot milk and serve with whipped cream if possible. A marshmallow is a delicious addition, or a dash of vanilla or ground cinnamon. If egg is used, beat thoroughly and blend carefully just before serving. For delicious iced cocoa make the syrup stronger and add a pinch of salt. When ready to use, pour over cracked ice (if possible) and fill up the glass with all milk or part milk and water and top with whipped cream.

THE HOME CIRCLE

LAUNDRY HINTS.

When washing flannels try to get rid of as much dust and dirt as you possibly can by shaking and brushing well before plunging into water.

High temperature has a tendency to shrink wool fiber, therefore the water in which woolen articles are both washed and rinsed should be warm enough only for the hand to be borne comfortably in.

Spots on towels will disappear if a little ammonia is put into the water to soak the articles. Put a teaspoonful into the water in which dish towels are put to soak—then wash well in a good suds. Rinse thoroughly and the towels will never look dingy.

A good starch polish is made by taking one ounce of white wax and one ounce of spermaceti, melting and running it into a thin cake on a plate. A small piece of this added to a quart of prepared starch, gives a fine luster to the clothes and prevents the irons from sticking.

HINTS TO HOUSEKEEPERS.

A dish of water placed in a hot oven where pies, cakes or puddings are being baked will prevent scorching.

A nail or tooth brush should never be left in water or the bristles will soften. Hang on hooks or place in racks.

Mend gloves with cotton thread instead of silk as the silk is apt to cut the kid. If mended from the wrong side, they will present a neater appearance.

Bread jars should be scalded out twice a week to keep away the mold.

Gelatine puddings should be carefully covered while cooling as gelatine has a particular affinity for germs.

An omelet pan should be rubbed clean with paper and a dry cloth instead of washing. If the pan is treated this way, the omelets are not so likely to stick.

SEWING MACHINE HINTS.

The breaking of needles and cotton are of common occurrence, but in most cases they can be avoided by adjustment of the needle. Coarse cotton must not be used with a fine needle or the needle is forced out of the run, in the way of the shuttle. If the feed is not doing its work, do not attempt to aid by pulling the material through or the needle will be pulled out of position and broken. The feed probably is too low and needs raising.

Before beginning to stitch, be sure the needle passes through the needle plate freely, not striking the side of the opening.

If the machine runs hard and noisy, if ordinary oiling does not relieve it, use gasoline freely around the working parts and then after dry-

ing, follow with a free use of a good machine oil. This should be done when the machine is not to be used on delicate materials for the oil is in evidence for some time, even after careful wiping.

FLOORS AND THEIR COVERINGS.

The sooner all nailed down floor coverings are replaced by rugs the better, for carpets which cover a whole floor are very hard to clean. Rugs collect just as much dust and dirt, but they can be taken out and swept and the floors kept in a more sanitary condition.

A soft wood floor can be made to look reasonably well by using a crack filler and painting it well. Then varnish it and it can be kept in good condition by using an oiled mop if the places where the most travel comes are protected by rugs. A varnished floor may be made more durable by waxing. The wax protects the floor from marring from heavy shoes. The method of applying is the same as on a hardwood floor.

TO CLEAN IRON WARE.

If not rusty, washing with a weak soda water and hot soapsuds will be sufficient. For rusty sinks or kettles, rub the inside with mutton fat, free from salt, and sprinkle with powdered quicklime. Let remain over night and wash with brush and hot soapsuds. Rinse thoroughly and dry. Rust may also be removed with powdered emery and benzine. This must be applied to a cold surface.

BUREAU SET.

Filet crochet makes very attractive bureau sets. A linen center or runner may be used with crochet edging all the way around, or perhaps just a wide band at either end, with the linen hemstitched all around the four sides. In either case, the pattern of the lace should be copied for the pin cushion top, cases for talcum powder and cologne bottles.

EGG AND CABBAGE SALAD.

Cut the whites of three hard-boiled eggs in small pieces, crumple the yolks with a fork or by pressing through a sieve. Have ready 1½ cups cabbage finely chopped, sprinkle with salt, pepper and 1 teaspoon celery seed or salt. Mix the cabbage lightly with the eggs, add the dressing, tossing until well mixed. Arrange on beds of lettuce or serve in small cup-shaped cabbage leaves.

Northern Visitor (in Georgia): "I see you raise hogs almost exclusively about here. Do you find they pay better than corn and potatoes?" Native (slowly): "Wal, no; but yer see, stranger, hogs don't need hoeing!"

ORIENTAL PUNCH.

Make a syrup by boiling 1 cup each sugar and water for six minutes. Add 6 cloves, 1 stick cinnamon, ½ teaspoon chopped Canton ginger. Cover and let stand until cold. Add the juice of 3 oranges and 2 lemons. Strain and add a little green coloring and 1 drop oil of peppermint. Let stand 1 hour. Pour into punch bowl and garnish with mint leaves when filled with water to taste.

Floral Department.

By Geo. N. Tyler.

Classification of Plants.—The first class is the annuals—those which grow up from seed, flower, ripen seed and die in the course of one season. They are divided into three classes—the hardy, which are sown at once in the ground they are to occupy (such as sweet alyssum); the half hardy, which succeed best when aided at first by a mild hot bed or green house and then transplanted into the open air (such as asters); and the tender, which are kept in pots and treated as greenhouse or stove plants, to which department they properly belong. Hardy biennials live as undeveloped plants through our winter period. They require to be sown in the summer and fall months in order to get well established before winter, and bloom and die the following year.

Hardy Perennials.—This term includes not only those fibrous-rooted plants of herbaceous habit, which spring up from the root year after year, but also the hardy bulbs.

Greenhouse Plants.—These are plants requiring the shelter of a glass house provided with a moderate degree of heat, of which 35 degrees may be taken as the minimum. The house should be opened for ventilation in all mild weather in winter and daily throughout the rest of the year. (Among this class are the begonias.)

Stove Plants.—Two houses are required wherein different temperatures can be maintained. The temperature during winter should range at night from 55 in the cooler, to 65 in the warmer, and from 65 to 75 degrees by day, allowing a further rise of a few degrees by sun heat. In summer the temperature may range ten degrees higher by artificial heat, night and day, and will often by sun heat run up to 90 or even 95 degrees, beyond which it should be kept down by ventilation. During the growing period the atmosphere must be kept moist by dampening the walls and pathways and by spraying the plants according to their need. When growth is completed less moisture will be necessary, and in ventilating cold draughts must be avoided. Among this class of plants are orchids, caladiums, coleus, adiantums (maiden hair ferns) and this is the reason so few can grow the maiden-hair fern as a house plant.

Now I have given you the soils and classes of plants, and in the future when I describe a plant, you can easily mix the right soil. I will also classify the plant so you will know what treatment to give it.

FLORAL EMBLEMS.

Most countries have a flower for a national emblem—the United States having the golden rod; England, the rose; Ireland, shamrock; France, fleur-de-lis; Japan, chrysanthemum; Canada, maple leaf; Holland, tulip; Scotland, thistle; Germany, corn-flower and Switzerland, edelweiss.

Cleaning Books.—If the leaves of a good book become soiled, sponge lightly with a clean cloth dipped in benzine. This must be done in a room without a fire.

OUR BABY.

Who is the king who has no crown,
Though he is dressed in a velvet
gown?
Ever since first to town he came
Every one's loved him,—what's his
name?
This is His Majesty, and his suite
All in a court dress nice and neat.
Whenever to hold his court he goes,
They follow his ten wee toddling
toes.
His scepter's a rattle, I must own;
Mother's lap is his nicest throne;
His army's tin and his navy's wood;
His subjects love him, he's so good!
Where is his kingdom? Don't you
know?
Why, in the hearts that love him so,
Though he is only a baby small,
He is a king, so say we all.
—F. Gray Severne.

THE LETTERS TO GREAT-
AUNT LYDIA.

"I don't see why we have to write to her," complained Betty, as her mother left the room. "A great-aunt seems so far away—not like a near, common aunt."

Robert frowned as he drew two chairs slowly toward the desk. "I shouldn't think she would like little-boy-and-girl letters," he said. "We can't write anything interesting. She never laughs."

"Of course not," agreed his sister. "She's too old."

Robert smiled. "Why, no, she isn't. Grandpa is eighty-five and he laughs all the time. It's fun to write to him."

Betty was always inventing games. "Let's pretend we are writing to grandpa," she cried excitedly, "only begin Dear Aunt Lydia." Then we'll have time to write the real letters. It's raining harder than ever. Let's write the make-believe letters with pencils."

"No, let's write with ink. Miss Thompson says we ought to be particular in everything we do." Robert's black eyes were very earnest.

"All right," said Betty. My teacher is particular about letters, too."

Soon two little heads bent over the low, wide desk in the corner of the library and two pens kept merry time to the patter of the raindrops. At last the letters were finished.

"Read yours first," cried Betty, tossing the brown curls from her shining eyes.

Robert stood by his chair, just as he did at school, and read:—

"Dear Aunt Lydia,—You would be surprised to see how tall Betty is. If I didn't drink a quart of milk a day she would catch up with me. I think that brothers ought to be taller than sisters, don't you, Gra—Aunt Lydia?"

"I have a good joke on Betty. You know how afraid she used to be of caterpillars. Last month, in our plum-tree, I found the loveliest great caterpillar, all green and covered with red, yellow, and blue tubercles. Miss Evans said we might call them spines now, but we told her we liked hard words. I kept the caterpillar in a box and fed it plum leaves. Betty would just peek over the edge—then jump back and scream. But one day I caught her looking into the box five minutes. When I crept up to her she screamed and looked kind of ashamed, but after that we would watch the caterpillar together. It was lots more fun. When it spun a big cocoon we wrote Miss Evans about it, and she said, if nothing happens, we would have a lovely big

cecropia moth next spring. Betty and I can hardly wait.

"I wish you would write me about your parrot. Has it learned any new words?"

"Your loving nephew,
"Robert T. Foster."

"That's lovely," cried Betty. "I don't care if you did tell about me. Now hear my letter."

"Dear Aunt Lydia,—I wish you could see Juliet, my dear, little gray kitten. Robert loves it just as well as I do."

"Father's Cousin Ellen came last week. Mother said I must not talk much about Juliet while she was here for she didn't like cats. I don't see how she can help it, but mother says folks are not all made alike. When Cousin Ellen came she never spoke to Juliet and it made her feel so bad I had to take her out doors to comfort her. But what do you suppose happened one day? Mother forgot her pocketbook when we went to market, and sent me back to get it. And there on the side porch I saw Cousin Ellen petting Juliet like everything, and saying, 'Nice kitty. You are the prettiest little thing I ever saw. How you can purr!' I hurried back and told mother, and she smiled and said some folks didn't like to show their feelings. But I've loved Cousin Ellen lots better ever since."

"We enjoyed the book you sent. Mother reads it to us in our story-hour."

"Lovingly, your niece,
"Elizabeth M. Foster."

"Your letter is just as good as mine," praised Robert, "even if you aren't so old. Oh, dear, now we've got to write the real letters and it's almost stopped raining."

In an amazingly short time the "real" letters were finished. Robert jumped up to read his, for he had spied a bit of blue sky.

"Dear Aunt Lydia,—I was glad to have school begin last month. Miss Thompson is my teacher. I am in the sixth grade now, and study reading, arithmetic, spelling, language, geography, music, drawing, and nature work. We have begun fractions in arithmetic."

"After school I get in the wood and feed the chickens."

"Your loving nephew,
"Robert T. Foster."

"That's just what we always write," sighed Betty. "My letter is almost like yours. These aren't at all like the others."

"What letters?" asked mother, who was smiling from the doorway.

Robert looked at Betty; Betty looked at Robert. Then they told mother all about it.

"See, the sun is shining!" cried Mrs. Foster. "Run out and play and I will read your letters and address the envelope. You have been in the house long enough."

Three days later the children found a letter from Aunt Lydia in the post-office. Robert read it aloud on their way home.

"Dear Robert and Elizabeth,—I was feeling far from well last Monday and was about to send for the doctor when your letters came. How I laughed over the story of Juliet! You have found that Cousin Ellen has a tender heart. If you were sick she would care for you day and night. Then the caterpillar story! It carried me back to the happy sum-

"Young man, the best tonic for you is the right kind of food. I suggest for Breakfast

mer I spent hunting caterpillars, moths, and butterflies with my niece who teaches nature work in a large school.

"Don't be surprised, children, if you receive a big book about—just wait and see. You saved me a doctor's bill.

"Your affectionate aunt,

"Lydia N. Foster."

"I don't care if mother did make a mistake," cried Robert, "do you?"

"No-o," replied Betty, slowly, "only I almost wish we had invited Aunt Lydia to visit us. I never supposed tender hearts were so common."—Mary Sherburne Warren, in Sunday School Times.

HOW TO OPEN A BOOK.

Hold the book with its back on a smooth or covered table; let the front board down, then the other, holding the leaves in one hand while you open a few leaves at the back, then a few at the front, and so on, alternately opening back and front, gently pressing open the sections till you reach the center of the volume. Do this two or three times and you will obtain the best results. Open the volume violently or carelessly in any one place, and you are likely to break the back and cause a start in the leaves.

Big Ben

A
Westclox
Alarm

FIVE A. M. for factory men who beat the time clock at the works.

Big Ben gives 'em their breakfast call long before the whistle toots. They used to pound the pillow right up to the last dot—until they learned a better way—as the paymaster soon found out.

Give Big Ben a trial, yourself; make your roll-over-time pay.

You'll like him face to face. He's seven inches tall, spunky, neighborly—downright good.

At your jeweler's, \$2.50 in the United States, \$3.50 in Canada. Sent postpaid on receipt of price if your jeweler doesn't stock him.

Good Health.

(By H. E. Pastor, M. D.)

Eat, Drink, and Be Merry.

Never sit down to a meal if you feel excessively tired, either as a result of physical or mental exertion. The digestive apparatus is then in no condition for the reception of food. Better rest and relax for half or three-quarters of an hour before beginning the meal. If you ignore this simple rule, you will soon contract a bad case of dyspepsia, if you haven't already done so. Hard thinking, worry, excitement—all those things which draw an undue flow of blood to the brain (and away from the stomach) militate against good digestion. Light, entertaining conversation at the table, jovial repartee—anything which relieves mental and nervous tension—are vastly superior to pepsin or other digestive ferments to aid the digestive process. And the rest and relaxation after the meal are just as important as before it. The jester at the table of the king in "ye olden time," with his merriment and raillery, of which we read so much in Shakespeare's dramatic tales, was no idle fancy or senseless fad. The custom was founded on solid, sterling good sense. As a recent very successful advertiser put it, "There was a reason for it." There is also a hygienic reason underlying the current popularity of the musical accompaniment in the fashionable city cafe. Music to the average person, under normal circumstances, is a pleasing distraction, and better than a whole box of Dr. Bunkum's digestive wafers for digestive ills.

True, you can't have a king's jester or an orchestra, or any other form of side show as an accompaniment of the rural meal; but all of us should be resourceful enough to improvise an atmosphere of cheer and pleasantries at the meal table—that "good digestion may wait on appetite, and health on both." Good cheer not only costs nothing, but sometimes saves heavy doctor's bills.

Pain and Its Purpose.

A distinguished physician has said that "pain is a blessing in disguise." Perhaps it is, but it is one of those blessings most of us could get along without very comfortably. Many of us who have a superfluity of blessings of this kind can't properly appreciate them. However, if we regard pain in the light of a danger-signal which warns us that there is something wrong in our internal mechanism which demands attention—something which might otherwise be ignored to our detriment—we must admit that pain has its uses even if it is ungentle in its mode of operation.

Our purpose here in bringing forward this painful subject is not to abuse it or to make sport of it. Indeed, it is no joke, nor can any amount of facetious fancy make it so. What we would urge upon readers of the Rural Press is the necessity of heeding pain's warning at once. Don't wait for a second or general alarm. A fire is more easily quenched in its beginnings than when the conflagration spreads. If you have a mild toothache have the tiny cavity plugged up instead of

letting the whole tooth decay and then losing it. If there is gastric pain after eating, study your dietary at once and avoid becoming a confirmed dyspeptic with dyspepsia's long train of collateral evils. When you detect the first symptoms of the boring pain of neuralgia, stop the wear and tear on the nervous system and take a good nerve tonic. When you feel the sharp, cutting pain of pleurisy—the "hitch" when you take a deep breath—take yourself in hand at once and don't let it spread. And so with the first throbbing pains of inflammation, or the death-like knell of the pain that ushers in a heart lesion. Pain is a monitor, warning you of a wrong within. Don't ignore it. The stitch in time saves nine—indeed, in the domain of health, good and bad, it often saves a life.

If You Would Pick a Winner.

If the farmer feels that he must select some member of his family for a professional life in the city, let him not pick out the most delicate under the impression that he is too frail for work on the farm. There is nothing more devitalizing than the exactions of professional life in the city, with its accompaniments of social indulgences, late hours, and indoor confinement. The list of those who have attained eminence as lawyers, physicians, ministers, literary workers, etc., shows that, as a rule, only those who have combined great physical endurance with great mental capacity, carve out a satisfactory career. Better keep the weaklings at home, where they will have a better chance—if not for great wealth, at least for better health.

California Garden Flowers

TREES, SHRUBS, VINES.

By E. J. Wickson, A. M.

is just what you need as an aid in your every-day work in the yard. It is written by a Californian who knows, to meet your conditions. It tells the how, when, and why, and is very practical in its suggestions.

The book is divided into six divisions and these parts are divided into twenty-six chapters, which cover California conditions, cultural suggestions, California garden year, ways with garden plants, shrubs, trees and vines, methods against pests and diseases.

The work contains 258 pages of closely packed information of absolute value to plant growers, besides numerous illustrations—handsomely bound in cloth. Price, \$1.50 postpaid.

SEEDS.

There is some call for vetch, and the price of Oregon has stiffened a little, with diminishing supplies. Other lines rather quiet, though occasional inquiries are received for the sweet clovers and alfalfa for spring sowing. (Ton lots or over, to planter, S. F.)
Alfalfa, per lb. (guaranteed) 19@21 c
Oregon Vetch 4.5@5 c
Melilotus Indica 5@8 c
Melilotus Alba Nominal
Bur clover, recleaned 12 1/2 c

HAY.

Arrivals show up a little better this week, the dry weather favoring shipping, but local supplies have been getting rather low and the additional supplies have been well received by the trade. Buying in the country has been active, with some large purchases by dealers; and the rapidly diminishing supply is reflected in a general advance in the local market. Fancy wheat and oat hay is unusually strong; and there is also a large demand for the cheaper grades, causing wild oat and barley hay to stand on the same price basis as good tame oat hay.

[Prices per ton, carload lots, San Francisco.]

Wheat, No. 1 \$17.00@19.30
No. 2 15.00@17.00
Tame oats 14.00@19.00

EGGS.

The cold weather has curtailed production, and with about four carloads shipped East last week prices have naturally jumped, extras going up 7c. In the last fortnight. The Government report just out shows storage stocks for the country little over half what they were a year ago; and the California district contains 18,000 cases, against 24,000 cases last year. The local demand for cheap eggs has caused pullets to approach the price of extras very closely.

Monterey Cheese 17@19c

DECIDUOUS FRUITS.

Local storage apples are moving off well, and Newtowns have advanced. Many are going East, and there is a strong English demand, but shipping space cannot be obtained. Northern stocks still amount to about 6,000 cars, but many are now going East. They

have not been well received here, owing to small size.

Bellflower, box \$.65@.75
Newtown 1.10@1.25
Pears, Winter Nellis 2.25@2.75

DRIED FRUITS.

The interesting feature is the appearance of offers for 1917 fruit from some important local packing concerns, who are anxious to provide for next year's needs and are confident of the strength of the market. Figs especially are wanted, and offers are made of 4 1/2 c. for black, 5 1/2 c. for white, and 9c. for Calimyrnas. They are also offering 6c. for future prunes and 6c. for peaches. It is impossible to learn as yet whether much business has been done at these figures, but it is doubtful if many growers care to contract so far in advance. Spot fruits remain quiet, though inquiries are gradually increasing, and packers, who control practically all supplies, are holding very firmly. December raisin shipments were 8,000 tons ahead of the same month of 1915, despite the car shortage. The market is in very good shape. [Net to growers, bulk basis, f. o. b. shipping point.]

Apples, new crop 8 @ 8 1/2 c
Apricots, per lb. 1916 15 @ 16 c
Figs, black, 1916 5 1/2 @ 6 c
do, 1917 4 1/2 c
do, white, 1917 5 1/2 c
Calimyrna, 1917 9 c

Green Mountain range horses
950 to 1200 lbs. 20@75
Mules:

Great Demand for Dairy Produce.

The California market for butter, cheese, and eggs has been greatly affected by war conditions. In butter this has been especially apparent, prices during 1916 averaging 29.03c. against 26.29c. for 1915, notwithstanding an increase of production of about three million pounds. Most of this increase was absorbed by shipments to England, and the rest by Eastern markets, whose stocks of both fresh and storage butter were depleted by export demands. This accounts for the abnormal movement in the last six months, which is entirely a war condition and cannot be permanent. There has been some slight movement to the Orient, but those markets are now supplied from Australia; coastwise shipments are an item of some importance.

Prominent creamery men believe California butter is now permanently on an export basis, owing to the slight improvement in quality and increase in quantity produced, with conditions favoring further increase. California butter has been well received in London, and some Eastern cities; but there is still room for improvement. The normal Eastern movement is from January 1 to April 1; Eastern and Northern storage stocks are exhausted, and there are not over 300,000 lbs. held locally, against 750,000 lbs. normally.

The problem now is to get all California butter to such a quality basis that it will be fresh and good when three weeks old; if this is done, dealers count on about three months of active Eastern shipment every year.

Local arrivals of cheese were over fifteen million pounds, an increase of over 25 per cent from 1915, prices being almost constantly higher; while for the last three months or more there has been a fairly steady demand for Eastern shipment, with some foreign orders, reversing the usual direction of movement. The immediate causes are the same as in the case of butter; and with increased production and improving quality, for which many are now working, some believe exports will hereafter preponderate over imports.

No Eastern Eggs Coming to the Coast.

Outside demand for eggs evidently prevented a bad slump in prices. Local consumption was apparently below 1915, the arrivals in San Francisco being lighter most of the year; the average price for the year showed less than 1c. advance for 1916. Notwithstanding light receipts, well-informed dealers say production was actually larger than ever before; the curtailment being in Eastern eggs. Owing partly to heavy foreign demand and domestic prosperity, Eastern prices last spring reached extreme levels, and it was the first season on record when no Eastern eggs were brought here. The California output has taken care of all requirements, and for the last few months there has been a steady Eastern shipping movement from one to two cars a week. Storage operations here last spring were normal, but there is no storage stock left now, and Eastern demand continues strong. The high cost of feed has not yet visibly affected production, though the cold weather of late has curtailed output. Ideas differ as to the outlook; some of the leading dealers believe no more Eastern eggs will be brought to California, and that increased production will survive advance in feed, which is largely temporary. Other believe that, unless egg prices advance materially, production will soon decline.

Receipts (railroads) for week ending Jan. 16, 1917—1079 cases.

Receipts (railroads) for week ending Jan. 16, 1916—1339 cases.

Receipts continue to run lighter than a year ago, and an improved consumptive demand is being had. The very high prices East also drew some shipments to the Atlantic seaboard during the week, which had a bullish influence. The market advanced 1c up to Monday on extras and fresh ranch, case count, while selected pullets sold up 2c. San Francisco sold up 3c up to Monday and Chicago advanced 8c on first for the same time and New York 2c. This sensational jump in prices was not without its influence upon the market here. Tuesday on call there was fair trading and higher prices prevailed. Extras advanced 1c and fresh ranch case count sold up 1 1/2 c.

We quote fresh ranch case count 42 c
Extras 41 1/2 c
Pullets 38 c
Candled 2c and selected 3c over quotations.

Dressed 3.75@4.85

HAY.

The market the past week was quiet. More coming in and as the trade had been pretty well stocked up the week before, buyers were inclined to hold back and go slow; but while there was less life to trade prices showed no quotable change, though hardly so firm as last week. Receipts, 158 cars.

We quote f. o. b. Los Angeles:
Barley hay, ton \$18.00@20.00
Oat hay, ton 19.00@21.00
Alfalfa, northern, ton 16.00@17.00
Alfalfa, local, ton 18.00@20.00
Straw, ton 9.00@10.00

BEANS.

There were more moving the past week than for some little time. Receipts were fair and the trade was inclined to take hold again. Shippers and local dealers both buying. Whites were higher, both small and Lady Washingtons.

We quote from growers:
Limas 8.75@8.00
Large white 10.00@10.50
Small white 10.00@10.50
Pinks 7.25@7.50
Blackeyes 5.25@5.75
Tepary 5.75@6.25

HONEY.

The market is still quiet. Not much moving the past week, and what demand had was for small lots to piece out stocks with.

We quote from growers:
Water white, pound 7 1/2 c
White sage, lb. 7 1/2 c
Light amber sage, lb. 7 c
Light amber alfalfa, lb. 6 1/2 c
Fancy white comb, lb. 10 c
Light amber comb 9 c
Beeswax 22 c

Special Citrus Report

Los Angeles, January 16, 1917.

Shipments of citrus fruit from Southern California from November 1 to Jan. 14, 3,749 cars of oranges and 930 cars of lemons. Same time last year, 1,907 cars of oranges and 1,121 cars of lemons.

Shipments from Central California from November 1 to January 12, 3,773 cars oranges and 123 cars lemons. Same time last year 4,097 cars oranges and 97 cars lemons. There was little change in the markets East the past week. The receipts were not heavy

New Dried Peach Contract.

The California Fruit Canners' Association and the Griffin & Skelley Company, which last year had the marketing contract for the California Peach Growers' Association, have been merged, together with the J. K. Armsby Company, in the California Packing Corporation, which now ranks as one of the largest marketing organizations in the country. The peach contract has been placed with the new corporation, which will give the growers' association a great advantage in the distribution of the goods, as well as in the operating end, the Armsby plants, as well as those of the other companies, now being available.

and the market took what arrived at about unchanged prices. Lemons were in fair demand and steady to a little higher at times. Receipts were light, which helped the market.

Locally the market is much the same as a week ago. Local packers bought fairly of the larger sizes higher colored oranges, for which they were offering 1c per pound in the grove picked. Pale colored and small sizes were neglected and they were being bid for at lower prices. Grapefruit was in very good demand at 1@2c per pound in the grove picked. Lemons were very dull. Only the best were being bid for at 1@1½c per pound in the grove picked. Free offerings of cull oranges and lemons interfering much with

the regular market. Only desirable fruit showing any life.

AUCTION SALES.

New York, Jan. 15.—Twenty-three cars navel and three cars lemons sold. Oranges higher on good colored stock, weak and lower on pale stock. Lemons lower. Sales California navel averaged \$1.60@2.80. Lemons averaged \$2.55@2.90.

Boston, Jan. 15.—Sixteen cars sold. Market unchanged on oranges, higher on lemons. California navel averaged \$1.25@3.05.

Philadelphia, Jan. 15.—Six cars sold. Market unchanged on oranges, higher on lemons. California navel averaged \$1.45@2.35. Lemons averaged \$2.40.

Special Livestock Market Report.

Los Angeles, Jan. 16, 1917.

CATTLE: A firm market and fair demand was had the past week. The high markets East making feeders, who are supplied with plenty of feed inclined to hold, and good killing cattle are coming in less freely. Yet there were enough needy feeders in the country with cattle ready to come, to give a fair supply of very good steers and some fat cows. California and Arizona continue to furnish us most of the supply.

Quotations f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs. \$8.25@8.50
Stockers and feeders 5.50@6.00
Prime cows and helpers 6.50@6.75
Good cows and helpers 6.25@6.50

HOGS: There is no change to note in this market from a week ago. A fair supply of very good hogs were had during the week and in sympathy with high markets East, prices were held steady and firm. Still the demand was limited as packers were taking only such hogs as needed for the fresh meat trade, few caring to buy hogs for curing purposes and compete with the big packers of the Central West who have well-matured corn hogs to kill whose meat cures much better than hogs fattened on other feed. California gave us most of the supply for the week, but few Idaho hogs coming in.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300
lbs. 9.25@9.50
Mixed, 200@250 9.25@9.50
Light, 175 @ 200 9.25@9.50

Rough docked 20 pounds, piggy sows 40 pounds and stags 80 pounds.

SHEEP: The high prices are causing killers to slaughter less freely now that the weather is colder and there is a better call for what coming in. Utah and Arizona furnished most of the supply and what coming to market were in good condition. Yearlings and lambs made up most of the supply. Heavy sheep continue scarce and especially firm.

Per head f. o. b. Los Angeles:
Prime wethers \$7.00@7.25
Prime ewes 6.50@6.75
Yearlings 6.50@7.00
Lambs 6.50@7.00

CALVES: A steady market and fair demand was had the past week. Receipts rather light. What came in selling without trouble at \$8.50@9.50.

San Francisco, Cal., Jan. 17, 1917.

[Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F. Hog prices subject to seller standing one-half of all hogs condemned by government inspectors.]

BEEF supplies continue to be a source of worry to packers. Supplies are about cleaned up and buyers are even scouring the country for dairy steers. The market on dressed beef has been forced up to 12 cents, carcass weights, but with present prices of live cattle, killers feel they should secure a better price. Everything but No. 2 steers are marked up.

Steers, No. 1 8 @ 8½c
No. 2 7½ @ 7¾c
Cows and Helpers 6¾ @ 7¼c
No. 2 6¼ @ 6¾c
Bulls and Stags 5½ @ 6c
Calves, light 9 @ 9½c
Medium 8½ @ 9c
Heavy 7 @ 8c

SHEEP and Lamb market is still improving. It has developed that a corner in lambs has been put over by one local concern with the result that others are sustaining losses on this line. Another firm is said to have about all of the sheep bought so there are really two corners on the market. This makes a nice situation for the grower with stock to sell.

Prime Wethers 8½ @ 9½c
Ewes 7½ @ 8c
Lambs 11 @ 12c

HOGS: Receipts are still falling off but offerings are of a better quality than they have been. No Idaho hogs are being purchased here but report has it that they are not so good as in previous seasons. Prices are again marked up on heavy weights.

[Rough, docked 20 pounds, piggy sows, 40 pounds, stags 80 pounds.]
100 to 150 lbs. 8½c
150 to 300 lbs. 9¼ @ 10c
300 to 375 lbs. 9¼ @ 9½c

WOOL remains as last reported. All buyers are in the field but we are unable to change our quotations because of lack of trade. It is thought that the coming week will see more activity. A 20 per cent slump in London market is reported. England is allowing wool to come to U. S. from Australia and other colonial possessions. Red Bluff, year's 25@27c
Mountain, fall 16@20c

Potato Supplies Short.

The firmness of potatoes is due to an exceptional demand from points as far east as Chicago, and from the Southwest, which are absorbing all the Oregon and California stock they can get. Until very recently the car shortage and cold weather prevented these Eastern shipments on a very large scale, especially from Oregon, and the result was an easy market here; but with more cars the stock is rapidly moving off. Dealers say fall prices East made new records, owing to the short crop. The question now is, How much did the prices curtail consumption? Unless the consuming demand was materially reduced from its usual volume, supplies everywhere will be short before the new crop appears; and the present market is reflecting the anticipated shortage.

Publisher's Department.

The third edition of our California Vegetable book has been exhausted. Prof. Wickson is at work revising its contents, and we hope to have the fourth edition ready for the trade by September, 1917.

Read our market reports. We are devoting a good deal of time and space to give detailed authentic reports of the greatest value to producers. Look up the particular lines you are interested in each week. It will pay you.

Many nurserymen report that special fruit tree stock has been all sold. As we have stated several times of late, it will pay intending planters to buy early, before the variety wanted has been all taken.

FOUR NEW BOOKS.

The Orange Judd Co., of 315 Fourth Avenue, New York, has recently issued four books of agricultural interest:

"Judging Farm Animals" by C. S. Plumb, Professor of Animal Industry, Ohio State University, is a well illustrated book of 600 pages. The author has divided the volume into five parts covering Farm and Function, The Horse, Judging Cattle, Judging Sheep, Judging Swine. The author makes it easy for the reader to follow the discussions through and get the real value from them. Price \$2.25, net.

"Poultry Breeding and Management," by James Dryden, Professor of Poultry Husbandry, Oregon Agricultural College. This book contains 416 pages, well illustrated. The author's long experience in poultry experimental work is used freely in every chapter of the book, making it of practical value to the poultry producer. Price \$1.60, net.

"Modern Fruit Marketing," by B. S. Brown, Professor of Horticulture, University of Maine, is another valuable book of 300 pages, price \$1.25, net. The author discusses fruit harvesting operations, preparing fruit for market, packages, packing, storage, transportation, selling organizations, etc.

"Semi-Centennial History of the Patrons of Husbandry," by Thomas Clark Atkeson, a book of 370 pages, will interest members of the Grange. Price, net, \$1.50.

Beans Make New Records.

The 1916 bean crop is now practically all out of growers' hands, except for some of the limas and the small whites which were damaged and move slowly. Prices on practically all varieties have reached unheard-of levels, and scant provision has been made for market requirements between now and the new crop. The entire California crop is estimated by well-informed dealers at about 3,600,000 sacks, of which less than 1,500,000 sacks are now left in the State. The crop, though below that of 1915, was far ahead of all former years, but the demand has surpassed all records, both in the East and in export markets. The Michigan crop of whites was very light, and the damage to the local small whites tended to strengthen the market.

When the new crop came in, the market was bare and prices already unusually high, which encouraged many to sell at once; a few had made contracts at rather modest prices before the crop matured. Most growers, however, seem to have taken their time about selling, and received at least a share of the advance which has taken place since harvest time. While the extreme prices in some lines are evidently curtailing the demand, many inquiries are now being received; and in view of the scarcity some further advances are not unlikely. Whether the demand will continue next year is very uncertain; but under war conditions it would seem fairly probable that next year's crop will be favorably received, and the market entirely bare by fall.

Quite a large tonnage of Oriental beans is now arriving, but is mainly for export to other countries; most of the Japanese crop having been sold in advance for Europe. Perhaps 20 per cent of the imports will remain in the United States, and there will be practically no competition with California varieties.

TRADE MARK REG.

A Complete Line of Automobiles All New Values

From your point of view this announcement is most important.

For herein we set forth the achievement toward which this company has aimed for the last eight years.

This achievement in a word is the completion of our gigantic organization to a point where we could make and market a complete line of automobiles under one head.

One executive organization,
—one factory management,
—one purchasing unit,
—one sales expense,
—one group of dealers,
plan, produce and sell the entire line.

Buying power is concentrated. Costs are distributed over all these cars. The savings are tremendous.

As a result we are producing cars of exceptional quality—and marketing them at unusually low prices.

Every car is built to a rigid standard of performance, comfort and appearance.

The new Light Four at \$665 is a striking example.

It has good style—built low with harmonious and full sweeping body lines. It is a beautiful car in every sense of the word.

The motor is powerful, quiet and of sturdy construction. The turning radius is short. The car has a quick acceleration and is built to tour safely and comfortably from the Atlantic to the Pacific.

And with all these good qualities *it rides beautifully*. The soft cushions, the long resilient cantilever rear springs, the large tires (31x4) and the proper balance in construction absorb all types of jolts—the choppy cobblestone, the cuppy macadam and the heavy ruts and thank-you-ma'ams of American highways.

Yet this is but one of the new Willys-Overland values.

Never before have the economies of vast production been available for buyers of every class of car.

And the Overland Policy of greater production, higher quality, lower price is exemplified in every model and type.

Using Vines' Reserve Food for Grapes.

[Written for Pacific Rural Press]

THE greatest draft on a grapevine's energy should be in elaborating sugary meat for the berries. To secure this condition of most economical and biggest production, requires attention to all phases of grape culture. But aside from setting a good crop, the principal cultural features are irrigation, cultivation and proper pruning to prevent dissipation of the energy into useless wood to be pruned off again. Vigorous grapevines store an abundance of starchy food in their arms, trunks, and roots, to be used in starting early spring growth. If they are allowed to waste this "reserve" in riotous early growth, or to use it later in spring or early summer when the leaves and roots should be supplying all substance necessary for growth of vine and grape, there will be none left at sugaring time. If this reserve be husbanded properly, the vine will use it at maturity of the grapes, making them solid, sweeter, and heavier, giving a bigger crop and of best quality.

Cultivation.—Cut off surface root feeders by plowing deeply in the centers; and less deeply close to the vines, at or immediately before blossoming. Let the ground lie awhile to dry out if wet, and to prevent riotous growth. Watch the ground and cultivate at the proper time to conserve enough moisture so the vines won't suffer until the first available irrigation after the berries are well set and mostly the size of shot or larger. F. H. Booth of Fresno county did it as follows, last season, with great satisfaction. He plowed in April and cultivated crosswise soon afterward, because his ground is not wet, being an ashy loam several feet deep. Then after the first irrigation, he cultivated with spring tooth, trying to get over the whole place every ten days. A weed cutter worked fine under the vines, and left a good mulch.

Irrigation.—The first irrigation came too soon, and resulted in some shot-berries. It was applied before blooming, because water was not to be available again for a month. Now he says he would rather have none at all, but conserve moisture by cultivation, till the next run. Water was just run over the ground lightly as possible, straight down the rows. At the second run of water about June 1, everything was saturated to the hardpan by starting a 4½-foot head of water onto the highest points and making high-leveed checks on contours. Water was held in them on one

side all one day, for the high places needed the most thorough soaking. Lower checks were not flooded so much on account of seepage to them. This irrigation took three days of 12 hours each. The third irrigation came shortly after July 4 with the same head and by the same system, but taking only 1½ days on the 12 acres. Later, certain spots showed need of more water, by browning leaves which would not have hung much longer, and a fourth irrigation was given to care for these as well as to sustain vines with very heavy crops which were to be held later than natural. No waterberries appeared in the crop, which when seen in mid-September, included a lot of good second crop bunches of big berries, solid and of fine color. Where vines were weak and grapes shriveled, they had "come back" after this irrigation.

Without adequate cultivation and irrigation, the vines would have called out their reserve food early in the summer, to support themselves, their roots, and crops. Having exhausted their reserves, it would have been proportionately harder for them to start well again when renewed attention was given; and impossible to finish heavy sugary crops or strong wood, if the neglect continued.

CHAIN-PRUNING MUSCATS.

A few acres of Muscat vines now belonging to A. T. Hawley of San Diego county made rank wood growth, but wouldn't bear on account of coulure. That was some 20 or 30 years ago when they belonged to

Geo. Hawley. Their neighbor, Mr. Asher, suggested chain-pruning. They did it, and the vines have borne ever since. The Hawleys frequently pick 60 pounds per vine when ordinary vines yield a tray.

The vines had been set 12 feet apart on strong silty-granite-clay soil 29 feet deep in El Cajon valley. Instead of cutting all of the spurs short as usual, one of the strongest was left in each of two directions five or six feet long. These were pegged into line along the ground and left to grow. Not enough pegs were used, for now these canes bend and twist along the row like snakes. If they had been held straighter in line, the cultivation would have been easier all these years.

Spurs were left around the crown as usual; and the following winter, the shoots from the long canes were cut for spurs. They have been

WINTER'S BACK BROKEN.

IF OUR memory has any standing in weather prophecy, we should say that we have passed the crest of the winter way of 1916-17. We count it usual to reach the lowest temperatures within a month beginning on Christmas day; and though the thermometer has been groveling most unusually this year, elevation should now displace depression. There has been some loss to succulent things by an extreme of 18 to 20 degrees above zero, which has been reached at several valley points, and there has been much scurrying for fuel because the car-famine has delayed shipments. Diligent use of orchard-heating devices has, however, largely reduced injury, when value of exposed products justified this investment, and the chill of personal exposure to such low limits for a brief time will soon be forgotten. Now we want it warmer and wetter. Southern California has the advantage over the rest of the State this year in getting these twin joys, while the central and northern valleys were still cold and dry. Now it is to be expected that the rest of the State will get the warmth which goes with wetness, or vice versa, as you like it. We notice that some weather sharps have objected to our criticism of the Oregon weather prophet, who claimed last fall that this winter would be warm and dry. Our proposition to him was true when made, and is true still: that when it is warm in winter in California it is wet, and when it is cold in California it is dry. Therefore, if he was sure it would be warm we would take the chances in its being wet. Now, as it worked out, it has been dry and therefore cold—that is dry when it has been cold. We are ready still for his prophecy of warm weather to redeem itself and to bring more rain. The dry year part of the Oregon prophecy has already gone wrong, for at most points in California the rainfall is near the normal and at some points beyond it. If the season goes along as it has during its first half, there will be water enough and no cause to worry.

BACK-YARD VISIONS.

IT ALWAYS seems a thankless task to embroil the pangs of a joyful, self-deluding liar, and yet one must not always avoid it, because such falsification may, by constant exercise, mislead others—either by implication or direct approach. On the face of it, it might seem that a man could be allowed to see visions and dream dreams in his own back yard without interference, and so indeed he might, if his indulgence were not trumpeted in the public ear for the very wide propagation of error. It is to such an imputation that the current exhortation to vacant-lot and back-yard food production in our thinly-built towns are rendering themselves liable. We have recently been reading some of them, and though many are reasonable and their results attainable with wise and adequate effort, others are calculated to make Aladdin rub the plating off his wonderful lamp in emulation. This will do for a sample:

"A minister in a small community, who had a back-yard 38 by 60 feet in size, sold produce from this area to the value of more than \$325 while still pursuing his regular vocation."

We do not say this is not a fact, though we are quite at a loss to know how it could be done, and no information is given on that point. But, granting that this preacher's garden-report was just as true as his sermons, what are the results of repeating such a tale? One result will be disappointment to all who undertake back-yard gardening, which is a very pleasant recreation, if one has interest and liking for it, and a reasonably profitable one also. The income reported is probably at least six times as much as one could reasonably expect—even if he worked hard and intelligently and credit up all his produce at prices which he would have had to pay at retail for it. But the false ideas propagated by such a story are much wider-reaching than that. They affect a thousand who never try food-growing to one who does try, and is disappointed by not realizing such reward. From these false ideas come the impressions that farmers are overpaid for their work in food production; that the consumers are being robbed by the farmers; that it is easy to get hundreds of dollars from acre-fractions of land and all such falsehood and nonsense about farming, which our popular journals are setting forth in a sensational way. Such publications push into farming many who lack knowledge and other qualifications for it; they inflate land prices, raise taxes and wages, and make it continually harder for the farmer to get any reasonable profit from his business. Back-yard visions are really the worst enemy of fair-priced food production.

FRONT-YARD REFLECTIONS.

OF COURSE we believe in the joy and profit of back-yard vegetable growing, if it is not foisted on the public with such an outburst of consecrated imagination as is manifested in the ministerial proclamation noted in the preceding paragraph. The cottager's garden has such a place in poetry that we cannot doubt its title to figure also in domestic economics—which is becoming quite a poetic affair. Still, seriously, we do believe in city dooryard gardening, and we really enjoy the sight of one neighbor's front yard, which is run from year to year with an alternation of celery and cabbages forward to his front line on the street, vastly more than another neighbor's outfit which has colossal ash piles in the rear and a tangle of neglected and pest-ridden shrubs in front—a condition which he explains by the high cost of water and of Oriental labor. To us, a well-kept cabbage is handsomer than a forsaken chrysanthemum. It should be remembered that any kind of gardening is scant of beauty and nutritiveness unless one has a heart full of desire and an arm full of physical energy. This is the reason why we count most exhortations to door-yard food production vain, and also why we look upon exaggerated reports of profit therein as likely to lead only to disappointment and desperation. You cannot make a good gardener by economic exhortation any more than you can make a saint by statute. In both cases there must be emotion welling up under the top button of the waistcoat, and, in the case of the home gardener for crisp vegetables, there must also be a yearning under the lower buttons thereof. Unless you get this combination, joyful exhortations unlock no door-yard food-production problems.

A HINT AT GOAT-GARDENING.

IN VIEW of this requirement, which is often difficult to meet, we are wondering whether the exhortation to goat the dooryard is not, after all, more rational than the one to garden it. It is surely more unique. It was announced by the publicity expert of the University of California last week that "most families can use the product of a quarter of a cow"; and when you ask, "which quarter," you get the whole argument. It is like this:

"That a back yard and a front yard of an ordinary city lot will sustain that quarter of a cow in the guise of a goat and that milk bills

may thus be rendered negligible and assist to the extent of \$50 or \$60 a year in reducing the cost of living, is the opinion of Professor G. H. True, of the University Farm School at Davis. He says the grass from a front lawn, together with the refuse of a vegetable garden, will keep the goat well, while it would not be sufficient by 75 per cent to keep a cow."

The suggestion is surely a good one and it has no exaggeration, which is one reason why we like it. A goat will not only eat the refuse of the garden, but, if you get the right kind of a goat, it will eat the garden itself, including the morning paper, the contents of the clothes' line, the door mats, the kid's base-ball mit, and the paint from the backsteps. In other words, it will ensure absolute cleanliness of the whole place, which is a fundamental of good gardening.

CHOICE OF GARDEN GOATS.

BUT we presume that Prof. True does not refer to the circus-poster breed of goats which you see making sleeping porches of cabin-roofs in the outskirts of our towns, as your train speeds through. These goats are certainly a beneficence in their station and bring many comforts to their owners, but they are anathema in the exclusive residence districts. Offspring of imported Swiss and other foreign goats should be sought by those desiring this kind of garden ornament and service. They have less plebeian tastes and recreations, and devote themselves more diligently to milk production. Californians have imported and multiplied these goats, but their desirability in suburban home economics is not adequately appreciated. If our suburban garden makers would spend less money on a cast-iron meagerie and build pedestals on which pure-bred Toggenburgs or Saanens could disport themselves at milking times, with a fine back-ground tracery of shrubs and vines, each rising and setting sun would fill our souls with truer art and our bodies with purer pabulum.

WORK AND WAGES.

BUT let no one think that he can get any of these things without work. One fault of exhortations to home gardening is in omission of the secret of success, which is work. Home garden products are the translation of work into their form and substance. They are a distinct addition to your role of toil—whatever that may be. It may be a change of work, which some psychologists call recreation, but it is work nevertheless, and its reward is wages. If these delight you, you are fortunate and your success will be both an inspiration and a satisfaction. If these distress you, even success may leave you weary for the requirements of your vocation. They may reduce your efficiency in working hours and render your slumber less restful through the trampling of Alpine goats upon your exalted abdomen. Our observation is that the chief exhorters to the transformation of a home outfit into an earning-machine do not practice what they preach. They are prolific of prescriptions which they never have filled for themselves. On the other hand, the men who have the best home-grown vegetables have least to say about them except as a help and joy to those for whom they live to provide; and this is the reward that gives them joy. Unless you can awaken this in the life of a man, his adoption of exhortations to homestead production may lessen his force in his proper work, or, what may be worse, so unbalance his contentment as to turn his home place into a bear garden.

CALLING FOR MORE COLLEGE WORK.

THE most significant demonstration of the practical value of the work in research and instruction now being pursued by our College of Agriculture at Berkeley, is the wide popular call for more of it. It is this, in large part, which made the institution during the earlier years. It is the same attitude, now manifested more widely and clearly, which is underlying its present development. It has now a collective undertaking which requires fuller resources. It always has had

this and it will always have it. On its own part it naturally calls for the means to successfully carry on the undertakings now in hand. Such requirements are large in the aggregate, and it does not participate in the agitation for new undertakings and establishments, but its attitude is, as we understand it, one of obedience—the college will endeavor to carry out all work which is adequately provided for, if such work is reasonable and feasible and germane to its main aims and purposes. It strikes this writer, wholly apart from any connection he may have or have had with the institution, that the line of deciduous fruit research which the Santa Clara Valley is asking the Legislature to provide for is reasonable, and in fact necessary to the promotion of this line of the State's industry. If it is to prevail, however, it must be by the force of the industry, and in answer to its call. Therefore, it is a matter which deciduous fruit-growers in all parts of the State should interest themselves in and declare their desires upon.

The same thing is true of a smaller but still very urgent need of the fruit industries, as declared for by the Napa fruit-growers' convention, viz.: "To provide for experiment and research in the drying, canning and preservation of fruits and the handling, preparation, and manufacture of fruit products and by-products." A law proposed toward this end says that the Director of the Agricultural Experiment Station shall obtain and establish such assistants, equipment, appliances, apparatus, and other incidentals as may be necessary to the successful prosecution of the work within the appropriation specified of \$5,000 per year. Considering the number and variety of the problems in fruit-curing which need to be solved by exact experimentation, the money to be available seems very small, but it may do for a beginning. That, however, is what the fruit-growers' committee asks for, and it should certainly be provided, if the Director of the Experiment Station accepts the charge laid upon him.

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Hens and Prunes or Almonds.

To the Editor: On about three acres of my alfalfa the yield is unsatisfactory, due to the slope being too steep to get proper percolation of the irrigating water. I propose to use it for chicken runs. I need shade and am thinking of planting prunes, cultivating a narrow strip on each side of the tree rows and leaving the balance in alfalfa for the chickens. My soil is "Orland fine sandy loam," but it does not take water as readily as that description would imply, and being graded on the strip-check-system I have to irrigate once a week during the hot months. Would such frequent light irrigations be harmful to prunes? As the strip-checks are thirty feet wide it would be too wasteful of space to plant trees only on the levees and irrigate the trees separately by furrows when needed.

Is the equipment necessary to the drying and marketing of prunes too expensive to permit of such a small planting as I am proposing being profitable?

An alternative is to plant almonds, for which the thirty-foot spacing would do nicely and for which, in view of the very slow water percolation referred to, the perfect surface drainage of the levees would be desirable. My preference for the prunes is due to their reaching maturity quicker.

With plenty of alfalfa available will chickens consider themselves under moral obligation to strip the young trees, either almond or prune, of all buds and leaves?—Beginner, Orland.

Thirty feet apart is not a bad distance for prune trees when you use the middles as proposed. If you really wish to get in more trees, plant them 20 or 24 feet apart on the levees—leaving them 30 feet one way. If you wish to let the water down more slowly to get more penetration, put in a few low cross-levees inside the strip, so that they can fill up and spill over from one into the other, etc. If you are careful in use of water the trees will not get too much and ought to do well.

The outfit for curing prunes is not more costly than for other dried fruits. You should have a good machine dipper, but you can get a small size and to offset the cost of that you need no sulphuring outfit. All you will need is trays and a grading screen and common sense enough to make a good product. If you use plenty of that, a small product will be profitable.

Why do you think prunes will come in sooner? We should count prunes a year or two slower than almonds—growing conditions being equally good for both.

With plenty of other green stuff the fowls will not bite the tree foliage enough to hurt. Barring a certain amount of cussedness, a hen likes to have her grub below her nose, as well as a man does. Of course you must not graze too many fowls on the area: that will kill out everything—including the hens.

Slander on California Nursery Stock.

To the Editor: We are always buying new fruit trees for resetting, owing to sour sap on trees budded to peach, apricot, myrobalan, bitter almond root. We see no difference, as to which is best. The trees are always got from the near-

est nurseries to us, which I judge is the best plan, but one of our local agents for some outside nursery has been telling people that all trees grown on home-grown seed are not good, that they are infected with black-knot and other injurious pests, or diseases to which the foreign-grown seedlings are not subject. Some of the people believe so, and others cannot see where the home-grown stocks are inferior or subject to these things. Please tell us whether there is any such difference as claimed and which is best.—V. M., Santa Clara county.

The statement favoring foreign seedlings is false. They are just as subject to diseases as locally-grown seedlings are and will do no better under the rather hard conditions which you must have, if all the fruits you mention are sour-sapped. Besides there are probably no foreign seedlings of apricot, peach and almond in any American nursery. Formerly many myrobalan seedlings were imported, but we doubt if many are now brought in from France. If there are, they have no immunity from disease and they were never introduced with any such idea. The French used to grow them and grade them more cheaply than we, could in this country. Good California nursery stock is better than imported. Eastern nurserymen buy much of their fruit seeds or pits in this State. Your "local agent" belongs in the Ananias club.

Too Much Water and Alkali.

To the Editor: I have land that has very much sub-irrigation and a streak of it is mixed with alkali. I have tried to plant Thompson Seedless, but they died out in July on that streak, for the ground was very wet then—seepage from the ditches, I suppose. How would almonds do on this place, or plums? Is there a way of draining this particular place from subirrigation? I have a ditch that is three feet lower than the level of this land.—J. K., Dinuba.

There is no chance for almonds if grapes cannot stand it. Plums on myrobalan might have a chance—if the alkali is not too strong. Pears would be most likely to hold on, but alkali pears are not first-class. However, it is all guesswork until it can be determined whether the alkali or the water is the worse mischief-maker. More things will stand water than alkali. Are you sure your ditch is working and really drawing the water down to three feet? If the alkali is not too strong such a piece of land is likely to yield more value in beets for stock than in fruit.

Plant-Lice on Hawthorns.

To the Editor: Please advise me the proper treatment of two Hawthorn trees that I have had trouble with. I have sprayed them with nicotine and soap solution without any perceptible benefit. At this season of the year the trees are bare of leaves and show a black coating: that no doubt constitutes the cause of the trouble. What can be done?—P. R. S., Oakland.

The black stuff which you find is not the cause of the trouble—it is a by-product of it. It is a black fungus grown last summer and fall upon the honey-dew exuded by plant lice, which are the

cause of the trouble. You may also see in it shining black bodies, if you examine it with a magnifying glass. These are the eggs of the plant lice from which lice will hatch next spring to attack the new leaves. As these eggs have such resistant shells that it is impracticable to destroy them with a spray which will not also injure the bark, you will have to wait until they are hatching out. Then attack them with the tobacco spray and repeat it in about two weeks to catch later hatchings. Much depends upon spraying early after growth starts and spraying as often as necessary.

Cutworms and Katyids.

To the Editor: What can I do to my peach orchard to keep the cutworms from getting my fruit this year? What is on this twig which I have found on my trees? Is it harmful?—J. H. P., Kingsburg.

If it is really the climbing cutworm which is getting your peaches, the treatment is the bran-arsenic death for them. Take bran 10 lbs., white arsenic $\frac{1}{2}$ lb., molasses $\frac{1}{2}$ gallon, water 2 gallons. Mix arsenic and bran dry. Stir molasses and water together and then mix into bran, making a moist paste. For cutworms and grasshoppers, distribute a handful at base of each vine or tree, or it may be broadcasted. Insects will only eat it when moist. When distributed by handfuls it may be gathered up and moistened again. We wish cut-wormy readers would paste this in their hats and save us from printing it a dozen times a year. Of course you have to tie up the fowls and pet stock while you are putting it out.

The twig has the eggs of a katydid—seed-like bodies in two regular rows. They are negligible.

Split Pits and Smut Balls.

To the Editor: What causes smut in peaches? I have about an acre of my Muirs in a sandy swale and last year half of the fruits were split and had a smut ball in the split and some that were solid had smut. What will control it?—J. R. C., Fowler.

Last year was evidently a bad one for peach splitting. As recently stated in this column, the cause of splitting of the pit and fruit is not known, but it seems to be due to causes which produce abnormal growth, and some varieties are more susceptible to these causes than others. No treatment has yet been demonstrated to be effective. The smut growth is a fungus growing on the juices set free by splitting, and the way to escape that is to prevent the splitting—which no one now knows how to do. Smut in a peach which apparently has a solid exterior is due to entrance of germs through an opening of the stem attachment—which may be too small for anything but a fungus germ to see.

In a Half-stand of Alfalfa.

To the Editor: What can I sow in a half-stand of alfalfa? Will vetches or peas do? I do not like barley.—R. P., Modesto.

It is too late to get vetches or peas enough to pay the cost. They ought to have been started last fall. Besides, it is not easy to get much from these large seeds by simply scratching-in. They require good preparation of the land. Why do you wish to keep your half-stand of alfalfa? Why not go at it now and get the land ready for re-sowing next month, perhaps, in your section? If there is real reason to hold on to a half-stand we would get what more we could by sowing bur clover. It ought to have been done earlier, but we know nothing which would be more likely to catch-in now.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco, for the week ending at 5 p. m., January 23, 1917.

Some Experiences in Walnut Budding.

[Written for Pacific Rural Press by I. G. Grundel, Oakdale, Cal.]

[George Grundel, manager of the John Swett & Son's Nursery at Oakdale, has for the last six years been investigating the possibilities of budding walnut trees—both nursery trees and large trees. He has tried out buds of all shapes, sizes, and ripeness, and has worked out successful methods which give uniformly good results. In the article following he sets forth the right way and the right time to do this work.—Eds.]

Having experimented for years in walnut budding, and having budded every two weeks during the season, I have at last hit upon the right way and the right time of doing the work. A statement of my experiences may interest the readers of the Rural Press:

Spring Budding.—Cut budding wood, either two or one year old—the latter must be round wood only—during January. Keep in cold place until the latter part of March, then pack in moist sawdust and keep in a warm place. The early varieties will start sooner than the later kinds, and should be kept cool for a longer time. In this way, by shifting back and forth, you can regulate the temperature so that the bark will slip by the last week in April. Budding can then be done as long as the buds hold out. It matters not if the buds are swelling, as the secondary bud will grow. You may be able to get only a few buds at the time off one strip; return the rest to the sawdust for a week for future use. Take budding wood in the left hand, and with knife make a cross cut one-half inch above and one-half inch below the bud, and then a cut lengthwise from one-fourth to three-eighths of an inch on each side. Carefully peel bud with the blunt part of knife so as not to injure the cambium layer. Hold the bud over the spot without moving and cut across, above and below the bud, then remove same and cut through lengthwise, peel back and slip in the bud. Peel off the loose bark except enough to cover cut, and if the bark is too thick, as in two-year-old wood, level down so the string presses on all portions of the bud. Use two strands of cotton twine and wrap both ways as tight as you can. Insert bud on north or west side. After 15 days cut the string and part of top; after one week, if bud has taken, cut off entire top, leaving 4 to 12 inches to be cut later when bud is growing. This budding can be done in from one- to three-year-old wood 1½ inches thick, or less.

Following is the way I have budded old trees: First, I top the tree, leaving the best suckers to grow, and budding them in August. I have budded a hybrid, 10-year-old black walnut, and lost only one in 20 buds.

Budding in July and August.—July buds will make a growth from one to four feet, but August is the best month if you don't desire a growth that season. Prepare the buds on the tree that you want to use for furnishing buds, by cutting leaves; leaving part of leaf stem, which will drop off in a few weeks, which then can be used as bud, after the scar at the base of the leaf stem has healed. Then proceed as in spring budding.

Questions will be cheerfully answered.

California Peach Growers' Association.

[Written for Pacific Rural Press.]

Out of the 28,000-ton California dried-peach crop for 1916, only 9,000 tons were remaining on the Coast Jan 12, according to Sales Manager A. J. Sturtevant, Jr., of the Cal. Peach Growers Inc. Never within recent times have so few remained at this season. Practically all of these are in warehouses controlled by this Association. Since the holidays are past, business is picking up. The trade has shown appreciation of the Association grades, and the growers' loyalty has been "phenomenal." The Association now controls 85 per cent of the total peach acreage and expects to add at least 5 per cent more by efforts to be made this spring.

Payments for the 1916 crop under the contract were \$70 per ton cash on delivery and \$30 per ton in negotiable interest-bearing notes. The bankers have cashed these notes at their face value with no discount, being content with the simple interest, showing remarkable faith in the organization.

Final settlement for the 1916 crop is yet to come, and there will be a substantial payment to growers in addition to the advances mentioned above. There will also be a divi-

dend on the capital invested in stock of the Association.

Increasing Consumption.—No advertising has been carried on as the raisin and citrus growers have; but next season it is proposed to spend as much per ton for advertising as the Raisin Co. spends for its crop. This is to increase consumption.

Recipe leaflets were hurriedly put out in the rush of last season and have been very effective. A recent letter from a retailer in New York State said he had found two recipe books in a package but couldn't keep them, and wanted more to distribute among his customers. The Association is now preparing a more elaborate one.

Heretofore dried peaches have been sold in bulk, not always presenting clean, attractive appearance. Many are now being put out in family-sized cartons.

Peeled Dried Peaches.—Glass cans filled with cooked dried peeled peaches are on exhibit in the offices, looking as attractive and considerably more edible than the common canned peaches. The recipe books and cartons are designed to make dried peaches eatable. But to a far greater extent, peeled dried peaches

are hoped to create insistent demand. They are already proving popular, being now sold to the trade at 11 cents per pound for fancy peeled, as against 8½¢ for fancy unpeeled. The small difference in price is due to the Association's cheap mechanical process of peeling and leaving the dried fruit exceedingly attractive. The common dried peaches are put through a solution which softens and swells the skin loose. The skin is then brushed off.

Growers are invited to send in a catchy slogan to go with all of the advertising of the Cal. Peach Growers Inc., Fresno.

WAIT BEFORE PRUNING FROSTED LEMONS.

[Written for Pacific Rural Press.]

Severely frosted lemon trees whose tops seem to be dead should not be cut back for at least a few months, according to J. D. Salvester of Poway Valley, San Diego county. Some of his trees seemed killed on various sides or all through the tops by a frost about the holidays. These have been left alone; and are already shooting new sprouts near the top, showing how far it is necessary to cut back. There is no harm by letting such trees wait a while before pruning; for if they are dead, they needn't be replanted before spring anyway, and they may be saved.

GOT RID OF BUD-EATING BIRDS.

To the Editor: To get rid of linnets that eat the apricot and peach buds, take ripe juicy oranges cut crossways and dose with powdered strychnine. Rub it into the juice. Stick the pieces on spurs of the trees with juicy side up where the birds can get at them. Last year I baited two dozen trees and picked up over nine hundred linnets. This year they are not so plentiful, but a flock came, so I baited the trees and in four days picked up 340 linnets. Very few of the harmless birds eat the bait.

SUMMER ORANGE BLOOM.

[Written for Pacific Rural Press.]

Navels from summer bloom are coarse, like the Australian strain, are light colored, usually green around the navel. They are a month or so later than others, and rather dry. They are unsalable under the Fruit Growers' advertised brands. R. Hefty of Pomona has observed that summer bloom is often the result of cultural conditions that might be avoided. This is especially true if the orchard is neglected too long, after which an irrigation may start the bloom.

PERENNIAL RASPBERRY.

To the Editor: Among my rare fruits is an evergreen golden raspberry, the Rubus ellipticus. This bush is four years old, 14 feet high with a spread of 28 feet. Larger canes are over 2 inches in diameter. It fruits at about four years old. The leaves do not drop nor the canes die back as with other raspberries and it is very ornamental. The bush from which mine was propagated has fruited very heavily for several years. It stands about the same degree of frost as the orange.

Watsonville. C. H. Hughes.

Armstrong Nurseries

ESTABLISHED 1889

Grow Large Olives

Plant Ascolano Olive trees and grow large ripe pickling Olives, which ripen early; meet with ready sale and demand fancy prices;—yes, a "premium."

The present supply of fancy ripe pickled Olives is thousands of cases "short" of the actual demand in two of our largest cities: Chicago and New York—and people are just beginning to learn to like and eat ripe Olives.

The Ascolano (Queen Olive) often attains a size equaling a French Prune, to which it is similar in shape. The tree is a strong grower and a good bearer. Fruit ripens in October, thus escaping any probable early freeze.

I have a few thousand trees of this excellent variety, yet to offer this season. Am booking orders now for either immediate or later delivery, and you can not go amiss in placing your order at once, as present prices will no doubt be advanced later on in the planting season.

Write me NOW,—before you lay this Pacific Rural Press aside—stating number of trees wanted, and prices will be quoted you promptly.

Can also supply choice trees of MISSION and MANZANILLO varieties. These are propagated from the best producing strain of full-bearing trees in the country—are straight, clean and thrifty; grown in a loose, sandy loam soil, producing the finest root system obtainable; they will make a quick start and a vigorous growth, and come to bearing early. Prices quoted of any number desired. WRITE FOR SAME.

John S. Armstrong, Prop.

406 EUCLID AVE.,

ONTARIO,

CALIFORNIA

Complete Catalog FREE

PRUNE TREES

A few thousand trees yet to offer. All choice stock. Standard varieties on peach and myrobolan root. Attractive prices quoted on any number or variety desired.

PLUM TREES

All the Best Commercial Varieties.

Duarte, Formosa, Gaviota, Satsuma, Santa Rosa, Wickson, Burbank and others. Every tree a perfect tree. Prices on application.

ALMOND TREES

Your order for Almond trees should be placed soon. The demand will evidently exhaust the available supply, early in the season. As yet, can supply choice trees of all standard varieties. Clean, thrifty, well-rooted stock—at right prices.

WALNUT TREES

Placenta, Neff & Other Varieties. "Sticky," well-rooted trees;—grown in sandy-loam soil,—producing the best trees obtainable. My trees are free of blight. Prices will be quoted promptly on request.

Shade Trees, Ornamentals and Roses

A collection without an equal in California. Every desirable Tree, Shrub, Rose, Vine and Plant, adapted to both Coast and interior climatic conditions. Illustrative and descriptive catalog, FREE on request. Special estimates gladly made on large quantities required for public and private grounds. Write for Catalog and state your requirements.

Grow More Fruit

There is a constantly growing demand for fruit all over the country which almost exceeds the supply. There is money to be made from planting fruit trees, and we are in a position to supply you with the best kinds and qualities.

We have the standard varieties in

- ALMONDS on both Peach and Almond Roots.
- PRUNES and PLUMS on Peach, Almond and Myrobolan Roots.
- PEARS on both French and Japanese Pear Root.
- PEACHES, both Cling and Free-stone varieties.
- NECTARINES, GRAPEVINES, ORANGES, LEMONS, POMELOS, ETC.

You will be interested in the Ornamental Trees and Vines that we carry and we invite your correspondence.

Address Department "B" for free price list and illustrated catalogue.

There is Big Money in APRICOTS

The market can be depended upon to consume the entire output at profitable prices in both green and dried conditions.

The three leading varieties are ROYAL, BLENHEIM and TILTON, and we have them on hand ready for immediate delivery.

THE FRESNO NURSERY CO. INC

FRESNO, CALIF. P.O. BOX 615

Status of the Fig Industry in California.

[From an address by Prof. J. Elliot Condit, University of California, at the Fig Growers' Conference at Fresno last week.]

While only three or four varieties of figs are grown in this State for drying, a very large number of varieties are grown for table use. The many varieties differ in their characteristics according to the varying climatic conditions in different localities. When we consider that there are hundreds of varieties, many of them bearing several crops in a year, the figs of each crop being distinct from the other, and in some cases the color changing when the fig wasp is present, and to all this confusion add the thousands of seedlings which have been widely distributed by the U. S. Dept. of Agr., one can get some idea of the confusion which exists. Prof. Condit of the University of California proposes therefore to make a thorough study of the systematic pomology of fig varieties. At the Plant Introduction Gardens at Chico there is a collection of some 80 varieties, 44 of which are from the Chiswick list. J. Leroy Nickel on his estate at Menlo Park has probably the largest collection of varieties in the State. Many of the most tender are grown under

glass. His list includes all the varieties collected by John Rock and by Felix Gillette; all of the U. S. Dept. of Agr. introductions, all of those of the Royal Horticultural Society of London and lists from several of the large nurseries in France. Prof. Condit has already made accurate pomological descriptions together with careful photographic records of 131 kinds of figs from these collections.

Dried Figs.—There is very little really accurate or genuinely scientific information available. No one knows the precise relation between climate and dried figs. The interrelation between climatic conditions and the life history of the fig wasp is not well understood. The University has therefore undertaken a comprehensive study of the conditions under which dried figs are produced. This includes a study of the effects of low temperatures on the trees or winter killing; the effects of high temperatures on the fruit or sunburn; the effects of soil moisture and atmospheric humidity on the fruit or souring, and the causes which produce splitting. An investigation is also to be made of the present methods of harvesting, drying, dipping, sulphuring, packing, and the control of insects and mites in the stored product.

Capri Figs.—Since the successful establishment of the fig wasp in California the planting of Smyrna figs has been steadily increasing. Many foreign varieties of capri figs have been introduced into this country and a great many seedlings have originated here. The climatic conditions in California vary so widely that the capri figs act very differently. A variety which matures proficchi figs at Fresno in June may mature its fruit a month later somewhere else. A variety which harbors the fig insect throughout the year in one locality may lack continuity of cropping and thus allow the insects to die out in another locality. One variety is especially good for the mamme crop while another is especially prized on account of its proficchi crop. It is desirable therefore that sets or collections of varieties be worked out which will provide a continuous breeding ground for the insect. There is very little reliable printed information on this important subject available to the growers. Prof. Condit has undertaken therefore to make a careful study of the life history of the fig wasp on every variety of capri fig available and under different climatic conditions. The effect of caprifigation on Adriatic and other figs besides the Smyrna needs to be studied and measured more accurately than has been done heretofore. The number of insects harbored as well as the amount of pollen present in different varieties varies greatly.

It will probably be one or two years before the results of these investigations begin to appear as bulletins, but pending that time we are always glad to correspond with growers, giving them the latest information and results of our experiments. We wish our offices to become to a greater extent a clearing-

MISSION OLIVES

EARLY RIPENERS

THE EHMANN OLIVE CO.

Oroville, Cal., Nov. 17, 1916.
Mr. W. A. Hayne, Box 461, Marysville, Cal.
Dear Mr. Hayne: Answering your kind favor of the 15th, I am enclosing herewith photograph of some of this year's fruit on the Fogg grove, and you will note that they are above the average Mission. We also were able to harvest this entire crop before the frost, which shows that they are early ripeners.
We will be glad to keep in touch with you on this matter and if we can be of any further service, don't hesitate to let us know.
Yours very truly,

I propagated the Fogg orchard thirty years ago. The origin of the Fogg trees was directly from the old Mission at Santa Barbara. The trees I have now for sale are full brothers to the Fogg olive trees, and, like the Fogg trees, they are all propagated from the large size cuttings.

house of reliable fig information.

Our Tussle with Turkey.—The general increased interest in fig culture began about 1912 before there was any idea of a European War. Rather extensive acreage had been planted when the war began. The entrance of Turkey into the war and the blockade of the port of Smyrna stopped all importations of Smyrna figs into this country and greatly reduced the amount of figs available

for American markets. Before the war the United States usually imported about 10,000 tons of dried figs valued at the port of export at about one million dollars. Three-fourths of these came from Smyrna and the other fourth from Spain, Portugal, Greece, and a few from Italy. The British blockade did not include Turkish ports or interfere with fig shipments until 1916, when they were cut off entirely. We have secured some extra figs this year from Portugal and a few from Greece, but the total importations from all sources amounted to only 3576 tons, coming mostly from Greece and Portugal. We are therefore largely limited to our own fig crop, the size of which we do not know accurately, but which probably amounts at present to between 6 and 7 thousand tons with prospects of large increases in the near future when recently planted areas come into bearing. It is pretty clear, therefore, that most of our Eastern friends will have to eat California figs this year or go without. There is therefore a positively unique opportunity presented to the California fig industry.

USING VINES' RESERVE FOOD FOR GRAPES.

(Continued from First Page.) bearing ever since; and the original canes are some inches in diameter. At many of the nodes, they have rooted; and the annual pruning has made great warty heads along the vines.

The fruit is well spread out to sun and air. There is practically no mildew; though only one or two sulphurings are given. The grapes are not packed so close together that many berries must be shattered off in the picking. Wherever vines are too compact and foliage too thick, there coulure is worst. Though Mr. Hawley thinks that if he were planting a young vineyard, he would put the vines closer together, and prune in the ordinary way on account of the cultivation, his neighbor, Thos. Ballantyne, who has tried it, believes "there is no question as to the desirability of pruning this way on strong vines in strong soil." Nor did they gentlemen recommend it for weak vines in strong soil." Nor did the think it would work so well on old vines. Mr. Ballantyne pruned $\frac{3}{4}$ of an acre of Muscat grapes this way for three years and got over 2½ tons of raisins per year from the piece.

A move has been started by prominent farming interests in the Sacramento Valley to get the legislature to pass favorably on a weed bill which is being prepared. The bill calls for a yearly appropriation of \$5,000, a part of which will provide a yearly salary of \$2,400 for a deputy weed commissioner who will work under the direction of the State Horticultural Commissioner.

"Indian Corn and Its Culture" is the name of a bulletin being distributed free by the American Agricultural Chemical Co. of Boston, Mass. It was written by Dr. H. J. Wheeler, formerly director of the R. I. Expt. Sta. It goes at length into the requirements and the methods of cultivation practiced in the corn-growing States, and will be sent free.

Buying a Sprayer is like buying anything else. You might pay \$5.00 for a \$2.50 hat, but do you hope to ever buy a \$5.00 hat for \$2.50? When you buy a **HARDIE POWER SPRAYER** the price will be right, the sprayer will be right, and your satisfaction won't wear off with the years.

THE HARDIE MFG. CO.,
Portland, Ore.

Theo. Poindexter, State Agent,
336 Brannan St., San Francisco.

Nearly twenty years of effort to "make 'em better" every year, is what keeps Hardie Sprayers in the lead.

Bees Help to Make Prunes.

The division of pomology of the University College of Agriculture made an interesting experiment in the Santa Clara valley during 1916 to determine the relation of bees at blooming time to the setting of prunes. Details of results are given by A. H. Hendrickson, instructor in pomology in University Bulletin 274 just issued by the Station at Berkeley. The following is an outline of the experiment and the conclusions:

Two pairs of adjoining French and Imperial prune trees, as nearly as possible of the same age and size, were covered with tents of white mosquito bar. They were approximately 40 feet long, 25 feet wide, and 16 feet high, and constructed as nearly insect-proof as possible. Both tents were completed before any of the blossoms opened. As soon as 25 per cent of the blossoms had opened, a hive of bees was placed under one tent and kept there throughout the blossoming period (about five days in the season of 1916). All insects were excluded from the second tent, and a careful watch maintained to see that none entered. The tents were taken down after the petals of the blossoms had fallen and there was no danger of pollen being brought from outside sources to the trees in the experiment.

As soon as it was possible to tell how much fruit had set, it was evident that the French prune tree under the tent with the bees had set a much heavier crop than that of the best tree exposed to normal conditions. The French prune tree under the tent from which bees and all other insects were excluded, had set a very light crop. For some unaccountable reason, the Imperial tree under the tent with the bees set only a light crop of fruit. The Imperial tree under the tent from which all insects were excluded set but a few scattering fruits.

All trees were carefully watched throughout the season. At an early date it became necessary to prop the French prune tree which had been under the tent with the bees, to prevent serious damage to the tree by breaking the limbs. The difference in the amount of fruit set by the French prune which had been under the tent with the bees and the amount borne on the adjoining trees, all in the same state of thrift and having been given the same care, was easily apparent to even the casual ob-

server. Indeed, it was quite marked.

Approximately one thousand blossoms were counted and tagged on each tree. The record of the fruit resulting from these blossoms was kept, and from these results the percentage of fruit to set and mature was calculated. The following table gives the percentages of fruit that actually matured:

	No. of blossoms	No. of fruits in count April 1, 1916.....	Per cent. that matured Aug. 1, 1916.
French, with bees..	1069	193	18.05
French, no bees....	1058	11	1.04
French, outside set.	9891	359	3.59
Imperial, with bees	1080	18	1.69
Imperial, no bees..	1050	0	0
Imperial, outside set	2180	157	7.20

A glance at the table shows plainly that the amount of fruit set per one hundred blossoms on the French prune was much greater on the tree under the tent with the bees than on the trees under normal conditions. Only a very small percentage of fruit matured on the tree which had been covered by the tent from which all insects were excluded. In the case of the Imperial prunes, the tree under the tent with the bees set only a light percentage of fruit for reasons which are not as yet understood. The tree which was enclosed in the tent from which all insects were excluded set no fruit.

Since the results of the experiment have become known, considerable discussion has arisen as to the best method of testing out the work of bees in the various sections. Some growers are preparing to purchase a number of swarms of bees to have them permanently in their orchards; others expect to try to keep the bees in the foothill sections for most of the year, bringing them into the orchards during the blossoming period only; while others expect to try the plan adopted in parts of Southern California, where bee-men having large numbers of swarms are hired to place their bees for a certain length of time in the orange groves. It seems to be the prevailing opinion that the best work would result if the bees were brought in from some outside district and scattered about the orchards, about one hive to the acre, during the blossoming period, and then removed. Some of the growers are at present giving the latter plan serious consideration.

Intercrops Among Young Orchard.

[Written for Pacific Rural Press.]

For the first two years of a deciduous orchard's life in Imperial county, H. S. Reed, one of the most successful growers there, thinks cantaloupes are one of the very best summer intercrops. They shade the ground, and the frequent irrigation they require is good also for the trees. In his own orchard, he took off 228 crates of cantaloupes per acre when the trees were one and two years old, and followed them with a winter crop of Bermuda onions. Of these he got 240 crates per acre which sold at \$1.40 to \$1.55 per crate f. o. b. El Centro. The winter crop would be feasible many

years, but summer crops might suffer from too much shade later on.

Exhaustion of fertility is really out of Imperial Valley calculations, for each irrigation brings new silty soil onto the land; so whatever crops can be grown are not likely to injure the trees while water is available.

E. Steiner of the same county planted apricots on alfalfa land and grew 12 tons of watermelons per acre among them the first year among 600 trees. He picked about the same crop from them the second year; and in the third season, he got 50 sacks of spring potatoes per acre.

Thompsons Grafted on Zinfandels.

[Written for Pacific Rural Press.]

Of the 624 Zinfandel grapevines grafted to Thompson Seedless last spring by H. L. Wood of Stanislaus county, only four failed to grow; and all but about a dozen made fine growth through the season. We saw canes 14 feet long and picked a bunch of withered grapes from the grafts. They bore an average of a medium-sized bunch of grapes per vine in their first season of growth, according to Mr. Wood, who expects half a crop next year. There are 12 or 13 acres of Zinfandels yet, of which 4 or 5 will be grafted this coming spring and the rest later.

The scions were selected in January, mostly from some of Mr. Wood's own vines. Canes the size of a lead pencil made the best growth. They were cut half way between nodes, 8 to 12 inches long, making no distinction as to distance from the base, as the whole thing was an experiment anyway. Perhaps some of our readers have kept track of scions or cuttings from different distances from the base and have noted difference in growth or fruitage. We will be glad to hear from such.

When and How.—Sap was flowing and shoots had started a little when the grafting was done Mar. 26 or 27. The vines were five years old and two to four inches in diameter. It took Mr. Wood and another man 1½ days to do the entire job. They shoveled the dirt away so they could cut off each stump with a pruning saw, six inches underground. Each stump was split across with a wood chisel just enough so that the chisel could be used to pry the two halves of the stump slightly apart to receive the scions. After whittling two flat sides not quite parallel, near the end of each scion, one was put into each end of the cleft, with the thicker side crossing its cambium layer with that of the stock. Then the chisel was taken out, and in most cases the stump cleft closed tight onto the scions. In one case where the vine died, we found that one of the scions had barely started to make a union. One-half of the stump was so nearly split loose that it could easily be spread with the fingers. Except for this weakening, the splitting of the stub does not have the same dangers that accompany splitting the stub of a tree above ground where it often dries out. The clefts were not even trimmed.

No wax was used, but a paper was wrapped around each stub and folded over the top of it to exclude dirt from the cleft, but leaving the scion free.

As seen this winter, the scions had made good unions, their lower buds had sent out strong root systems; and the second buds had sent out one or two canes, many of which are of surprising length and diameter. In a large proportion of cases, both grafts took. Several inches of the top of each graft simply died and remains to show how much bigger this year's canes are.

The vine growth is on the ground now, but tall stakes have been set, and the vines will be put up on wires this winter. The weaker grafts, and the weaker canes on the

grafts that are left, will be cut out in the pruning.

SAVED SMYRNA BREBAS.

[Written for Pacific Rural Press.]

"I have had a very good crop of Smyrna figs this year, and my trees are only four years old," writes E. H. Erickson of Imperial county. He saved his breba crop last spring because when the figs were receptive

in the last part of April, his capri-figs were swarming with the insects necessary to pollinize them. The pseudocaria capris were ripe at that time and other varieties followed, bearing figs through the whole year so there are five to seven generations of the insects per year, according to Mr. Erickson. The Smyrna brebas ripened in May.

SULTANA TRELLIS.

To the Editor: What is the proper height to trellis Sultana grapes to get best results in fruit?—J. C. G., Wildomar.

The same as Thompson Seedless, two wires about three and five feet above the ground, the top wire being on top of the stakes to support the weight of fruit. See our Thompson article in issue Dec. 16, 1916.

C. W. Ward of the Cottage Garden Nurseries, Eureka, has been stopping in San Francisco for some weeks while getting shipping arrangements made. He anticipates a very heavy output of bulbs and ornamental stock this season and has opened a branch plant near San Jose.

Farm Adviser Work in Solano County.

[From annual report of J. W. Mills, Farm Adviser, Suisun.]

There are at the present time in Solano county practically no orchards being fertilized excepting a small area on which home-made stable manure is being used. This office has now under way demonstrations in seven different orchards, including Suisun and Vaca Valley. These include old orchards and those just coming into bearing. As it takes two or three years to make a practical demonstration and much time and patient record-keeping to get accurate data, the grower fails to get anywhere in the work. With the completion of this work, the growers will have definite knowledge as to how and what to do to increase the productiveness of their orchards.

Liming experiments on the grain lands near Rio Vista and Vallejo have been started, it having been discovered by this office that some of the fields even on the tops of the hills in the vicinity of Benicia and Vallejo have an acid soil which accounts in part at least for the light yield of grain and hay in those particular fields. Fertilizer experiments on the adobe lands near Rio Vista are being carried on to determine if the yields of wheat can be profitably increased by this method. New forage crops for the marsh lands are being introduced and tried. Fertilizers and lime demonstrations on the marsh lands are under way to determine if certain deficiencies in grain production can be corrected.

The rice demonstration at Miller's Station showed that rice culture in that section is as precarious as growing other grains, though a low yield of rice is reported from all sections of California.

It has been determined that the artichoke thistle can be exterminated by the application of distillate. Salt will do the work also if properly applied, but it has been found impracticable to get labor to persistently do it properly.

A Farm Land Loan Association has been established with duly elected officers, serving the north and east section of the county and covering loans to the amount of \$95,000. Two other associations are about completed, serving the western portion of the county and the marsh lands and covering loans to about the same amount.

The office has secured the services of thirteen government men for field investigations, has called the attention of the Federal Government to the existence of Hessian fly and stalk borer in the wheat-fields of Rio Vista and Vallejo with the result that a Federal expert is now located at Martinez to make a thorough investigation for the control of these insects.

One of the most important undertakings of the office is the organization of a swine breeders' association for the county with the object of securing a more uniform grade of stock and a co-operative marketing agency.

Through the educational work of specialists secured by the office, follow-up work and co-operation with the local veterinarians, hog cholera has been practically wiped out of the county, there having been but one

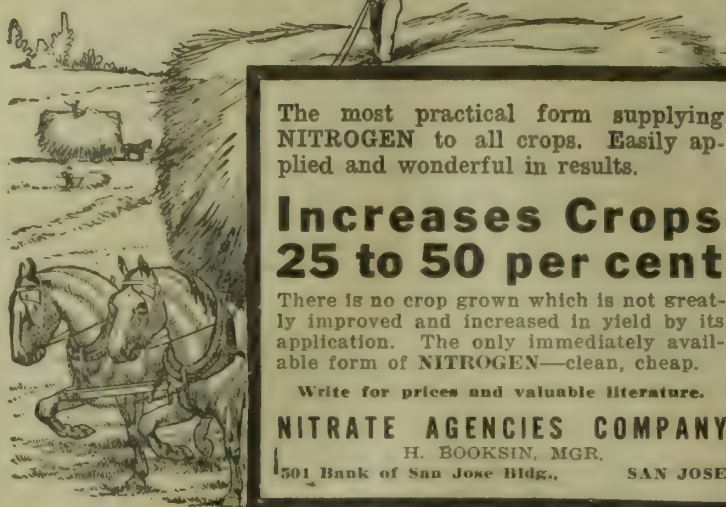

individual case of this disease located during the year.

Improved strains of wheat and barley have been placed on eight different farms in the county. There are two varieties of wheat and two of barley which have proved superior to all others at the State Farm at Davis. One is a selection of California-bred barley that yielded much heavier than any other variety and gives promise of making an excellent brewing barley, weighing 125 to 129 pounds per sack.

Some of the organizations formed last year in California by the aid of State Market Director Colonel Harris Weinstock, are: Peach Growers' Association, Poultry Producers of Central California, Poultry Producers of Southern California, Pacific Rice Growers' Association, California Associated Olive Growers, Delta Potato Growers, Northern California Fish Exchange, Western California Fish

Exchange, California Hop Growers' Association, State Distribution Bureau for Citrus Fruits, California Beekeepers.

Nitrate of Soda

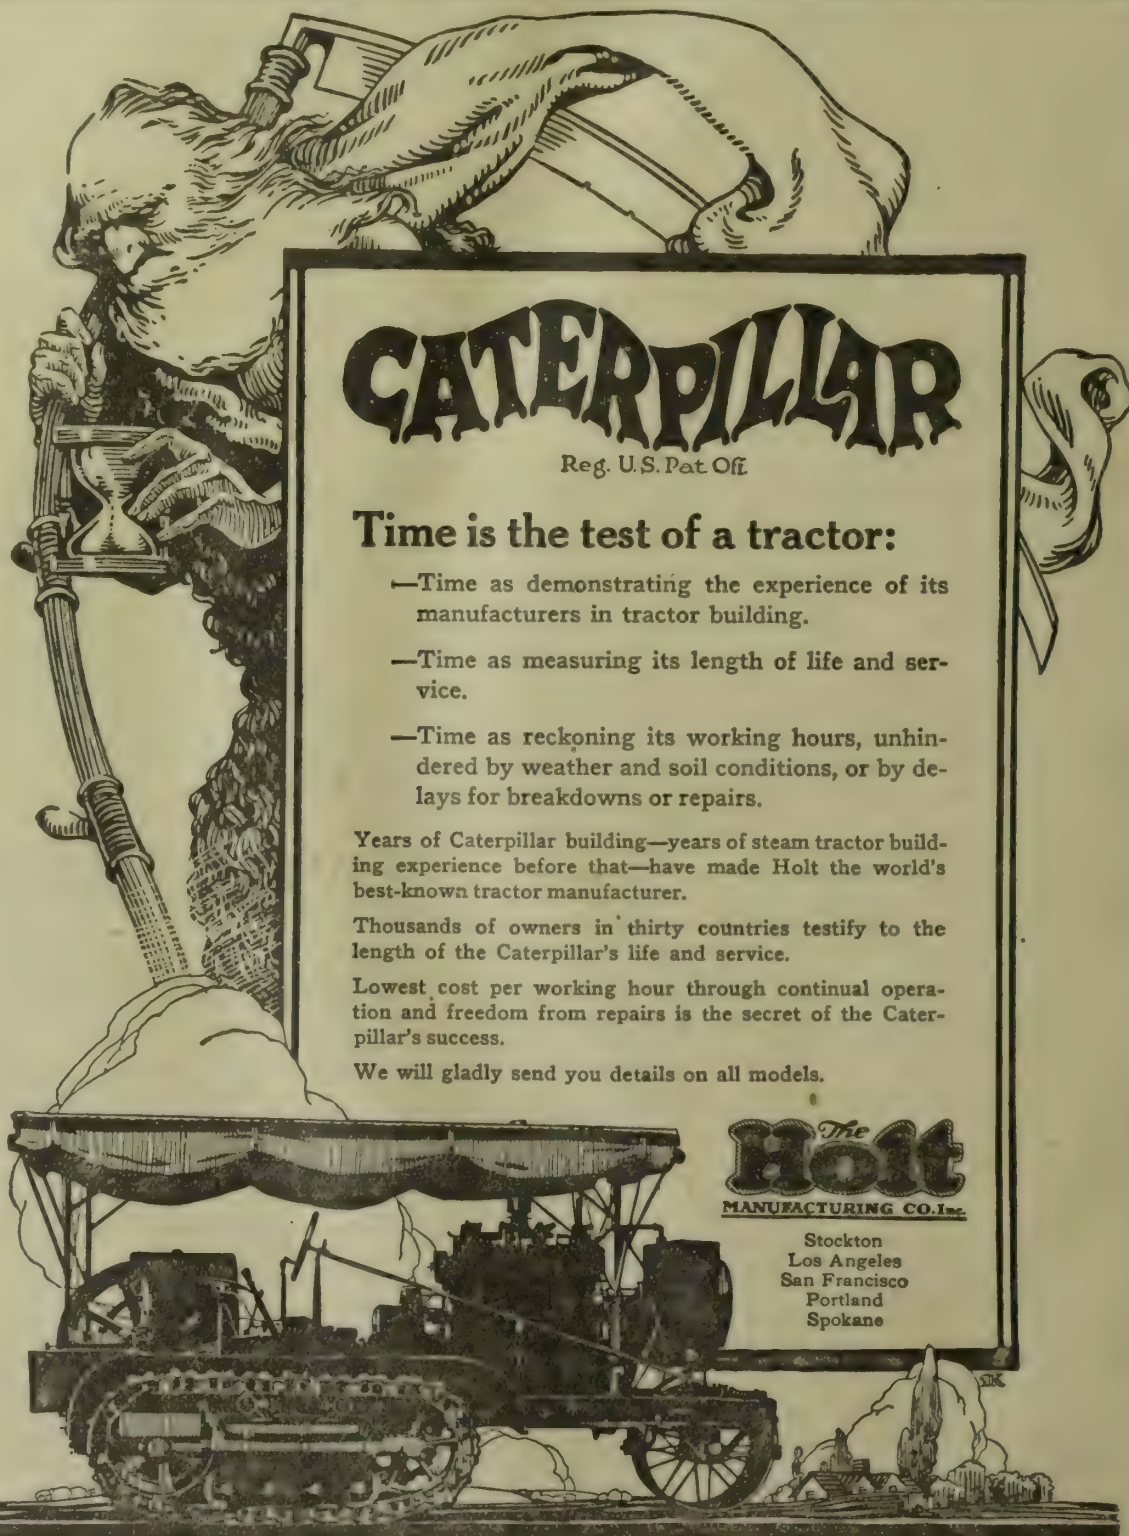

The most practical form supplying NITROGEN to all crops. Easily applied and wonderful in results.

Increases Crops 25 to 50 per cent

There is no crop grown which is not greatly improved and increased in yield by its application. The only immediately available form of NITROGEN—clean, cheap.

Paint Without Oil

Remarkable Discovery That Cuts
Down the Cost of Paint Seventy-
Five Per Cent.

A Free Trial Package is Mailed to
Everyone Who Writes.

A. L. Rice, a prominent manufacturer of
Adams, N. Y., has discovered a process of
making a new kind of paint without the use of
oil. He calls it Powderpaint. It comes in the
form of a dry powder and all that is required
is cold water to make a paint weather proof,
fire proof, sanitary and durable for outside or
inside painting. It is the cement principle ap-
plied to paint. It adheres to any surface,
wood, stone, or brick, spreads and looks like
oil paint and costs about one-fourth as much.
Write to Mr. A. L. Rice, Manufacturers, 146
North Street, Adams, N. Y., and he will send
you a free trial package; also color card and
full information showing you how you can
save a good many dollars. Write today.

SWEET POTATO ORCHARD INTERCROP.

[Written for Pacific Rural Press.]

A good income has been made for
the past three years since orange
trees were planted on the O. Hil-
bers ranch in Orange county, from
sweet potatoes planted each spring
between the rows on about 2½ acres
and other vegetables, etc., in other
parts of the orchard. The sweet po-
tatoes yielded about 1500 pounds
per row across the 20-acre piece.

Irrigation of the sweet potatoes
did not interfere with that of the
trees, for there were only four rows
in the 24-foot spaces between tree
rows. Water was run between sweet
potato rows and in three furrows be-
tween them and the trees on each
side. The soil is sandy with a hard
bottom six feet down.

Tubers were planted in a hotbed
some two months before they were
planted in April or May after frost
danger was over. If the plants get
too large, cutting them back does not
hurt them.

Ridges were made 30 inches apart
and the plants set on these about 16
inches apart. They were irrigated
and cultivated about six times. The
September irrigation for trees was
run through the outside furrow, but
not among the potatoes, for digging
proceeds from September until late
October whenever prices are good.
The vines continue green until frost
in November if not dug before; but
if frosted, should be cut off from the
sweet potatoes at once.

Ordinary potatoes will be grown
this year because they can be dug
earlier. Alfalfa has been grown for
two years in three centers to feed
the cow. It is kept several feet from
the trees and checked so it can be
irrigated independently. Furrows
outside the alfalfa supply water for
the trees.

EDUCATIONAL RICE CAM- PAIGN NEEDED.

[Written for Pacific Rural Press.]

The average consumption of rice
in the United States per inhabitant
during the year 1915 was 7 lbs.,
during the year 1916 it was but 5½
lbs. This reduction in consumption
is remarkable in view of the greatly
increased cost of other cereals and
reduced price of rice, all of which
demonstrates that if the California
rice growers are to obtain better
prices for their product they must
undertake an educational campaign
covering this State and adjacent ter-
ritory, which is the logical market.
Special attention should be given to
teaching our own people and those
of neighboring states how to prop-
erly and attractively serve California
rice, which is somewhat different
from that produced in the Southern
States and the Orient. The rice
growers of the Southern States have
raised a fund of \$100,000 to be used
to finance a campaign to encourage
the use of rice as a food. There are
at present about 10,000,000 sacks of
rice on hand in the United States.

A committee of the Placer County
Farm Bureau has been appointed to
look into the practicability of farm-
ers there leasing a lime deposit near
Clipper Gap. If this could be se-
cured it would solve the problem of
high-priced lime in that county.

Bigger Crops at Less Cost from Better Disking

All easily possible with
the right tool. Bigger
crops always follow bet-
ter diskling; and thorough
cultivation with one trip
over, instead of two, is a
worth-while saving in
cost. Are you using the
machine for better disk-
ing—that is the CUTAWAY
(CLARK) Double Action

Disk Harrow—the original double action
harrow? It's the farmer's greatest time
and labor-saver in his most important work.

Disk Before Plowing

as well as after, with a CUTAWAY (CLARK) Double
Action Disk Harrow; makes plowing easier, gives
better results. Every particle of soil is thoroughly stirred
because the rigid frame—a patented feature—forces the
rear disks to cut just between the furrows of the fore disks.

Cutaway Double Action (CLARK) Disk Harrows

penetrate deep because of the cutlery steel disks forged sharp.
The dust-proof, oil-soaked, hardwood bearings and perfect
balance make it noted as a light draft implement. If your
dealer hasn't the genuine CUTAWAY, write us direct. Send

Corn and Oats, Two Crops a Year.

[Written for Pacific Rural Press.]

Corn and oats keep ten acres busy summer and winter for John Edwards of Stanislaus county. The corn last fall filled a 120-ton silo heaping full and about three tons were left over. In December, 1915, he plowed a five-year alfalfa field, ran a smoothing harrow over it once, sowed vetch and oats at the rate of about 12 pounds to 90 respectively, and disked it in. Some of the vetch came up, but it got discouraged. Mr. Edwards thinks the ground was too soft and light for it.

About 3½ tons of oat hay per acre were cut late in May or early in June. It was taken off slowly, so that by the time the ground was irrigated and plowed, it was about June 20. Deep trenches were made where the corn rows were to be, using a shovel somewhat like a lister. A lister would be the right thing, but the investment then was not desirable. The corn was drilled into the bottoms of the furrows. When it was

knee high, it was irrigated thoroughly; and a cultivator turned dirt into the furrows, thus putting the roots deep underground, where they would have most moisture. Another irrigation came when the corn was beginning to silk and tassel. It was then too tall to cultivate and was laid by till cut for silage last October. There are spots here, as quite generally in California, where hardpan prevents the rise of underground moisture, and on these spots some of the corn leaves had dried up. In general, it was green when cut.

After the corn was off this fall about 100 pounds per acre of beardless barley was sowed late in November. Mr. Edwards hopes this will make hay two weeks earlier than the oats, and allow him to get the corn in earlier next year. In the year following, something else will be put onto this land, as he wants to rotate crops to prevent wearing out the soil.

Winter Truck Crop Estimates.

Frosts have seriously injured all tender vegetables in several districts of Florida, according to the Bureau of Crop Estimates of the U. S. Dept. of Agr. Much of the early lettuce in these sections is reported to be going to seed, but the largest part of the crop has been already shipped. Cabbage shipments are already under way from most districts, also celery.

One district in Virginia reports only about 65 per cent of a crop of cabbage and spinach, due to frosts. Strawberry acreage is reported short and outlook is for a short planting of potatoes.

Texas reports say 60 per cent of the cabbage crop was killed by December freeze and that lettuce will be somewhat later than usual. Ber-

muda onion plantings are not as early as usual because of weather conditions.

On Jan. 1 the cabbage crop of the large producing States was estimated at 81 per cent of normal, California's crop being set at 89 per cent. Celery was estimated to be 90 per cent of a full crop, the California crop being placed at 82 per cent. Lettuce was considered 75 per cent of a full crop, California's crop being estimated at 84 per cent. Onions indicate 87 per cent of a full crop, California having a 92 per cent crop. The report estimates the tomato crop of the various States at 87 per cent, that of California at 92 per cent, while strawberries average 88 per cent of crop for all the States as against 98 per cent for California.

Broadcasting vs. Drilling Grain.

[Written for Pacific Rural Press by E. W. Crow, Patterson.]

Several years ago I noticed that grain sown with a drill gave not always as good a stand as grain sown broadcast at the same time. The best reason for this I know is that most of the grain here is sown on summer fallow from Oct. 15 to Dec. 15, and several inches of the ground is generally dry near the top. Of course on good summer fallow there is considerable moisture down from 3 to 6 inches. Now, when the grain is sown with a drill it is covered up all the way from 1 to 2½ inches, and when the little showers of rain come the ground often wets down just deep enough to rot the seed drilled in, whereas the grain sown broadcast is not covered up so deep, and the shower wets it one day and the next day the sun and wind often dry the top enough so that the broadcasted grain does not sprout or rot. Now, two farmers I know who are both successful and practical have farmed here 30 or 40 years, and have made farming pay on a large scale. I notice they sow broadcast, whereas they used to sow with drills altogether.

You ask how much longer grain will be sown in this locality. That

depends altogether on circumstances. The majority of the grain is sown before Dec. 15, but I have seen good wheat grown here that was sown as late as Mar. 21. It all depends on the spring weather.

BLACKEYES FOLLOW OATS.

[Written for Pacific Rural Press.]

On the 7½-acre place in Stanislaus county belonging to J. W. Buchanan are 1800 two-year Thompson vines planted 8 by 9 feet apart, and open land enough to make about five solid acres of beans including two rows planted in the centers between grapevines. The bean check last season was \$319.19. The oat hay grown on the open part before beans were planted, sold for \$90. The oats had been planted Feb. 9 and were cut in May. The ground was flooded and about 100 pounds of beans planted. The beans were cultivated once this year. They were planted three rows per grape row last year, not cultivated at all, and yielded less than this season.

G. Katsura is installing a Layne & Bowler turbine centrifugal pump in his well near Parlier.

PURE ANIMAL MATTER
AMMONIATES

FOR CALIFORNIA SOILS

An ounce of Fertilizer Prevention is worth a pound of cure. It is easier, better and cheaper to keep your soil fertile and productive than to attempt to restore it after it has been exhausted by continuous cropping. Don't wait till your crops begin to fail. Use **Gold Bear Fertilizer---NOW!**

GOLD BEAR FERTILIZERS are made from animal products that contain the elements necessary to meet California soil conditions and crop necessities.

EUCALYPTUS TREES, SEWERS, AND SIDEWALKS.

To the Editor: Many eucalyptus trees in San Mateo county are being destroyed as being harmful to sidewalks, pavements, and sewers. Yet we see many sidewalks three years old, beside eucalyptus trees, and unharmed. Back in the East I have known of pavements under which all tree roots died. We would like to save our eucalypts.—L. A. B., Lomita Park.

[Answered by Supt. John McLaren of Golden Gate Park.]

Any large tree with strong, spreading roots will have a tendency to crack sidewalks. Unless the roots are pruned they will spread under the concrete.

Regarding the claim that, wherever eucalyptus roots are covered with a pavement five or more feet wide, they do not put out feeders, I am sure this is a mistake; but, where the stems of the eucalyptus trees are buried to a depth of four or five feet, it is sure death to the tree.

If there are any eucalyptus roots in the sewers, it is on account of defective sewer pipe, either in the laying or cementing the joints. The only way that I know of to keep roots out of sewers is to build good sewers.

FIGHT WIREWORMS BEFORE PLANTING.

To the Editor: Can you tell me of a remedy for keeping the little wireworms from eating potatoes while they are growing? Can you advise me where I can get American Wonder potato seed?—J. H. B., Modesto.

[Answered by W. V. Shear, Potato Specialist, Stockton.]

[The best time to fight wireworms is before the potatoes are planted, that is, get rid of the worms before putting the field into potatoes. The wireworms are most plentiful on old sod and the land should be plowed deeply and turned up to the air and kill all vegetation to drive the worms to other pastures. It is very difficult to entirely eradicate these animals the first season where land is seriously infested with them, in fact they are one of the difficult pests to handle, it being possible to protect potatoes from almost every other trouble. Thorough fitting of the land by plowing and disking several times, keeping it thoroughly dried out during the summer, seems to be the most satisfactory way of dealing with the wireworm, and this treatment is likely to be profitable also in obtaining better crops—that is, larger yields.

Nearly all dealers in potatoes handle the American Wonder.]

One of the largest land development propositions for 1917 will be that just commenced by the Layne & Bowler Corporation for the Sacramento Valley Colony Company of a large tract of land in Glenn and Tehama counties. This property is rapidly being subdivided and an individual pumping plant is being placed on each subdivision. It is expected that by the end of 1917 one hundred pumps will be delivering water for as many ranch owners on this tract.

Fresno county proposes to get rid of their ground squirrels. The county supervisors have passed an ordinance condemning all ground squirrels to death and will appoint a squirrel inspector to enforce the law.

JOHN DEERE IMPLEMENTS

BETTER FARM IMPLEMENTS AND HOW TO USE THEM

BOOK FREE 156 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars.

Describes and illustrates Plows for Tractors; Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain

Wagons; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders; Stackers; Rakes; Mowers and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills; Seeders; Grain and Corn Binders.

This book will be sent free to everyone stating what implements he is interested in and asking for Package No. X-152.

JOHN DEERE, MOLINE, ILL.

Van Brunt Grain Drills

Van Brunt Drills plant any small seed.

Amount sown per acre easily regulated.

Direct, double, gear drive from the continuous axle.

High-grade discs with bearings guaranteed to last lifetime of drill. Scrapers keep discs clean.

Pressure springs individually adjustable to make uniform depth furrows.

Either single or double discs.

Grass seeder attachment which will drill or sow broadcast can be furnished.

Van Brunt Drills are particularly noted for their adjustable gate force feed. Each feed cup plants exactly the same amount. The seed is compelled to leave the seed box in even, continuous streams without bunching or choking up. All the ground is seeded.

The Van Brunt Single Disc is the first successful single disc grain drill with closed delivery. The seed is protected by metal seed tubes, disc openers and the disc boots until it reaches the bottom of the furrow.

John Deere Spreader

The Spreader with the Beater on the Axle

Mounting the beater on the axle simplified the construction, eliminated troublesome parts and made possible a successful low-down spreader with big drive wheels. There are no shafts to get out of line, no chains to cause trouble, and no clutches to adjust. The only spreader with beater and beater drive mounted on axle.

Low down, with big drive wheels out of the way. Easy to load. Revolving rake, driven by manure moving toward the beater—no bunching of manure. Ball bearing eccentric apron drive—a new and exclusive driving device. Makes uniform spreading certain.

Wide spread attachment for spreading seven feet wide can be furnished for the John Deere Spreader. No chains or gears. Quickly removed.

New Deere Light Draft Gang Plow

The New Deere Gang is the most widely used plow of its type.

It is light draft, durable and is equipped with John Deere bottoms, known all over the world for superior work, easy scouring and light pulling qualities. It cuts and turns full width of furrow.

A simple, practical foot lift and auxiliary hand lift lever—easy to raise bottoms out of the ground.

John Deere Quick Detachable Shares—great labor and time savers. Share can be taken off easily, only one nut to remove.

For twenty years the New Deere Gang has had the good opinion of enough farmers to make it the one best seller—

And, today, it is the same plow it was twenty years ago, with the usual minor refinements added.

Correct in design, always representing the highest development of the plow-maker's art, the New Deere Gang is a leader, and has been every single year for twenty years.

Go to your John Deere dealer's and look this plow over—you will readily see why it is such a popular plow.

John Deere Plows for Light Tractors

So far as quality of John Deere Plows for Light Tractors is concerned, they are built for the farmer who realizes that it is business judgment to buy a high grade tractor plow. Don't forget that a tractor plow is not an everyday purchase.

John Deere Plows for Light Tractors are noted for their high grade work in the field—the real test of tractor plow value.

Before you make your purchase, be sure to see John Deere Plows for Light Tractors. A careful purchase means a permanent saving.

The John Deere Light Tractor Disc Plow works with any standard tractor—the hitch is adjustable.

Three or four discs. Discs have a double setting. Taking care of all conditions where a disc plow can be expected to operate.

Adjustable scrapers keep discs clean and lighten the draft.

No choking in trashy ground—frame is high, beams are dropped, which gives good clearance under the frame, and there is plenty of room between the discs for trash to pass through.

John Deere Model "B" Disc Harrow

Using a disc harrow before plowing pulverizes surface lumps, works trash into the seed bed and prevents

the escape of moisture. Then when the furrow slice is turned, the trash decays rapidly and no large air spaces are left between bottom of furrow and the turned furrow slice. Water in the subsoil can make its way into the seed bed and plant roots can penetrate to deeper soils.

Discing after plowing removes the weeds, and makes the seed bed compact, but not hard. The discs break up lumps of soil.

Discing after plowing removes the weeds, and makes the seed bed compact, but not hard. The discs break up lumps of soil.

Flexible—only that part of the Model "B" harrow passing over an obstruction is lifted out of the ground.

Rear section can be furnished to make a double action harrow.

John Deere Corn Planters

Accuracy in a corn planter means uniform drop—number of kernels the same in each and every hill.

If the planter misses only six kernels in every 100 hills, the loss in yield is nearly two bushels per acre.

Accuracy in planting has been the main object in designing John Deere planters. One of the many advantages of using a John Deere planter is that with proper handling it will plant practically 2, 3 or 4 kernels in every hill, as desired.

Merely move foot lever to change number of kernels per hill.

Drilling distances varied, and change hilling to drilling or back to hilling made easily.

JOHN DEERE, MOLINE, ILLINOIS

General Agricultural Review.

FIELD CROPS.

Sugar beet factories in Tulare county report that they have 20,000 acres signed up for the coming season, 4000 of which have already been planted.

An institute of gardeners and truck farmers was held at Riverside January 19 and 20 in an effort to aid in the diversification of agriculture in that county.

Farmers in Imperial county are being asked to plant broom corn by a Utah concern who promise to furnish the seed, advise as to best cultural methods and pay \$100 a ton for the crop.

The first car of lettuce for Eastern shipment from the Imperial Valley left Brawley January 18, a month earlier than usual. Last year 25 carloads of lettuce were shipped from Imperial county East.

According to figures recently compiled there were 60,000 acres of rice planted in California in 1916 as compared to 7,500 acres in 1913. Growers are being urged to plant in April, rather than delay as they did last season.

Five carloads of potatoes were shipped from Sebastopol lately at an average price of \$2 a cwt. A good many potatoes were grown in the Occidental, Freestone, Bodega, Valley Ford and Two Rock districts of Sonoma county last year.

A movement is on foot at Riverbank to have a sugar cane mill erected there during the coming year in time for this year's crop. Sugar cane has been grown there successfully, but to date no effort has been made to secure a custom mill.

Ralph D. Robertson, newly appointed Farm Adviser of San Joaquin county, has secured a new variety of cow peas which he believes will replace the blackeye. The lat-

ter named bean is objectionable because of the small black spot, in market circles.

A report from Chico states that the Dodge Rice Co. have been able to increase their yield of rice 50 per cent the past season because of better seed and methods employed by them. The report states that they have found a rice that will mature at least a month earlier than other varieties.

A contract was made last week between a Japanese hog grower of Sacramento and a New York firm whereby the Japanese grower agrees to deliver 100,000 pounds of first-class hops during 1917 for 10½ cents a pound. As the average cost of growing hops in the district is 10 cents the margin of profit is considered very low.

The Imperial Valley is going into the early strawberry business. It is announced from El Centro that the first raisers of strawberries last year made \$1,000 per acre. Hence ranchers are now going more extensively into the strawberry business. Berries raised in the valley come into market before the crop of the coast sections and command a good price. It is said that 190,105 strawberry plants were imported into the valley during December.

The Lima Bean Growers' Association has been forced to issue a circular announcing that it can deliver only 60 per cent of the amounts agreed upon because so many members shipped independently the major portion of their crops to brokers whose bids for the beans tempted them. The officers announce that "it is useless for us to state that in future years our contract with the growers will be such that they will absolutely be compelled to fulfill their part thereof."

DECIDUOUS FRUITS.

A large acreage of early and mid-season peaches is coming into bearing next season in San Diego county, according to Farm Adviser H. A. Weinland.

Buyers are offering nine and a half cents a pound for the 1917 crop of dried Calimyrna figs in the Reedley district, according to a report of one of our field men.

The Pioneer Fruit Co. have leased a site for a packing house at Livingston where they will operate in the green fruit buying business during the coming season.

Reports from Oroville state that about 700 acres will be planted to fruit in that section this season. Prunes will lead all other fruits, exceeding even the acreage of olives.

The California Prune and Apricot Growers Inc. have succeeded in securing subscriptions amounting to a half million dollars and ballots are being prepared for the election of directors as this is written.

As a result of a contract made with the California Packing Corporation, Wylie M. Giffen of Fresno will plant 320 acres of peaches in Merced county this spring. The contract price of \$20 and \$25 a ton for green fruit will remain in force 15 years.

Among other large holdings which are to be planted to figs in the San Joaquin valley during the coming planting season is a tract of 1,000 acres of the Bullard lands near Fresno. Nurseries are said to be finding the demand for fig trees heavier than they can fill.

An experiment conducted by Chas. J. Boin of Watsonville with apples stored in pasteboard boxes is said to offer conclusive proof that cold storage methods are unnecessary in preserving this fruit. Of the 1,000 apples stored only two dozen were rotted, after being held for four months.

It is said that peach pits have

saved Van Nuys from a fuel famine. The Vanomaar Producers' big cannery sacked and stored all from the big pack of peaches and apricots. Several tons of these pits were sold to an agent, who later informed the management that they were going to Germany for a chemical use.

Peach growers who are members of the California Peach Growers' Co. have been advised that arrangements have been made whereby they can sell their fruit to certain firms as green fruit without obtaining special permission from the company. These firms have agreed to turn any dried fruit they may have over to the association.

1916 BARLEY CROP SOLD.

Practically all of last year's crop of shipping barley has been bought and either used or shipped East. The large order filled by the E. C. Horst Co. during the past week took all of the small lots left in the State. The price this week at San Francisco has been around \$2.32 per hundred for shipping barley.

The hay crop in parts of the State has been all consumed, and owing to scarcity of pasture, feeders are running short. In the Sacramento valley baled hay is bringing \$15 per ton.

SAN DIEGO RURAL CREDITS ORGANIZATION.

Twelve rural credits associations in San Diego county consisting of 302 members who desire to borrow \$850,000, have adopted articles of association and their local loan committees are making appraisements. That these appraisements are conservative seems indicated by the kicks which come to Farm Adviser Weinland from would-be borrowers. One lady who valued her property at \$10,000 will be able to borrow on a valuation of only \$2,000. Preliminary application blanks give basis for an estimate that half to two-thirds of the loans are to clear mortgages bearing higher interest. One man's mortgage matured last November and he was obliged to renew it for three years at 10 per cent. He tried to have it payable

"on or before," but the mortgage holder insists on three more years of 10 per cent interest.

PLACE CITRUS CROP AT 50,000 CARS.

In its annual estimate of citrus fruit production the Riverside Press estimates the crop in Southern California to be 37,000 cars of oranges and 7,815 cars of lemons for the season of 1916-17. This is an approximate increase of 20 per cent on the orange crop and 15 per cent on the lemon crop over last season. The crop in the Northern California districts is estimated at 6150 cars of oranges and 185 cars of lemons, making a grand total of 50,000 cars of citrus fruit for the State. The detailed estimates and reports are as follows:

	Cars Oranges.	Cars Lemons.
Pomona district ...	4,700	300
Redlands district ..	4,150	...
Riverside district ..	3,400	500

ALFALFA

250 lbs. of Mococo Superphosphate per acre will increase the yield of alfalfa enormously. "In some cases the alfalfa growth has been tripled," writes Mr. F. F. Lyons, San Joaquin Co. Farm Adviser. Write for particulars.
THE MOUNTAIN COPPER CO. 332 Pine Street, San Francisco.

"THE LITTLE FELLOW WITH THE BIG PULL"

15-35 Model E---Burns Kerosene

THE recognized standard of excellence in tractor construction is found in our Model E. This fact is endorsed by hundreds of users, and admitted by all engineers who are familiar with its construction.

Tractors can give only the service that is built into them. They are called upon to endure strains no other machine is expected to stand; to do their work under conditions that rack and tear any machine with a weak spot.

It is essential, therefore, that they be built of the best possible materials, by the most skilled workmen, after designs originated by the highest engineering ability, and then proved most rigidly in actual field service.

Real performance cannot be assured in untried, hasty designs or cheap construction with which the market is flooded. The Sandusky Tractor is built for service, durability and economy, and represents the greatest attainment in tractor building yet accom-

plished. You buy tractor certainty when you purchase the Sandusky.

It is sold on a guaranteed basis, after an actual demonstration on your own farm has shown that it is adapted to your needs and capable of doing your work, whether that be plowing, harrowing, discing, harvesting, hauling, threshing, filling the silo, shredding fodder, sawing wood, making roads or operating any belt machinery.

Brief Specifications

Our own four-cylinder, four-cycle 5 x 6½ heavy duty, slow speed, vertical motor; positive self-contained combination force feed and splash oiling system; Bennett air cleaner; three speed selective transmission, 2 to 5½ miles per hour with direct drive on low; ideal three-point spring suspension; all steel construction; small over-all dimensions and short turning brakes; easily handled; surplus cooling capacity.

A NEW PLAN—FREE SERVICE

We announce an entirely new departure in tractor selling. A coupon book for 200 hours of service goes with every Model E. This means expert service and help without charge when you want it. See catalog for details.

Our Binding Guarantee

We guarantee The Sandusky Tractor full 15 horsepower at the drawbar and 35 on the belt pulley; capable of handling at least four 14-inch moldboard plows eight inches deep where a big team can pull a 12-inch plow six inches deep; to run belt machinery up to a 32-inch separator; to have one-third reserve over its drawbar rating, and for one year against defective workmanship and material.

BOOK E-132FREE—A 40 page book which fully describes and illustrates the distinctive design, high grade construction and exceptional ability of the Sandusky Tractor. A copy will be mailed you upon request.

If the Model E is too large for your requirements, let us send you information covering our 10-20 Model J. Ask for booklet J 132

Dak.; Fargo, N. Dak.; Sioux City, Iowa; Lincoln, Nebr.; Wichita, Kans.; Dallas, Texas; Leesburg, Fla.; Los Angeles, Cal.; Sacramento, Cal.

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

ELECTRICITY AND GAS ENGINES.

[Written for Pacific Rural Press by C. C. Cowin, from Data Furnished by F. S. Myrtle of the Pacific Gas and Electric Co.]

The individual Californian on the average uses electricity more generally than the people of our other States. Two natural advantages, our waterfalls and our oil fields, make this possible.

The evidence of this condition is confirmed by the large sale of electric lights, electric appliances, electric ranges, and machinery which are used about the farm and home. That a very large percentage of California homes are using electrical appliances is evidenced by the following tabulation of approximate annual sale:

Electric Irons 17000 yearly
Electric toasters ... 2700 "
Electric percolators,
tea pots, etc. 6700 "
Portable electric vacuum
cleaners 5500 "
Electric washing machines
..... 5000 "
Electric ranges—probably
..... 1500 next year

Little motors are purchased for driving sewing machines, etc. The women on the farms seem to appreciate electricity even more than those in the city. To date there are 2000 electric ranges in use in California homes.

In our rural communities we have a condition equalled nowhere else in the world. A recent census developed the fact that in December, 1915, 12,000 motors were in use on California farms.

The U. S. census for California in 1909 shows that only 143,000 electrical horsepower was used in our State for all purposes; and our farmers hardly knew what an electric motor was.

This, in a measure, is solving the hired man problem for the farmers, for electricity is dependable and ready to work twenty-four hours a day at any time during the year. It is a conservative estimate to say that the electrical manufacturers, jobbers, and dealers have distributed to the California farmers during the past few years some fifteen or twenty million dollars of electrical appliances, lamps, and machinery.

In the December, 1915, census, fourteen large power companies reported that 190,441 electrical horsepower was used on the farm. The number of farms using electricity was given by all but five of the companies, and was 7509; approximately the total number of installations for all fourteen companies was 8850.

Many say that this is a condition peculiar to California due to the fact that the interior of our State is semi-arid, and is not possible elsewhere. About 170,000 h.p. is for irrigation and reclamation; it must not be overlooked that the remaining 20,000 h.p. which is used for miscellaneous purposes on the farm is no small figure.

Gas Engines.—Have you ever made a survey in your rural communities to ascertain just how many gas engines there are per square mile?

Some surprising figures are liable to be acquired, because right here in California, where "electricity on the farm" is a great reality, one of the central stations, which has been particularly active in the development of rural business, recently made a survey of this character to determine how many gas engines were within one mile of each side of their lines. To their great surprise they found that there were some 14,000 h.p. in engines.

It has been said by some that the farmers are not responsive to modern labor-saving devices and conveniences. But experience in California has taught us that the farmers buy more readily electrical appliances and current consuming devices than do the city people; and the farmers already have a desire for electricity.

GROWING USE OF WATER POWER.

Twenty new water-power projects which utilize National Forest land began operation in the fiscal year 1916, says Henry S. Graves, Chief of the Forest Service, in his annual report. This was an increase of 18½ per cent in the total number. In the fiscal year 1915 the number of new projects which began operation was twelve. Forty-two per cent of the developed water-power projects of the United States utilize National Forest land, the Forest Service figures show.

Development of relatively small projects is particularly in evidence, according to Graves, in the Rocky Mountain States.

California leads in the amount of power under permit and in operation. The number of transmissions-line permits in effect was increased by thirteen during the year. The forty applications for power-project permits received in 1916 included eight from Alaska—a notable evidence, according to the report, of increased local interest in power development on National Forest lands there.

Concerning the report prepared by the Forest Service in response to a resolution of the Senate calling upon the Secretary of Agriculture for information regarding the ownership and control of water-power sites and any facts bearing on the question as to the existence of a monopoly in the ownership and control of hydroelectric power in the United States, Graves says:

"This report presented, in far greater detail than has ever been attempted before, an exhaustive analysis of the general situation. It showed a marked concentration of definite and complete control of a large percentage of developed water power by a very few companies. Data presented regarding interrelationships through common directors indicated a marked tendency toward association or community of interests, particularly between the principal holding companies. The movement toward concentration in commercial central stations of all the

LAYNE & BOWLER PUMPS

Preferred By Up-to-Date Irrigators

Because of the perfect service Layne and Bowler Pumps are capable of rendering even when operating under the most trying circumstances, the leading irrigators in the West have selected them in preference to all other makes. Years of successful experience in pump manufacture are embodied in Layne and Bowler Pumps. They are as perfect as human ingenuity can make them. Remarkably simple in construction—nothing to get out of order. Easily operated.

Our free Pump Catalog should be in the hands of every rancher. Write for Your copy. Ask for Booklet No. 25.

P&O

LIGHT DRAFT PLOWS

Built for the Field Test.

Three-Quarters of a Century of "Knowing How" Hammered Into Every One of Them.

The product of the Parlin & Orendorff Co. has always been noted for simplicity of construction, great strength and ease of operation. It was upon such a basis that the founders of this business made their implements, established their reputation, and built their factory. It is upon the same foundation that the business has been carried on to this day, and in 1917 we celebrate our Diamond Jubilee; 75 years of practical experience gained through constantly striving to provide for the exacting requirements of three generations of American farmers.

For an even three-quarters of a century we have met the demand, and today we operate the largest and oldest permanently established plow factory in the whole world. "It's the way we build them."

Light Draft Plows, Harrows, Planters and Cultivators are made in all types and sizes, to meet the conditions in all sections, and are Backed by an Unqualified Guarantee.

We also make the most complete line of Tractor Engine Plows produced, and we have a special catalog devoted to these famous plows.

The P&O Little Genius Engine Gang Plow

was the most popular plow shown at all points on the 1916 National Tractor Demonstration.

We will send P&O Catalogs to any address. While P&O Implements are sold only through established implement dealers, we welcome correspondence from farmers in all sections.

primary power employed in the electrical industries and in manufactures was found in all sections of the United States, the rate of concentration during the period 1902-1912 being highest in the South Atlantic States and the extent of concentration greatest in the Western States.

Waterpower Increase.—"The rate of increase in waterpower development for public service use from 1902-1912 was approximately three times as great as in steam power. The development per capita of the Western States in 1912 was two and a half times as great as in other parts of the country. The report showed a considerable overdevelopment in nearly all the power centers of the Western States—California, Oregon, and Washington in particular showing installations far in excess of maximum demands."

TRACTOR ON GRAIN RANCH.

[Written for Pacific Rural Press.]

It used to take Baird Bros. of Yolo county 30 to 35 days to harvest their 1100 acres of grain with mule stock, but they got disgusted trying to hire competent men even at the higher wages. "They wanted big pay, but would not attend to the stock right, even then," says Mr. Baird.

In 1911 they bought a 60 h.p. tractor and have used it ever since, with very little repairs. The first year they harvested the 1100 acres in 35 days, aiming to quit at sundown and begin when dry enough in the morning. Gas consumption averaged 33 gallons per day. Every summer since then they have run the tractor for their own and a very little outside work, and have lost only one-half day in the busy times.

They plow and harrow their grain land, and harvest the grain besides four or five days' stationary alfalfa threshing per season. They had 25 acres of their own for seed last season and threshed some for neighbors; and sawed wood, too. On stationary work, gas consumption is figured in proportion to work done, as the engine is never worked up to capacity, and no power is lost in moving the tractor itself. A house mover got stuck in a swale last spring and the Baird Bros.' tractor pulled the house onto firm footing.

Some dry plowing is done; but with the big tractor, they can wait until the foul weeds are well started by early rains; then they plow and harrow day and night. Some 600 acres are fall-plowed and winter-sown, mostly with barley, but some with wheat.

Their land is in two ranches, one with lighter soil than the other. On the former, the tractor pulled 16 ten-inch plows six inches deep. On the latter, only a 10-foot strip is plowed at once. At the first harrowing, the spot-light is focussed on the edge of the harrowed ground; but the cross harrowing has to be done by daylight. Occasionally they summer fallow some land as they did last year.

Soil Packing does not worry Baird Bros. for they hitch a little cultivator to the bar behind each track, which digs it up after the tractor has run over the soil. But even so, the track marks show in the grain; for there is the best grain. "The tractor will go over any ground that is fit to work," says Mr. Baird.

The Dependable Hired Man

If you had a hired man available at any hour of the day or night—ready for all kinds of work, in the house, in the barn or out in the field—your greatest trouble would be over.

State Dairy Cow Competition, December.

[Written for Pacific Rural Press.]

With one of the cows which was entered in the California State Dairy Cow Competition during December breaking the State record for the monthly production of butterfat, and 63 per cent of all cows entered averaging over 60 pounds of fat each, the real work of the contest may be said to have just started.

Numerically there were more Holsteins entered during December than of any other breed, the totals of those producing over 40 pounds of fat being as follows: 19 Holsteins, 16 grades, 13 Jerseys, 7 Guernseys and 2 Ayrshires. As many of the cows which are to be entered have not as yet freshened, these numbers are expected to be greatly enlarged in future months.

Not only did Holsteins lead in numbers but in production also, the 19 head averaging 1985.2 pounds of milk containing 75.39 pounds fat as compared to 1494.6 pounds milk and 60.34 pounds fat average for two Ayrshires; 1214.5 pounds milk 59.20 pounds fat average for 7 Guernseys; 1412.8 pounds milk 55.8

pounds fat average for 16 grades and 879.9 pounds milk 47.50 pounds fat average for 13 Jerseys.

A noticeable point in the above figures is the relatively high average production of grade cows, which indicates that owners of grade herds who are competing have used good judgment in selecting high-producing animals from their herds for this contest. Another point of interest in the figures on grade cows is their average test of 4.04 per cent, indicating that there has been an intelligent infusion of blood as a rule among these herds with the aim of securing a good average test rather than an extremely high or low test.

The average butterfat test of the various breeds was as follows: Holsteins 3.89 per cent, Ayrshires 4.38 per cent, Guernseys 4.92 per cent and Jerseys 5.64 per cent. Without exception these averages are higher than claimed by the various record associations.

The production of the 57 highest producing cows as well as their owners' names follow:

Proposal to Pay for Reacting Cows.

With the increasing importance which is being given to tuberculin testing in California, largely through the dairy laws which went into effect last October, it is of interest to know that steps are being taken by the U. S. Government to provide compensation to owners of reacting cows.

In outlining the government's policy in this regard, D. F. Huston, Secretary of Agriculture, writes as follows: "It is not thought that much permanent headway will be made in securing the co-operation of cattle owners unless some reim-

bursement is made for cattle destroyed. Under the plan followed in the District of Columbia cattle which react are first appraised and then slaughtered. If no lesions of tuberculosis are found, the owner receives the full appraised value. If lesions are found but the carcass is not affected to such an extent as to destroy the value of the meat for food purposes, the owner receives 80 per cent of the appraised value less the salvage. In case the carcass is so badly affected as to require destruction, the owner receives 40 per cent less the salvage. This has been

California State Butter Record Broken

by a daughter of

KING MEAD of RIVERSIDE

Butter 7 days 35.36—Butter 30 days 142.39—Average % 4.5.

This is the record just made by Anggie Acme of Riverside 2nd.

If you want a bull that will transmit—

HEAVY PRODUCTION—HIGH TEST—GOOD TYPE,

your best opportunity is in a son of **KING MEAD OF RIVERSIDE.** Our claims for high per cent of fat are not based upon abnormal seven-day tests, but on the average test of his daughters for the year.

His first five two-year-olds tested for the year average 14,325 pounds milk, 721 pounds butter and 4% butter fat. Two of these made over 21 pounds in seven days, and with second calves have made from 26.17 to 28.46.

We can now offer a beautiful son of King Mead of Riverside from a three-quarter sister to Arallia De Kol, 28,000 pounds milk and 1142 pounds butter. His dam made 810 pounds butter from 19,352 pounds milk in a year.

The calf is an 87½% brother to Arallia De Kol Mead, that holds the highest two-year-old butter record in California, 870.61 pounds butter from 16,669 pounds milk, average test 4.18. Born May 28, 1916. An outstanding individual.

Price and pedigree by request. We are sold out of serviceable bulls and you had better buy now if you need a bull for spring service.

A. W. Morris & Sons
WOODLAND, CALIFORNIA

Breed for Butterfat

Beryl Clothilde Hengerveld,
Champion in Butter-fat Contest,
Sacramento, 5-day record, 21.11
pounds, test 4.7 per cent.

The quickest and surest way to make your Holstein herd more profitable in spite of high cost of feed is to introduce blood from high-testing ancestry.

My herd has a larger percentage of high-testing cows than any other herd in the State.

My young herd bull, **DUTCHLAND SIR PIETERTJE CREAMELLE**, has high-test breeding, and is transmitting this breeding to his sons and daughters. Five tested daughters have records averaging 21 pounds, all testing better than 4%. One of these, **Clothilde Pontiac Creamelle**, is California Champion 2-year-old, with a record of 22.52 pounds at 2 years 1 month; test 4.72%.

Have a few fine young bulls that will soon be ready for service.

WILSON'S

968-970 Market St., San Francisco

these cattle are slaughtered at the owner's expense, but in some instances where the animals are of great value they have been segregated and used for breeding purposes only. If co-operation with the States is undertaken, it should be on the half-and-half plan and the work should be confined to certain definite sections, such as one or two counties at a time, with extension to other counties as the work progresses. The magnitude of the task should be fully understood before the work is begun. There are approximately 22 million dairy cattle in the United States. It would be necessary to re-test herds at intervals of six months until all disease was eradicated. All new cattle added to tested herds would require testing unless from herds known to be clean."

As Wm. T. Creasy, Secretary of the National Dairy Union, points out, whether we agree or not on the tuberculin test, all agree that slaughtered animals should be paid for, and the State Legislature should take the matter up and make the necessary appropriations to start the work so that by another year the government's half-and-half proposition can be accepted.

This might be a good thought for some of the legislators from dairy districts who try so hard to make a hit with their constituents by introducing bills affecting the dairy business. The passage of a tuberculosis compensation bill would surely be a vote-getter for these able gentlemen next election, at least among the dairymen.

COWS LOSE MINERALS FROM THEIR BODIES.

Dairy cows ordinarily cannot digest from rations of the usual character sufficient mineral matter to meet the demands made by heavy milk production. This conclusion has been reached by nutrition experts at the Ohio Experiment Station after two years' investigations with cows yielding large quantities of milk. These specialists also say that even when the common practical rations are supplemented with large amounts of calcium carbonate and bone flour, the cows still give off more lime than they can digest from their rations. To meet this demand for heavy milk production the cows must draw upon the mineral substance of their skeletons. Further attempt is being made, by the use of more readily soluble lime salts, to learn whether a cow can absorb as much lime as she gives off during heavy milk production. The results obtained thus far emphasize the value of leguminous roughages in milk production. Without liberal allowance of such feeds the loss of minerals from the bones becomes excessive, and predisposes to disorders of nutrition.

THAT STATE DAIRY LAW AGAIN.

To the Editor: Under the State law is it necessary to have cows tuberculin tested in order to sell cream to creameries? If they are so tested is it necessary to pasteurize the milk if you wish to sell it fresh? Is the State Veterinarian supposed to do the testing and about what does it cost?—L. W. R., Winters.

We certainly thought we had made this law plain enough to sub-

Life Time Engines

scribers in past issues. No, you don't have to have your cows tested or the milk pasteurized in order to sell cream to creameries. Neither do you have to pasteurize your milk when sold fresh, if your herd has been tested and passed by the State Veterinarian or his deputies. The testing is done free of charge by Dr.

Keane, or his assistants, whose address is State Veterinarian, Sacramento.—Eds.

If any of the ewes are not in good condition, separate them from the rest of the flocks and give them extra care until they are in form to return.

Swine Breeders Urge Better Markets.

[Written for Pacific Rural Press by Cuthbert Powell, Los Angeles.]

With a highly representative delegation from all parts of California and several out-of-State visitors the annual meeting of the California Swine Breeders' Ass'n held at Los Angeles January 18-19 was the best attended meeting ever held by that association.

In calling the meeting to order President C. B. Cunningham reviewed the history of the association as well as of the swine industry in California since the association was founded. From a membership of 30 he stated that the association had increased its membership to about 300. He said it was a healthy sign to see such a general interest taken in breeding up the hogs of the State as it meant greater success and more money to the hog raisers. He hoped the good work thus begun would be pushed along until all the scrub hogs had been replaced by better blood and the scrub and razor-back eliminated altogether.

James Hill of Hamilton advocated purebred hogs of a type adapted to one's location, undivided care and attention, and feed that will produce the greatest number of pounds of meat for the feed consumed. He believes that by holding hogs raised in this manner till they are "ripe" for the market their returns will be entirely satisfactory.

In speaking on "Feeding, Growing and Marketing Hogs" L. L. Lamson of Holtville said that you must first feed your hogs so that they will put on the most flesh for the amount of feed given them and that after you have them ready for the market you must find a buyer that appreciates your type of hog.

Are California Prices Lower?—In a paper prepared for the meeting by F. L. Washburn, manager of the Western Meat Co. of San Francisco, who was unable to attend, he was positive in the assertion that the price of swine in California is no

lower, on the average, than in either Oregon or in the Middle Western States. He also took exception to the inference that there is something radically wrong with the conditions under which our hogs are marketed, that the packer may have much to apologize for, and possibly a profit out of proportion to those of the grower.

By reference to the year book of Swift and Co. recently issued, Mr. Washburn pointed out that their actual payments per cwt. at all plants for hogs during the year 1916 was \$8.49, while the average paying price of the Western Meat Co. for the same period was \$8.43, a difference of only six cents per cwt., or between 10 and 12 cents. He also stated that the average price paid at all of the Swift plants for live hogs during 1915 was \$7.09, the identical cost of the entire purchases of his company for the same year.

Analyzing the price situation still further, Mr. Washburn quoted from a recent bulletin of the U. S. Dept. of Agr. which gave the average market price for hogs throughout the United States as \$7.40 for the year 1916 and \$6.10 for the year 1915. This, he stated, shows that the average paying price of his concern has been more than a cent higher than the average market price throughout the country, notwithstanding that his company's figures include the cost of all lightweights and other undesirable stock.

Progress Shown.—It has only been during the past two years that any progress has been made in California pork raising, according to Mr. Washburn, the records of his company showing average weekly receipts for 1915-16 of slightly more than double the average weekly receipts of the previous eight years. But even then, no Pacific Coast packer is doing a business large enough to be placed in the same class with the smaller plants of the Middle West.

During 1915 the weight of hogs received by his company averaged 179 pounds, and in 1916 but 176 pounds, fully 20 pounds under the desirable weight for packing purposes. Also because of the great number of light unfinished hogs that are being marketed the average yield for 1916 was only 75.1 per cent as

compared to 76 per cent for 1915.

Not Pork Eaters.—Because Californians are comparatively small eaters of pork, unless it be bacon or ham which is but 25 per cent of the hog, coast packers have a very poor market for pork loins, trimmings, tongues, spareribs, neck and back, bones, kidneys, tails, leaf lard, boneless ham butts and shoulders. Because of this the Western Meat Co. have been compelled to ship considerable quantities of frozen pork East, with a freight and icing charge of \$2.35 per cwt. on the net weight shipped.

Light Weights.—Another disturbing factor to packers is the comparatively large business done by retail butchers in the so-called "block hog," whose dressed weight is from 90 to 125 pounds, too small a hog to make a satisfactory packing carcass.

This type of hogs usually sells at one to one and a half cents, live weight, under the price of heavier hogs, and is a further handicap to the packer, as the retailer, who might otherwise be using fresh pork cuts, is able to buy these cheap dressed hogs and work off the small cuts fresh to his trade. Such a large percentage of the fresh pork consumed in the past has come from these hogs, which weigh 130 to 140 pounds live weight, that the producer has sold his hogs at comparatively small expense.

The packer cannot afford to handle extremely light hogs because the cuts, when cured and smoked, are not merchantable as No. 1 stock because of their undesirable shriveled appearance, also the dressing percentage decreases in accordance with the weight of the animal.

Condemnation.—Cholera losses have not been important lately at the Western Meat Company's plant, indicating that it is under good control, but loss from tuberculosis is such a serious menace that for the past year this company has been charging one-half of the condemnation to the shipper, the company assuming the other half, after allowing full credits for salvage. During 1916 the reports of the Government inspection service showed a total of 25,751 head retained as suspects, or three and two-tenths per cent of all hogs slaughtered. Of this number two and two-tenths were condemned for grease and one per cent for sterilization, this company being unable to use this sterilization privilege advantageously.

Distributing Troubles.—Because of freight rates California packers do no business in pork products outside the State except in a comparatively small section of Nevada and Arizona, while the Middle Western packers have two-thirds of the country's population to draw on. Besides this the heavy demand for pork products from the war zone, especially from Belgium, which has existed for the past two years, and the remarkable demand from manufacturing centers in particular and the whole country in general, has given Middle Western packers an additional advantage over Western concerns inasmuch as none of these factors have benefited the latter concerns on account of freight handicaps.

Needed Education.—Consumers in California still favor Eastern smoked meats because of old standing preju-

Public Sale of Berkshire Hogs

40 Head Selected from
Prominent Western Herds.

Thursday Feb. 15

DAVIS, CALIFORNIA
On University Farm,
under the auspices of

**The
Western Berkshire
Congress**

Consignments of the choicest
animals from such herds as:

Dean Beeman, Woodland, Cal.
D. C. Bunn, Prosser, Wash.
Butte City Ranch, Butte City, Cal.
Clark Bros., Prosser, Wash.
F. L. and L. S. Hall, Ferris, Cal.
A. B. Humphrey, Mayhew, Cal.
James Mills Orchards Corp., Hamilton City, Cal.
H. L. & E. H. Murphy, Perkins, Cal.
Oak Grove Dairy Farm, Woodland, Cal.
Arlington M. Smith, Visalia, Cal.
Chas. M. Talmadge, Newport, Wash.
University of California, Davis, Cal.
Whitehall Estates, Tracy, Cal.
Winona Ranch, Grants Pass, Ore.
Geo. M. York & Sons, Modesto, Cal.

This sale will be preceded by a two days' meeting. Every man interested in Berkshires, or in pure-bred and "better" hogs, is cordially invited to attend the meeting and sale. Both meeting and sale held on the University Farm at Davis, Cal.

For further particulars, Catalogue, etc., address either

W. S. GUILFORD, Pres.,
Butte City, Calif.

or
F. R. STEEL, Sec'y.,
Grants Pass, Ore.

BASSETT'S POLAND CHINAS

For many years, at
widely separated
show rings, under
many different judges
of varying type ideals,
my Poland Chinas
have been consistent
prize-winners. My
herd is large, and I
cull closely. The
animals sent out as
breeders are the very
tops of a large number.
I KNOW that
my kind of Poland
China is a profitable
farmer's hog, for I
send carloads of them
to the packer every
year—uniform in
size, high in quality,
quickly and economi-
cally matured and
finished.
Young stock, \$30 Up.

dices which are no longer sound, as with but few exceptions California hogs are not fed on tule roots, acorns, etc., as they were a few years ago.

Constructive Needs.—The pork department of his concern has never been uniformly profitable, Mr. Washburn said, and he believes the same situation exists with other coast packers. But he has always considered this branch would react to constructive up-building and the first results of this are just apparent. He believes that this can be carried further by more direct contact of producer and packer and stated that he was willing to work along any legitimate line that can be suggested for the ultimate benefit of the industry.

The Future.—As long as the present export demand continues, Mr. Washburn said, we may expect high prices, but he believes producers will realize more money for their work when feed prices again become normal, even though the hog market be relatively lower.

Summarizing Handicaps.—In spite of the fact that coast packers are paying, on the average, as good prices as they are in the East, Mr. Washburn summarized the following disadvantages which must be overcome: Excessive condemnations, lower yields, poor demand for fresh pork cuts and sausages, prejudices against California cured meats and lard, excessive percentage of light, unfinished hogs marketed.

Buy for Money.—On the subject of "Marketing" (again from the packer's viewpoint) Frank M. Hauser of Los Angeles impressed the audience with the fact that there is a good deal of difference in different loads of hogs. Packers, he said, bought hogs to make money out of them and they paid most for those hogs that cut to the best advantage. They might want one type of hog today and another type tomorrow. Generally his firm likes to see the hogs before buying. Hogs had been brought to their packing house, he said, which they did not want at any price.

Poor Hogs.—As an example of what the packers do not want Mr. Hauser referred to the acorn hog, which shrinks badly and whose meat is flabby; also to the alfalfa-fed hog, having had no grain, which is nearly as bad. In regard to size Mr. Hauser stated that too many hog raisers market their hogs too young, thinking that they are saving feed by such practice. His advice is to hold them till they are mature, as the increased gain in flesh will more than pay the extra cost of feed.

SIERRA COUNTY, CAL.

Stockyards.—Col. Harris Weinstock in his address advocated a co-operative marketing association, along the lines outlined in his annual report as reported, in these columns in the issue of January 13. He thought that a stockyards under the control of the State Market Bureau at some central point in the State, such as Sacramento, would be effective in remedying present marketing troubles.

On the same subject D. O. Lively stated that there is more criticism against union stockyards than for them. Theoretically they should do good, as when a packer buys in the country he expects to get hogs cheap enough to pay the expense of the buyer. But where there are stockyards, neighborhood shipments can be made and the man with the small bunch can get as much for his hogs as if he had a carload. He said that when the question of stockyards was taken up with the railroads in San Francisco they opposed them on the grounds that if they assisted the stockyard idea it would necessitate their assisting other interests. Packers there are also divided as to the advisability of stockyards.

Squeals Wasted.—Producers, stated Wm. Bernstein of Hanford, have a just kick against California packers on the count that they do not utilize all of the hog in slaughtering as they do in the East. He classed himself among the advocates of purebred hogs, believing that it is the poor hog that brings prices down. After a man gets purebreds he not only raises better hogs but feeds and cares for them better.

Mr. Bernstein said that one pound a day gain on a hog is not what we should strive for; a gain of two pounds is small enough.

Joe Biddle, also of Hanford, thought that Indian corn should be more generally used as a hog feed in the State. He also advised precaution against disease, as government inspectors take nobody's word.

To Adjust Buying.—At the suggestion of J. L. Thatcher of Riverside a resolution was passed asking the president to appoint a committee of three growers and a like committee of packers to work out a plan whereby hogs will be graded and paid for according to grade. President Cunningham appointed J. L. Thatcher, R. P. Peters and Wm. Bernstein as the growers' committee, and Frank M. Hauser, J. C. Good, R. Scott and F. L. Washburn as a packers' committee. It was agreed among the packers that they would try to figure out a percentage basis and buy hogs on the percentage of yield. This percentage will be decided upon later.

Livestock Shows.—Annual livestock shows at Los Angeles and San Francisco were endorsed in a resolution presented by J. W. Jennings of Tehachapi, to fit in with the Portland and Denver livestock shows.

The first day's meeting was followed by a theatre party and the second was given over to a sight-seeing trip of Los Angeles packing houses. At the Cudahy plant the visitors were shown the "killing" room and a cutting demonstration was given at Wilson and Company's plant, after which the Hauser Packing Company's plant was inspected and a sumptuous luncheon served, which completed the program.

Paicines Ranch Co.

San Francisco,

Offers for sale fifty (50) head of eighteen months and two-year-old registered Shorthorn bulls; also a select lot of weanling registered bulls, sired by such bulls as Fond Lavender, College Count 3rd, Besie's Council and Whitehall of Orange. For prices and particulars apply to

Carruthers Farms First Annual Sale of SHORTHORN CATTLE

will be held at the farms near

MAYFIELD, May 2nd, 1917

The Bulls:

20 Bull calves of rare Scotch breeding will be sold in the sale, two of them sired by Count Avon, the sire of our herd bull, Count Glory; there will also be six sons of Mayflower Sultan—everyone a good one; the balance are young bulls from sires of a national name.

The Females:

35 head will be sold, among them some of the greatest cows of the breed, rich in Crookshank blood; some of the tops will be in calf to Count Glory, California State Fair Grand Champion 1916; there will be two heifers sired by Count Avon, the sire of Count Glory; several heifers sired by Mayflower Sultan; eight cows in calf to Count Glory—all of them being of the rarest breeding. In this sale will be sold more Crookshank cattle than has ever been sold in a sale in the West. Make arrangements to attend the sale, and look over this great lot of Shorthorn cattle.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING AND DAIRYMEN.

A. Wharton of Tulare received a carload of registered Holsteins from New York last week.

M. M. Holdridge of Stanislaus county has recently sold a registered Holstein bull to Theo. Heurlin of Escalon.

The monthly reports of eight creameries operating in Kings county show that there were \$2,000,500 paid to dairies in that county during 1916 for butterfat.

A report from Stanislaus county states that a shipment of three Dutch Belted cows has just been made from the Strader herd to parties in New York.

Over 100 head of purebred Holsteins have just been imported by Geo. A. Smith of Corcoran from Liverpool, New York, according to a dispatch from that place.

The registered Jersey two-year-old Interested Jap's Santa, owned by the Univ. of Cal., has recently completed a year's test with 9,052.5 pounds milk and 588 pounds fat.

The Jersey Farm Dairy at Fresno is remodeling its city distributing plant. A new system of pasteurization will be installed as well as the interior of the building remodeled.

The 59 grade cows and three registered Holstein bulls sold at auction by the Gottshall Land and Cattle Co. at Ripon recently averaged \$111.29. The top price for cows was \$175.

Deputies of the State Veterinarian who have been testing the dairy herds in the San Jose district report that 20 per cent of all animals tested have been found to be reactors. A total of 975 were tested.

The Orland Cheese and Butter Co. report an increase in their business during December, 1916, of 50 per cent over that of the same month in 1915. During December, 1916, they purchased 48,005 pounds of fat.

Meetings of dairymen at Chico, Gridley and Nord will be held during February by the campaign committee of the Northern California Milk Producers' Ass'n. The work of soliciting memberships will start at an early date.

The high record in the Stanislaus County Cow Testing Ass'n for the past month was made by the registered Holstein cow Abbie, owned by H. E. Cornwell. She produced 2635 pounds of milk containing 100.01 pounds of fat.

Meetings will be held at the following places in Yolo county by organizers of the Northern California Milk Producers' Ass'n: Yolo, Jan. 26; Woodland, Jan. 27; Clarksburg, Jan. 30; Esparto, Feb. 3 and Willow Oak Park Feb. 8.

At the annual meeting of the stockholders of the Exeter Creamery association the report was given out that the creamery now has 175 patrons and 107 stockholders, also that 200 per cent more cream had been handled in 1916 than in 1915.

An agreement has been entered into by the Danish Creamery at Fresno, the Riverdale Co-operative Creamery at Riverdale, and the Dairyman's Co-operative Creamery at Tulare whereby all of the business transacted by those firms in Los Angeles will be under the firm name of Challenge Cream and Butter Ass'n.

A letter has been received from R. M. Hobbs, director of the Cream Pooling Ass'n of Madera county, in which he says that the tardiness of the creamery who was the successful bidder for the association's cream caused a delay of 15 days in the commencing of operations. He says that because the Chowchilla creamery did not put in the highest bid, many dairymen from that district have dropped out. As the successful bidder has put up a bond of

\$5,000 and as there are many new dairymen joining the association, he does not believe there is much danger of the association disbanding.

Ernest Otto McClure, writing from Santa Ana, where he recently moved to from Modesto, reports the following sales of registered Holstein bulls: a son of King Pontiac Netherland Segis to H. Beatty, Santa Ana, also his dam Hartog Spofford to the same party; a bull calf to the Tuolumne Lumber Co., Modesto; one to Mrs. K. McClure, Modesto; one to Mrs. A. A. Wallis and one to Mrs. Geo. Maze; also three to Mr. S. Youngall of Modesto.

At the annual meeting of the Ferndale Cow Testing Ass'n held at Ferndale it was reported that there are 700 cows on the waiting list and that farmers at Arcata with 500 cows are anxious to join the Ferndale association. It is probable that three testers will be employed the coming year. J. W. Coppini offered a registered Jersey bull calf to the highest testing herd entered in the Cal. Cow Testing Competition that was also a member of the Ferndale association.

SWINE AND SWINEMEN.

The members of the Kings County Poland China Breeders' Ass'n have decided to hold their next consignment sale of Poland Chinas at Hanford, March 7.

C. M. Slocum of Glenn county has left for the Middle Western States where he will purchase about 80 head of registered Duroc hogs for California breeders.

Blackleg and hog cholera have both made an appearance in Kings county during the past month according to the monthly report of county livestock inspector Dr. Frank Griffith.

J. W. Sefton, who is reported to have the largest herd of Tamworth hogs in the State at his San Diego county farm, contemplates increasing the size of his present herd on his ranch in Imperial county.

Arlington M. Smith, president of the Tulare County Swine Raisers' Ass'n and prominent Berkshire breeder, has issued an open letter to all swine growers in that district urging them to co-operate in the restriction of hog cholera, some evidence of which has been found in the county.

The Berkshire dispersal sale held by Geo. P. York and Son at Modesto recently was well attended and the average received for the offering was satisfactory. Arlington Smith of Visalia was a buyer of three good ones. George Kounias of Modesto purchased the son of Grand Leader 2nd which was offered. The top price for sows was \$77.50 and the average for gilts and young boars was \$23.

BEEF CATTLE.

Los Angeles buyers have been purchasers of beef cattle in the Fallon district of Nevada recently. One shipment of five carloads is reported.

Announcement is made that the government has issued an order permitting the pasturing of 550 additional cattle in the Santa Barbara National Forest.

Inyo county reports the shipment last year of 3000 cattle to market, and consumed 1500 at home. Thirty thousand lambs were shipped and \$50,000 worth of wool was sold.

The Federal Bureau of Animal Industry has obtained an experimental ranch of its own on which to carry on range investigations. This ranch was set apart from the public domain in Idaho, and is to be occupied next summer.

The Farm Bureau of San Joaquin county have approved a county ordi-

nance which demands the placing of a stamp on all meat, showing the name of the butcher. The ordinance would also require an inspection of all slaughter houses every three months.

At the annual meeting of the American Shorthorn Breeders' Ass'n the appropriation for prize money at the Pacific International Livestock Show, to be held December 19-24, 1917, at Portland, was set at \$3750, an increase over last year's appropriation of \$1250.

An association to be known as the Tehama County Livestock Association has been organized at Red Bluff. Among other things which the new association will investigate is the cost of production of livestock under range conditions in order that the recent increase in grazing fees by the government may be more intelligently opposed.

Promoters of the livestock packing house at Fresno are complaining that they do not meet with co-operation from livestock raisers of the valley. They ask that a site for the plant be donated by the business and farming interests of Fresno and vicinity, but say that stockmen are not doing their share of contributing toward the financing of the project.

An agreement was entered into by the large packers at the annual meeting of the National Livestock Association held at Cheyenne, Wyoming, last week whereby all opposition to a government investigation of meat marketing methods is to be withdrawn. This is a result of the campaign for federal investigation fathered by that association during the past year.

SHEEP.

A report from Wheatland states that practically all of the spring clip in that district has been contracted for at 31 cents a pound.

The Ed Fraser flock of sheep near Wheatland has been sold to William Tharp of Marysville at a reported price of better than \$10 a head.

Sheepmen in the vicinity of Winnemucca, Nevada, are experimenting with cottonseed as a feed for their flocks during the present cold weather. Ewes are reported to be valued at \$14 a head there at this time.

The National Wool Growers' Ass'n at their recent convention at Salt Lake City indorsed the idea of seeking a standardization of wool and petitioned the Department of Agri-

culture to fix a definite standard by which wool should be sold on American markets.

MISCELLANEOUS.

The Fresno county committee of the Central Stockmen's Ass'n has launched a campaign for more members in that district, feeling that all stockmen are benefited by the work of the association and should lend moral and financial support.

D. O. Lively reports recent sales through his office of Poland China hogs to South American points; two Holstein bulls to Nicaragua; two jennets, thirteen polled Rambouillet sheep, one Shorthorn bull and a grade milk cow to Hawaii. Local transactions have embraced the sale of three cars of stock hogs to go on the rice fields and the sale of a number of bred gilts to a banker for boys who are engaging in the swine industry. An additional transaction was the sale of one hundred and six head of Shorthorn cows to W. J. Hammon of Chico.

The Imperial Valley is rapidly growing in importance as a cattle country. It is becoming the recognized feeding ground for cattle from Arizona, New Mexico and old Mexico. It is said about 2,000 cattle per month are being driven into the Valley to be fattened for market, and they find a ready sale when fat to Los Angeles packers. Cattle are said to fatten rapidly on the alfalfa and grain grown in the Valley. The dairy business in the Valley is also a growing one. About 8,000,000 pounds of butter is produced annually in Imperial county. Of the 115,000 cattle in the Valley, it is estimated that 32,000 are milk cows. Butterfat was sold to the extent of \$150,000. Hogs were sold to the extent of \$125,000 and its honey crop reached 15,000 cases.

BERKSHIRE SALE AT DAVIS.

The catalog for the Western American Berkshire Congress sale which is to be held at Davis Feb. 15 has just been received, as well as a program of the meetings which are to be held Feb. 13 and 14.

There are 38 animals consigned all of which are to be bred sows of the most popular breeding and from the leasing herds of California and the Northwest. Among those who will be present from the East will be A. J. Lovejoy, one of the foremost authorities on Berkshires in particular and hog management in general.

Kill Squirrels Gophers

Your local dealer carries Kilmol and U. S. Gov't Poisoned Barley

Herbert F. Dugan
1170 Sutter St. San Francisco

RATION FOR A JERSEY HEIFER.

To the Editor: I have a grade Jersey heifer fresh two weeks ago, and now giving about two gallons of milk daily. She has all the alfalfa hay that she will clean up quickly twice a day, and I wish to know if you will kindly tell me of an economical, balanced ration to feed her in addition, using beet pulp with molasses, copra bran, or any combination that is easily procurable in Los Angeles.—A. B. H., Covina.

At present prices mix up a ration of three parts beet pulp to one part rolled barley, or one part coconut meal. Mix the feeds dry first and then moisten with water so that after standing a few hours the mixture is moist but not sloppy. As your cow is a Jersey, and probably producing a high-testing milk, also a heifer, one pound of this ration to each four pounds of milk produced should be about right. If you have any volunteer grass or other green feed let her have access to that also.—Eds.

Word comes from Hollister that steps are being taken for the holding of a county fair there this year.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

MAKE BIG MONEY with our Big-type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months. 300 head, both sexes, all ages, reasonable prices. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare county, but address owner, R. H. Whitten, 610-A Security Building, Los Angeles.

GRAND CHAMPION SUPERBA POLANDS—A few choice spring Superba polands ready for service. Sows bred to Superba for fall litters. Prices reasonably low. Rough's Greenfields, Arlington Station, Riverside, Cal.

REGISTERED POLAND-CHINA BOARS of serviceable age. A Wonder and Chief Picture breeding. Every animal guaranteed. Price \$25. Bar N. Ranch, E. A. Noyes & Son, Props., Sutter, Cal.

HORSES AND MULES.

REGISTERED SHIRES—Black Hawk Stock Farm. Importers and Breeders, Easton & Ward, Proprietors, Burlingame, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT Co., Eugene B. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreets, or San Francisco banks. Office, 319 Underwood Building, 525 Market St., San Francisco.

LIVE STOCK INSURANCE—Registered live stock and farm work horses should be insured. The Hartford Company, strongest in the world, writing live stock. No trouble to answer questions. D. O. Lively, special representative, 215 Hobart Bldg., San Francisco.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

Farmers Should Breed Draft Horses.

[By Waynes Dinsmore, Secretary Percheron Society of America.]

The danger of overproduction of horses is remote. It costs more to produce them than any other class of livestock. For that reason many farmers sit back and proclaim that it doesn't pay to raise horses; that there never was a time when the horse market was so dull as now; that the motor truck and tractor have killed the horse business and the horse is a thing of the past. Some people believe all of this, even though the truth of the matter is the opposite. Those who have allowed such thoughts to direct their operations for the past five to ten years, will soon see the error of their ways. It takes time to make much headway in the horse business. Five years are needed to grow a horse. At best one should not expect more than two colts from three mares as an average per year. Moreover, not more than 16 per cent of our farmers are raising colts. Not long hence the American farmer will wake up only to learn that a great opportunity has passed. The next ten years is bound to see the greatest demand for horseflesh the world has ever known. It can't be met on short notice.

The man who is breeding every mare old enough to the best stallion available and is taking proper care of the offspring is the man who is sure to be rewarded. There are plenty of men who have bought and paid for farms within the past ten years by their purebred draft mares. In the same community there are farmers who are no better off financially than they were a decade ago because they failed to foresee the profits from using the right kind of horses in their farm work. The men who have made money and who are going to reap the fruits of their efforts in the future are those who early saw the undeniable need for heavy draft horses for farm work; who bred that kind and who will continue to do so without a halt.

Why is there a general tendency among farmers to buy their horses rather than to raise them? Farmers say, "I don't want to be bothered with a colt. When I get ready to plant corn or cut wheat I want horses ready to work; I don't want to have to pay \$25.00 for a little scrub colt and then have all the bother to raise it, besides." Men with such ideas have to buy a horse or two nearly every spring at a cost of \$150.00 to \$250.00 a head. Instead of having a horse or two to buy, better have some to sell. There is no unusual training necessary. Any farmer can raise good horses if he will only use common sense. He can even succeed with purebred drafters if he will select good parent stock, take reasonably good care of them and develop the offspring rightly. Therein lies the secret of success.

Million Head Exported.—Careful consideration of the situation cannot fail to convince us that there is no danger of an over-production of heavy-draft horses for our farm and city uses. Almost a million horses and mules have been exported from this country in the last 27 months for use in war. These figures show almost one horse or mule taken for

every twenty-five left. Even after the war is over, exports will not cease, for thousands of horses will be needed to start European agriculture anew.

It follows, as a necessary consequence, that the demand for purebred draft horses for breeding purposes will continue to be good. Importations have been, to all practical purposes, cut off. We are producing only twelve or thirteen thousand purebred draft horses eligible to registry. This means, in substance, that we are producing only five or six thousand stallions fit for service per year, when we need at least seven or eight thousand. An excess of demand over supply always makes good prices.

The farmer who uses heavy draft mares does better farm work, and raises bigger crops, than he who relies on small horses. Furthermore, he has horses to sell each spring, at a profit.

SILO CAPACITY.

To the Editor: How much Indian corn tramped by two men will a round silo hold if it is 12 feet in diameter and 24 feet high? What bulletin treats of silos?—E. J. F., Visalia.

Ask the California College of Agriculture at Berkeley for Circular 138 on "Silos in California." It contains a table from which we figure that your silo holds 55 tons of well-matured, well-tramped silage is filled to the top.

Decide on the type that is best suited to your purpose and stick to it through thick and thin.

Don't Let Your Horse Waste Your Money

Use a

TRUE BLUE HERCULES SWEAT PAD

They prevent chafes, galls, and shoulder bruises.

A sound horse does more work than one having bruises.

They cost only a dollar, a pair, and may save many dollars just at a critical time when your horses should be in condition to work without interruption.

TRUE BLUE (Hercules)

Sweat Pads fit any collar, and are made of heavy strong drilling filled with a composite especially prepared for horse comfort—mainly deer-hair.

When a dealer offers you a Hercules Harness, Horse Collar or Saddle, he is offering you **THE BEST THERE IS.**

Sales Barn in Hanford near S. P. Depot.

The Cheapest and Best Horse Power Known to Mankind

THE ONLY POWER which guarantees a man from 12 to 20 years' service. The only power capable of anywhere from 500 to 5000 pounds displacement under ordinary road conditions, per horse power. The only power that reproduces itself while it serves you. Government reports show that it pays you from 3% to 5% interest on the feed it eats by fertilizing your farm.

WHY NOT RAISE HORSES AND MULES NOW?

There has never been the shortage throughout the country there is today. There is no possibility of replacing the exportation of horses and mules within the next ten years to come. Few, if any legitimate businesses, can possibly show the profits to be secured from the raising of horses and mules within the next ten years.

I have at my barn in Stockton the best lot of jacks I have ever imported from Missouri and Kentucky to California. Also, **PERCHERON STALLIONS**, up to 2300 pounds in weight. Also, the **Best Saddle Horses**, which can be procured throughout Missouri and Kentucky.

And now is the time to buy. One year from today sires of both horses and mules will advance 33 1/3 per cent, and they will continue to advance until they have practically doubled themselves in price. Also, money to be made raising jacks. Dill Brothers, of Clements, California, four years ago bought of me \$12,600 worth of jennets. This year, their first year's offspring of jack colts have reached a salable age of three years, for which I paid them \$10,000 cash, or \$2,000 per head. They will have for sale next year fourteen head of jack colts, worth easily \$20,000, and should equal this the following years to come, which shows a profit of over 150 per cent per year. Can you beat it?

Why not do likewise? Why not follow their lead? As the above only lists their jack colts, they still have their jennet colts for sale in addition to the above as additional profits. Call and see my stock at the Race Track, while in Stockton. Prices reasonable, and terms payments, if desired.

Talk it over with your neighbors, organize a little company among yourselves, and come in and buy.

H. B. THORNBERRY, FAIR GROUNDS, STOCKTON, CALIFORNIA

VETERINARY QUERIES.

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for \$1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

DEHORNING TROUBLES.

To the Editor: In dehorning cows, both yearlings and mature animals, I have used a meat saw, cutting close enough to the head to include a small ring of hair. I used cotton with pine tar to close the holes when hollow. Some of the horns heal up but continue to grow. Two of the older cows gave trouble for several months and finally a white pus, resembling the white of an egg, with bad odor, began to run from the horns. I treated one cow an entire year. What can I do for quicker relief?—L. Y., Grass Valley.

If the horn-forming structure in the skin at the base of the horn is removed the horn will not grow again. Never plug the opening but use pine tar the day following the operation as a dressing for the wound.

BULLS' SHEATHS SWOLLEN.

To the Editor: I have had three bulls become unable to serve a cow. The sheath is swollen and they are able to get the penis out only 3 or 4 inches. They do not seem distressed while urinating. Will serving aborting cows cause this? Is it gonorrhoea? I notice in last issue of Pacific Rural Press you advise vaccinating for infectious abortion. Where can I get a reliable vaccine for this and can I do the vaccinating myself? Should cows with calf be vaccinated?—B. A., Visalia.

Wash out the penis with a hot saturated solution boric acid four times a day. The trouble may be caused by aborting cows. There is no such disease as gonorrhoea in animals other than the human. Abortion vaccine does not cure abortion, but seems to aid cows in carrying calves to full time. The act of abortion is simply one of the symptoms of the disease. A reliable vaccine can be bought through the writer at a cost of \$1.00 per cow, though we do not recommend its use on cows after breeding.

HORSE RATION LACKS MINERAL.

To the Editor: Two of the horses in my pasture have been gnawing the boards of the fence. Several of

my neighbors have been likewise annoyed. Can you suggest a remedy? C. E. P., Fairfield.

To the Editor: What can I give my horses to make them stop eating the fence and manger? I have given them ground resin and coarse salt but these do not seem to appease, their appetites for wood.—F. W. M., Modesto.

There is a lack of some mineral substance in the ration they are getting. Put the following in their feed once a day: one teaspoonful of each of the following: powdered and dried iron sulphate, flowers sulphur, saltpeter salt and black antimony.

COW'S UDDER NEEDS VETERINARIAN.

To the Editor: I have a cow which, just before going dry, had a swelling on her bag which caused her to give clabbered and bloody milk. I milked her out each milking, but it did no good. When she came fresh she gave no milk from the affected quarter although the other quarters seemed normal. She is about to come fresh again and I notice the one quarter is about twice as large as the rest of the bag and seems inflamed. What can I do for her?—C. G., Amsterdam.

It will be advisable to consult your veterinarian and have him use a Mastitis vacterin on the case.

DOES NOT COME IN HEAT.

To the Editor: A young cow dropped a calf last May and has not come in heat since.—F. J. L., Los Molinos.

This is a case of retained corpus luteum. A qualified man can dislodge this by manipulation of the ovaries.

COW CAN NOT GET UP.

To the Editor: A cow got down and could not get up. For two days she ate heartily of hay and grain. She did not chew her cud at all, and now is growing weaker. If she is constipated, what would be good for her?—Mrs. L. G. W., Boonville.

Symptoms too meager for diagnosis.

MARE BITES POSTS.

To the Editor: Why does my mare suck wind and bite posts in the barn or corral or when I tie her to a post? Is in good condition; used only for driving on a buggy.—J. T. T., Yuba City.

This is called cribbing, and is a habit which once formed is practically incurable.

HAIR OFF AROUND EYES.

To the Editor: A disease of the eye among the cows seems contagious. It starts with the eye and takes off all the hair for about an inch around the eye.—B. B., Pacheco.

Use yellow oxide of mercury ointment in and around the eyes once a day.

DIED WITH SWELLED HEAD.

To the Editor: What caused my yearling to die this morning? It took sick yesterday with a terribly swollen head especially around one eye. Blood was almost ready to come from the eye.

Looks like the bite of a snake.

GARGET AGAIN.

To the Editor: I have a cow that gives garget milk. She is running on alfalfa pasture.—G. W. I., Merced.

Call your veterinary and have him vaccinate for this.

Remco

SILOS TANKS

For dairymen, farmers, feeders in all sizes and proportions.

For water, wine, oil, vinegar, acids, for storage, mixing, fermenting, pickling.

PIPE

For irrigation, power, water supply, in all diameters and for all pressures. Costs less than any other pipe of equal efficiency and endurance. Outlasts any pipe except cast iron.

"Good to the Last Drop"

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or

Latest improved machinery. Doors, Windows, Frames, Mouldings. **R. F. WILSON, STOCKTON, CAL.**

Raising Poultry for Profit

RUNNING THE INCUBATOR.

[Written for Pacific Rural Press by Susan Swainsgood, Pomona.]

In our last paper on incubating we ran to the seventh day; but made no mention of testing the eggs out, because this is one place where it pays to go slow. Unless a person is well acquainted with the appearance of the embryo at certain stages it is safer to wait until the seventh day, at which time the egg will have a darkened appearance that almost anyone will know is an embryo, or chick in the making. Should there be a bad odor, such as would come from a rotten egg, take time to find it, because one bad egg will start others by contact; besides, bad air in the chamber is not good for the other eggs.

About this time the eggs can be aired a little at each turning, but never long enough to get chilled. When they have incubated, say two weeks, you can allow them quite a little air; the time, however, can only be judged by the atmosphere in the cool room. If the room is very cold it is just as well to throw a light cover over the eggs, as that will retain the heat and allow more cooling. Someone may ask, Why do this if it is cool—why not keep the eggs in the incubator and make sure they will not get chilled?

The answer is that chicks hatched from eggs that have not been sufficiently aired are never so strong and livable as those that have. Good airing makes strong chicks that do not require so much heat in the brooding. They are less like hot-house plants than those that are taken out of the incubator, turned,

and then put back at once.

After the eggs are tested you will have more room to turn the rest of the eggs; so you can just roll them around a little, giving the embryo exercise. Years ago we used to mark all eggs and turn them religiously, first to one side and then the other, as if the universe depended on that act. It was waste time. The only object in turning eggs is to keep the inner skin from becoming attached to the shell, in which case the chick would not be able to work its way out. A gentle rolling is much better than merely turning from side to side.

If you operate a hot-air machine keep moisture on the ground or even in a bucket inside the room; but unless the weather is hot very little moisture inside the machine is needed; and with a hot-water machine, unless the maker says so, put no water in machine, but keep the floor moistened the last few days before the hatch.

After the 18th day keep the doors of the machine closed until the hatch is off; then open up all doors and give the chicks fresh air while the shells are removed. In doing this be careful not to chill them. You will know if the temperature is right by the chicks—if they are too warm they will gasp for breath, if too cold they will bunch up in groups, and if they are comfortable they will spread out evenly over the nursery floor and wonder when you are going to feed them. It may seem that chicks will never get chilled in the incubator, but they often get a diarrhoea from being cooled off too much by opening the doors too often and turning the lamp down too low.

Forty-eight hours is soon enough to feed. I nearly always make my own bread for the first few days, but a little steel-cut or rolled oats mixed with fine ground Eastern oyster shell does very well. Given alone, rolled oats gets pasty in the chick's craw, but mixed with this fine oyster shell, which all chicks love to peck at, rolled oats in moderation are safe and good feed. Add a little cracked wheat the second day. In a few days they will be ready for a regular chick feed, either commercial or home-made.

After chicks are one week old give them a mash of wheat bran two quarts, brown middlings one quart, cornmeal two quarts, fine ground oyster shell one pint, fine bone-meal half a pint, beef scrap one pint, and ground oats or barley two quarts, one pint fine charcoal and quarter pound of salt. Give this about 10 o'clock in the morning and leave until near feeding time at night. After a month old leave mash before them all the time. See that the mash is mixed thoroughly, and if no ground barley or oats can be had make quantity up with shorts, bran or brown midds. Keep sand and fine grit before the chicks at all times and give green feed ad libitum.

QUESTIONS ANSWERED.

Lice on Hens.—Does the liquid of boiled tobacco, when sprayed on

Best and Cheapest Service in the World

Here are some comparisons of telephone conditions in Europe and the United States just before the war.

Here we have:

Continuous service in practically all exchanges, so that the telephone is available day and night.

A telephone to one person in ten.

3,000,000 miles of interurban or long-distance wires.

Prompt connections, the speed of answer in principal cities averaging about 3½ seconds.

Lines provided to give immediate toll and long-distance service.

In Europe:

Nine-tenths of the exchanges are closed at night, and in many cases, at mealtime.

Not one person in a hundred has a telephone.

Not one-eighth as many miles in proportion to population and territory.

In the principal cities, it takes more than twice as long for the operator to answer.

No such provision made. Telephone users are expected to await their turn.

As to cost, long-distance service such as we have here was not to be had in Europe, even before the war, at any price. And exchange service in Europe, despite its inferior quality, cost more in actual money than here.

Bell Service is the criterion for all the world, and the Bell organization is the most economical as well as the most efficient servant of the people.

THOROUGHBREDS WHITE ORPINGTON Hens—One Runner Drake. Prices reasonable. J. M. Steever, Cool, Cal.

chickens while on the roost, rid them of lice and mites? Or, what is the best thing to spray them with?—C. F. C., Fresno.

There is not anything so safe or sure for lice on hens or baby chicks as dusting them, either with commercial insect powder or with home made, the recipe for which find below. After you have dusted wait one week, then dust again, and you will get all the nits.

Recipe for making dust or insect powder: Four and a half pounds of plaster paris, one quart gasoline, half pint Kresol (at drugstore), one pound flaxseed meal, half ounce carbolic acid. Mix this in the gasoline and Kresol, then pour over the plaster paris and mix well with a big spoon. Set out to dry in the sunshine and when dry mix in the flaxseed meal and mix all well together. Put away in tight cans or it will lose strength. If you have but a few chickens, better buy a can of insect powder at feed store, as it is less trouble and expense.

Crop-Bound Hens.—I have some hens that are crop-bound. What is the best thing to do? I have fed some rice with the husk on, mixed with other grain. Would that cause the trouble? I gave them some castor oil.

Yes, rice with the husk on would cause the trouble if they ate much. Such foods as rice swell abnormally when they reach the moist, warm crop of a hen, and the husk, being tough, would not move around. The oil was all right; but what you should have done was to manipulate the crop of each hen well with your fingers after giving the oil, then make them fast two or three days. If you allow them to pick and eat at all they will not get well. Castor oil, or even small doses of coal oil, will help. The great thing, however, is to make them fast and exercise.

Chickens Have Roup.—I have

BABY CHICKS (White Leghorns)—shipped on approval before remitting. No weak ones charged for. Schellville Hatchery, R. F. D., Sonoma, Cal.

MAMMOTH BRONZE TURKEYS and Eggs. Booking egg orders now for early Spring delivery. M. M. Aelman, Planada, Cal.

some trouble with my chickens and can't find out what it is. They are in fine condition, lay well, and look well, but two or three had canker sore in the mouth. They got well, then one got a sore eye. When I opened it one morning a nasty yellow stuff came out. I washed their eyes with salt water, gave salts, and later on used peroxide. Now several are sick—one blind. They have plenty of grit, bones, charcoal, wheat, etc., and a warm place to sleep.

These hens had colds at first, and if you had caught them and treated them right you would have had no further trouble. Give all the flock a dose of coal oil. Pour the oil in the drinking water. This will clear their heads. Those that have any symptoms of genuine roup should be caught and put in a separate pen, dip their heads in coal oil, wiping off the extra oil, and give a bromoquinine pill every day for three days. If that does not start a cure, wring their necks. But you must clean up and disinfect all feeding troughs, drinking vessels, and even the ground where the germs are hid.

Australian poultrymen are seeking markets on the Pacific Coast for their surplus eggs. The shipment consists of shelled eggs frozen and packed in five-gallon cans, of which 150 cases came in on the steamer Ventura consigned to John Layton Company.

The Van Nuys district of Los Angeles county has developed into a great poultry community. It is said there are now 100,000 hens in the district and it is estimated that they produce for their owners about \$1.50 per head per annum.

Mrs. Best's Letter.

My dear Friends: There are so many electrical appliances on the market now to make the work of the busy housewife lighter, and when so many of you have the electric current in your houses, these appliances are just as possible to have in the country as in town.

Perhaps the most desired article with many of us is the vacuum cleaner. This is no harder to run than a carpet sweeper, but when used regularly, it keeps the dust out of rugs, draperies and cushions and keeps down the dust in the household. There are appliances that may be purchased to use on garments, mattresses and in fact anything that harbors dust. These machines vary in price according to size and power, but any of them are a long step forward from the broom and dustpan.

The electric fireless cooker has been a wonderful success and the proud possessor of one is envied by all her friends and neighbors. With these, there need be no previous heating of the article to be cooked, and roasts can be browned and bread baked as in a regular oven. For the cooking of dried fruits, cereals, rice and the like that are in danger of becoming mushy, the cooker far excels the kitchen stove. If the cooker were used at no time except when away from home for some hours, it would be a good investment. To come home from a long, tiring day in town, to find a hot dinner waiting to be dished, is a situation that would appeal to all of us, I am sure. For beans, brown bread and even plum pudding, that require hours of cooking, many women use the cooker entirely. There is a new one on the market designed to fit into the corner of an automobile for camping and picnicking. The utensils are better in the newer makes—being much less likely to rust.

The electric iron I hope you all have, for it is just a moment's work to get it ready for use and it is needed so many times in the course of a week.

The electric toaster is nice to own if you have a family that comes trailing along one at a time for breakfast, and the percolator is an addition to any household.

If you have straight hair and like to curl it a bit when going out, you would enjoy the electric curling iron that you can use in your own room.

The electric warming pad, I am sure I would be glad to own these freezing nights and it can be regulated to a low heat, so that it can run all night at a small expense and be a toasty bed fellow.

Yours devotedly,
Rosabella Best.

CARE OF THE HAIR.

If the hair becomes very dry and brittle, a little vaseline rubbed into the roots will be found helpful. This is not so satisfactory for use on blonde hair as it has a tendency to darken it.

For the shampoo, any good white soap is good, but if the water is hard it may require a little borax to soften it. If the hair is blonde in color and it is desired to keep it light, try giving it a lemon rinse

THE HOME CIRCLE

after the soap has been carefully rinsed out. This is prepared by squeezing the juice of two lemons into a pint of water and is the last rinsing.

NEW WAYS TO PUT UP FRUITS AND VEGETABLES.

Every woman who ever puts up fruits or cans vegetables ought to read the circular on "Home and Farm Canning" written by W. V. Cruess, Assistant Professor of Zymology in the University of California, just published, and to be had for the asking by writing to the College of Agriculture at Berkeley.

Professor Cruess says the problem has now been solved of canning vegetables without the repeated heatings which have been necessary in the past, which were troublesome and expensive and injurious to flavor and texture. The new method is merely the addition of a little acid to the liquid in which the vegetables are canned. He has proved, for example, that peas keep perfectly after being heated to 212 degrees F. in a brine containing five ounces of lemon juice to every gallon, while peas heated in the same brine without lemon juice spoil. The same results have been obtained with beans, pumpkins, beets, turnips, artichokes, and asparagus.

When canned fruits or vegetables spoil, says Professor Cruess, it is because of the growth of one of three different groups of microscopic vegetable organisms—such as the blue-green molds of spoiled fruits, the yeasts familiar in bread-making, and the bacteria found in the scum and "mother" of vinegar. None of these organisms ever arise from non-living matter, so if all the germs can be killed by heat and the air be kept out, neither mold, yeast, nor bacteria will cause spoiling.

The molds and yeasts are quickly killed at temperatures below the boiling point of water, but the bacteria on vegetables are astonishingly resistant to heat. Often they can stand the temperature of boiling water for an hour or more—but with the use of lemon juice this problem is solved.

The flavor and texture of fresh fruits can be much better retained if they are canned at low temperatures, and Professor Cruess has succeeded in safely sterilizing peaches, apricots, pears, cherries, and berries at temperatures of from 165 degrees F. to 175 degrees F., by filling the cans with fruit and a fairly heavy syrup and keeping the cans in hot water, kept at 175 degrees F., for ten to twenty minutes, with occa-

sional stirring to hasten the penetration of the heat.

The housewife's success with her canning and preserving will be much aided if she will use a good thermometer, costing a dollar, and a "saccharometer," or sugar-tester, costing about 75 cents, which is useful in making the sugar syrups of the desired strength.

The widespread notion that beet sugar is not as good as cane sugar for putting up fruit is declared to be now without foundation, since cane sugar and beet sugar are exactly the same thing chemically.

HOME GROUND WHEAT.

A very inexpensive breakfast food can be prepared at home by grinding wheat. An ordinary coffee grinder will answer and the wheat must be free from dirt or other seeds and have been washed and thoroughly dried.

One strong point in its favor is that all the nourishment of the original wheat is there and it is much more laxative than many of the breakfast foods on the market.

Home ground breakfast food, like all coarse cereals, requires long cooking. It should be cooked at least three hours and over night is still better. For this purpose, a fireless cooker would be ideal.

Care should be taken in salting home-ground wheat. A level teaspoon of salt to each cup of water is about right and to each quart of salted water use one cup of wheat. If hot water is used, the cereal should be stirred until it has thickened a little. The food value of this dish can be greatly increased by the use of milk instead of water.

Breads can be satisfactorily made from home-ground meal and tested recipes will be sent on application to this office.

COOKING WHOLE DRIED APRICOTS.

Editor Home Circle: Will some reader of the Press give me a tried recipe for cooking apricots dried whole?—Mrs. D. L. T., Ventura.

Wash carefully, putting only one at a time into the water on account of scuffing the tender skin, cut out any bad parts, soak in cold water over night, simmer in the same water about an hour, when an ordinary spoon will cut the flesh without mashing it. Sweeten about 15 minutes before done. Remember that whole dried apricots are much sweeter usually, than those which were green and firm enough to cut and dry satisfactorily.—Mrs. R. E. H.

OLD AND NEW FRIENDS.

Make new friends, but keep the old; those are silver, these are gold. New-made friends, like new-made wine, age will mellow and refine. Friendships that have stood the test, time and change, are surely best. Brow may wrinkle, hair turn gray, friendship never owns decay; For 'mid old friends, kind and true, we once more our youth renew. But, alas! old friends must die; new friends' must their place supply. Then cherish friendship in your breast; new is good, but old is best. Make new friends, but keep the old; those are silver, these are gold.

—Henry van Dyke.

Floral Department.

[By Geo. N. Tyler.]

I have had the following query this week:

Please tell me what kind of fertilizer to use in the soil of my flower garden to make it lighter and help the plants to make a better growth. The soil is heavy and slightly alkali. We have dug in big wagon loads of barnyard manure during the last six years, but in a few months after it was mixed with the soil, the soil was heavy again. The plants do fairly well for this dry climate. We have soft river water to use in garden. I find a great many small white worms one-eighth inch long, very white and small. They work in cuttings of soft wood and in a few dahlia tubers I had, and in some pot plants. They kill anything they get at. Do you think lime in the soil would kill them?—Mrs. Wm. L. Bethany.

In reply to the above will state that I do not know from the query whether the soil is clay or adobe. Cow manure is good for sandy soils, and horse manure with plenty of straw will make the soil more friable, but I should judge that the soil is sour and full of humic acid, from the frequent applications of fertilizer, and the denitrifying microbes do not have a chance to work. If you can get some blue litmus paper, make a ball of some of the moist soil and if the paper turns red it is a sign that the soil is sour. You can get the litmus paper at any drugstore at the cost of five cents. If it turns red, give a heavy application of hydrated lime. To get the best results the lime should be spread on the surface and cultivated, raked or hoed in. It should be near the surface, as water takes it down. It will sweeten the soil, make what fertilizer is in the soil available for plant food; also put the soil in fine mechanical condition so the microbes can work, and it will make the soil more friable and easy to work. Regarding the small worms you describe, I should judge that they are insects feeding on the decomposing vegetable matter and do no harm to a healthy plant or cutting. Lime will have a tendency to reduce them, but unless I have a sample, I cannot state positively whether they do any harm or not.

CARE OF DRUGS.

Most families keep on hand a small supply of drugs for household use, especially rural households, distant from drugstores. It is well to bear in mind that many drugs are subject to deterioration—some from exposure to light, others to air or moisture. These drugs, therefore, should be excluded from the light and tightly corked to prevent the access of air and atmospheric moisture.

The Chinese Woolflower

Introduced by us three years ago, this is now a favorite garden plant. It is a native of China, where, plants growing 2 to 3 feet, a perennial plant, with many flowers, bearing green, bell-shaped, tubular flowers, with a yellow center. The flowers are very fragrant and none of the leaves freeze, even in the coldest weather. The plant is very hardy and can be grown in any soil. Seed 10 cts. per pk. 10 cts. 3 for 25 cts. Good Health.

(By H. E. Pastor, M. D.)

Parents' Interest and Responsibility Paramount.

This writer has been asked what
he thinks of the propriety of teach-
ing sex hygiene in the public schools.
It is a delicate question to ask, and
as difficult to answer as it is delicate;
and the writer approaches the sub-
ject about as willingly as a politician
canvassing for office faces the awk-
ward questions flung at him by a
Prohibition or a Woman's Suffrage
delegation. It is just now a live
question—very live—and the waters
on either side are deeply stirred.
Whichever side you espouse you get
little praise and much abuse. And
it's such a delicate subject! It's like
a hot potato—you feel like dropping
it every moment you are handling it.

Biologically considered, sex is the
greatest fact in human life, as it is
in all animal life, where natural im-
pulses are allowed unrestrained
sway; and it is the instinctive knowl-
edge of this fact which underlies the
wide-spread solicitude of society,
and especially society's parents, to
meet in the right way the emer-
gencies that inevitably arise when
sons and daughters arrive at the age
of sex consciousness. That the mys-
teries of nature's processes must at
some time and in some way be im-
parted to these sons and daughters,
who in due course must take our
place in society as parents, goes with-
out saying. The question is, then:
Shall this knowledge, this funda-
mental physiological fact of our be-
ing, come to the adolescent child in
the haphazard way that it frequent-
ly, or indeed commonly, is allowed
to come? Certainly not! This kind
of tuition is both inadequate and
perilous. Then how and when shall
it be communicated, and by whom?

It is urged by large numbers of
those interested that this instruction
should be made part of the public
school curriculum.

We dissent. The average school
teacher is not qualified to handle this
subject; and if he were, he is not the
proper person; nor is the public
school classroom the proper place.
The public school is the up-to-date
Tree of Knowledge, which bears
fruit of both good and evil, and
some of its impressionable disciples
taste the latter to their sorrow. In-
struction in sex hygiene is a ques-
tionable scion to graft upon this
great tree. A school full of children
is a motley crowd, of diverse heredi-
ties, temperaments and tendencies,
and the fruit that may benefit one
may poison another. To the pure
all things are pure; to the evil,
otherwise. "Where the bee sucks
honey, the spider sucks poison."

To express a humble and individ-
ual opinion, without beclouding or
befuddling the subject with too many
whys and wherefores, we prefer to
go on record as saying that the
parent—father or mother—after
counsel with the spiritual or medical
adviser of the family, is the proper
person to reveal this delicate but
necessary information. When a
child reaches a powder magazine on
the journey of life it is safest in the
leading of its parent—at least, so
thinks this scribe, though he has no
quarrel with those who view the

matter from a different angle. If it
be contended that some parents neg-
lect this important duty, the valid-
ity of the answer here given is not
affected. It merely brings up an-
other question—a sociological one.

Bacteriological Kinks.

An Argus-eyed correspondent of
the Rural Press protests good-na-
turedly against a statement made in
this column a few weeks back which
seemed to imply that the hookworm
is a stranger within California's
gates. He won't have it so, and says
the hookworm has a very intimate
acquaintance with the mining popu-
lation in the high Sierra districts.
Mr. Frank T. Swett, Horticultural

Commissioner of Contra Costa Co.,
the critic referred to, is right in his
contention; and we are glad to have
the fact brought out, for we believe
it is not generally known that this
unwelcome guest has a habitat with-
in the State's domain. Mr. Swett
says "our glorious climate can raise
anything," and warns this writer
"not to detract from our possibilities
or pestabilities."

Yes, the microbe of tetanus lurks
in many places other than the rusty
nail, but he's always at home there.

If you would keep your body
healthy, keep it clean; if you would
keep your mind healthy, keep it
clean.

SAN FRANCISCO.

San Francisco, Jan. 24, 1917.

WHEAT.

Continued peace agitation has limited buying for export, and difficulty of shipping by rail also has tended to weaken the Eastern market. Local values are firm and unchanged, with very little on hand here, and light offerings in the north.

Sonora wheat 2.80
Northern club 2.70@2.75
Calif. club, ctt. 2.60@2.65
Northern Bluestem None offered
Northern Red None offered

BARLEY.

Shipping grain available for export is cleaned up, and the limited stock of brewing barley left for local needs is not moving. Seed is quite firm at the last quotation, with some demand and feed is very firm at an advance, with light and diminishing supplies.

Seed, ctt. \$ 2.50
Shipping, ctt. 2.35@2.40
Brewing Nominal
Choice feed, ctt. 2.25@2.27½

OATS.

Values are firm, with offerings of moderate size and quite a strong demand for both red and white oats, which are stimulated by the jump in barley.

Red feed \$1.80@1.85
White 2.15@2.20

CORN.

Everything under this head is very firm, and it is rather hard to get Eastern yellow at the appearing prices. Milo and gyp corn are moving in large quantities, offerings are large and include much poor stuff, preventing further advance.

[First-hand prices on strictly first-class grain, San Francisco.]

Eastern Yellow, ctt., in bulk \$2.10@2.15
California, sacked 2.20@2.25
Milo Malze 2.00@2.20
Egyptian 2.20@2.25

BEANS.

Blackeye beans are as usual subject to sudden fluctuations of demand, and just now are neglected, though comparatively cheap, and price has been marked down slightly. The only other notable change is on limas. These were rather dull for a time, but there has been renewed Eastern inquiry, and Southern California holders are demanding an advance, which has been paid on some transactions. Pinks steady and are moving well; the demand for all other varieties is very good.

[Uncleaned, on wharf, San Francisco.]

Bayos, per ctt. 5.75@6.00
Blackeyes 4.25@4.50
Cranberry beans 6.60@6.75
Horse beans 3.25@3.50
Small Whites (south) 7.00@10.50
Large Whites 8.10@9.50
Pinks 6.90@7.10
Limas (south) 7.75@7.85
Red Kidney 9.00@10.00
Mexican Reds 6.50@7.00
Tepary beans 5.90@6.00

HAY.

Arrivals have dropped off a little, and appear to be sufficient, as many local buyers regard present prices as only temporary, and are holding off. The situation, however, is extremely firm, and conditions are in favor of continued high prices, with prospect of advance. The cold, dry weather of the last fortnight has necessitated feeding in the country on an even larger scale than before, and the movement from country warehouses has been extremely heavy since the first of the year, leaving much less than usual at this season. It looks, moreover, as if the large feeding demand would continue for some time; and continued drought causes some apprehension for new crop. Local dealers have been buying what they could in the country, taking heavy tonnage to cover early spring needs. Low-grade alfalfa, in great demand for feeding, is higher.

[Prices per ton, carload lots, San Francisco.]

Wheat, No. 1 \$17.00@19.30
No. 2 15.00@17.00
Tame oats 14.00@19.00
Wild oats 14.00@16.00
Alfalfa 14.00@17.00
Stock hay 13.00@14.00
Straw, per bale 7.00@9.00

FEEDSTUFFS.

Demand for everything has been exceptionally heavy for the last fortnight, and continues strong. Alfalfa meal is higher, and rolled barley has only been kept down by offerings of cheap lots adulterated with screenings.

[Per ton, San Francisco.]

Beet Pulp, per ton \$30.00@31.00
Alfalfa meal, per ton 21.50@22.50
Bran, per ton 30.00@31.00
Oil Cake 40.00@41.50
Coconut cake or meal 31.00@32.50
Cracked corn 47.00@48.00
Middlings 39.00@40.00
Rolled Barley 46.00@47.00
Tankage 47.00@48.30
Rolled oats 46.00@47.00
Rice middlings 33.00@34.00

POTATOES, ONIONS, ETC.

Fresh garden truck in general is scarce and mostly poor, owing to heavy damage done by the frosts. Celery shows an extreme range, owing to the presence of much trashy stock. Delta potatoes are held a little higher, but the local demand is less than half what it usually is, and while there is some Eastern inquiry, the movement is not heavy. Onions are in similar position, with few offered below \$5. Stocks of both are so light that no difficulty is expected in cleaning up, despite light demand.

Lettuce, crate 1.25@1.75
Celery, Delta, crate 2.90@4.50
Tomatoes, crate Nominal
Rhubarb, box 1.00@1.50
Potatoes, ctt., Delta 2.40@2.75

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

Salinas 2.75
Oregon 2.40@2.75
Onions 5.50@6.00
Garlic, lb. 3½@4c

POULTRY.

Turkeys still in demand, and dressed stock commands high prices. Arrivals of chickens, both local and Eastern, very light, California poultrymen sending as little, and market is frequently entirely cleaned up. Arrivals consist largely of hens, which are the weakest item on the list. Broilers firm, and young roosters have advanced. Ducks and geese are higher.

Turkeys, dressed, large, lb. 29@32c
Turkeys, live, lb. young, large. 25@26c
lb. 28c
Broilers, 18 lbs to doz and less. 29@31c

Demand has quieted down, and Y. A.'s are easier, though other grades stand as before.

Y. A.'s fancy 20c
Fancy Calif. Flats, per lb 18c
Monterey Cheese 17@19c

DECIDUOUS FRUITS.

Cold storage apples and pears are unchanged. California apples are moving only locally, but find a good demand, while northern stock is going

Special Livestock Market Report.

San Francisco, Jan. 24, 1917.

CATTLE continue to be scarce and while we have not changed our quotations, prices are firm as last quoted. Buyers have about given up trying to locate choice lots and are satisfying themselves with whatever is offered.

Steers, No. 1 8 @8½c
No. 2 7½@7¾c
Cows and Heifers 6½@7¾c
No. 2 6½@6¾c
Bulls and Stags 5½@6c
Calves, light 9 @9½c
Medium 8½@9c
Heavy 7 @8c

SHEEP and lambs continue to be in strong demand with no offers being made. Two shipments of Utah lambs are en route to this market and this is said to have about cleaned up the available supply there. The sheep that are being killed are being drawn from feed lots entirely. Values are hard to establish owing to lack of trade, but the market is strong at our figures.

Prime Wethers 8½@9½c
Ewes 7½@8c
Lambs 11@12c

HOG receipts again fell off some, but quality remains good as last reported. Quite a few acorn hogs are being offered, but it is difficult to find buyers. Receipts here continue to be solely from California points. Prices are unchanged.

[Rough, docked 20 pounds, piggy sows, 40 pounds, stags 80 pounds.]

100 to 150 lbs. 8½c
150 to 300 lbs. 9½@10c
300 to 375 lbs. 9½@9¾c

WOOL activity is reported from the upper Sacramento Valley and Nevada sections at soaring prices. Reports of 31, and as high as 33, cents are numerous from both sections while 26 to 28 cents are the highest offers we have heard of from the Bakersfield district, some sales being made at those figures. No activity is reported in Mendocino or Imperial districts. London sales are about over and a decline of 10 to 15 per cent is recorded. Only a small amount of wool has been released by England and this will have no effect on local values. Boston market has a stronger tone.

Sacramento Valley, spring clip. 22@30c
Mendocino, year's 32@33c
Southern, spring clip 26@28c
Southern, 7 months 13@16c
Imperial Valley, 7 mos. 14@15c
Nevada, year's 31@32c

HIDE MARKET continues slow. Reports from the East say, "Largest tanners haven't been in the market for six weeks." There are plenty of offerings locally but no takers. Sales at these prices should be warranted.

Steers 21 @23c
Cows 21½@23c
Light hides, 25 to 48 lbs. 21½@23c
Kip 23 @24c
Calf and veal 31 @32c
Dry Hides 32½@33½c
Dry Kip 35 @36c
Dry Veal and Calf 38 @40c
Pelts, long wool 1.75@1.90
Short wool85@1.10
Horse hides, wet, large, ea. 5.00@5.50
dry, large 3.00@3.50

Los Angeles, Jan. 23.

CATTLE: The continued high markets East and improvement in the beef market caused killers to bid up prices of good killing steers and fat cows 50c per cwt. and advanced cows and heifers the same. Stockers and feeders unchanged. Receipts only fair. California and Arizona furnished most of the supply and what coming in were placed without trouble.

Beef steers, 1000 to 1100 lbs. \$8.75@9.00
Prime cows and heifers 7.00@7.25
Good cows and heifers 6.50@7.00
Quotations f. o. b. Los Angeles.

Beef steers, 1000 to 1100 lbs. \$8.75@9.00
Stockers and feeders 5.50@6.00

Prime cows and heifers 7.00@7.25
Good cows and heifers 6.50@7.00

HOGS: A good and strong market continues. California furnished a very fair supply the past week of very good hogs and there were a few in from Arizona and Idaho. Most of the Idaho hogs, however, continue to go East, being drawn there by the high prices. Killers all in the market and wanted supplies and what hogs arriving were disposed of without trouble.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 250@300 lbs. 9.25@9.50
Mixed, 200@250 9.25@9.50
Light, 175 @200 9.25@9.50

Rough docked 20 pounds, piggy sows 40 pounds and stags 80 pounds.

SHEEP: In sympathy with high markets east and under the influence of a good demand there was a sharp and general advance. While there was a fair supply of sheep and lambs had from Utah and Idaho, the arrivals were not large and killers were free buyers and prices ruled \$1.00 per head higher all round. Killers were all in the market and wanted supplies and the offerings were disposed of without trouble, and more could have been sold if here.

Per head, f. o. b. Los Angeles:

Prime wethers \$8.00@8.25
Prime ewes 7.50@7.75
Yearlings 7.50@7.75
Lambs 7.00@7.50

CALVES: Not many coming in and market firm and demand good for what arriving. Selling at \$8.50@9.50 per cwt.

North Portland, Ore., Jan. 22.

CATTLE: The offering of cattle was very good here this morning and the market was in fairly good shape on everything offered. The demand from the large packers was limited, although there was a liberal outlet to various butchers. Prices on all good grades were steady, while other grades showed 10c lower, in a number of cases.

BEEF STEERS: The beef steer trade was active today and the market was in good shape. The feature of the trade was the sale of several loads of prime grain and hay feds at \$8.50; most of the fairly good beef steers crossed the scales from \$8.00 to 8.25; and fair kind at \$7.25 to 7.75; while the common kind sold from \$5.00 to 6.00.

COWS AND HEIFERS: Cows of good quality found very good demand at prices steady with a week ago; one lot brought an advance of 20c, bringing \$7.60; with a number of bunches at \$7.50; the fair to good kind brought \$6.75 to 7.00.

BULLS AND STAGS: There was a good run of Bolognas here today, although the bulk were received on contract. Best heavy bulls brought \$5.50 while good ones sold from \$5.00 to 5.25.

HOGS: There was a light supply of hogs here today, which met a very good demand and buyers had to share the offerings at sellers' prices. Prices were advanced 25 to 30c again this morning, sellers getting everything they asked for. Most of the good hogs crossed the scales at \$10.85, there being no strictly top hogs offered. Pigs were in light supply, the bulk getting \$9.35 and a few scattered sales at \$10.00.

SHEEP: Lambs continued their upward climb today. There was a fairly liberal supply in the pens, but the finished condition of the trade is especially on fat lambs shot values at 75c. Best bailey lambs climbed up to \$11.50. The market on old sheep is practically the same. Best yearlings are quoted at \$10.00 with medium at 9.55; best mutton ewes at \$8.00 to 8.50; heavy medium types from \$7.00 to 7.50.

East in large lots. Stocks here are only 65 to 70 per cent of the amount held last year at this time, and the outlook is favorable for firm prices.

Apples:
Bellflower, box \$.65 @ .75
Newtown 1.10 @ 1.25
Pears, Winter Nellis 2.25 @ 2.75

DRIED FRUITS.

The spot situation is no longer of much interest to growers, as the limited supplies left are nearly all in packers' hands. Prices are quite firm for anything left in the country, with further advances possible; though there is hardly enough business in most lines to justify definite quotations. Spot prunes have been a little quiet in the East since the holidays, but for the last week jobbers have been taking more interest, and it is known that stocks in the trade are quite low. Packers are holding firmly. Peaches are moving steadily. Figs closely cleaned up, and higher prices are offered for black, which are the only kind to be had in the country. Some of the larger fig packers are actively in the market for new-crop contracts, and are offering higher prices.

[Net to growers, bulk basis, f. o. b. shipping point.]

Apples, new crop 8 @ 8½c
Apricots, per lb. 1916 15 @ 16c
Figs, black, 1916 6½ @ 7c
do, 1917 6 @ 6½c
do white, 1917 6 @ 6½c
Callimyrna, 1917 10 @ 10½c
Prunes, 4-size basis, 1917 5c
Pears 7 @ 8c
Lake County Pears 11 @ 12½c
Peaches, 1917 6c

NUTS.

Most of the Manchurian walnuts to come this way have now arrived. The year's exports from that country were about 50,000 bags, about equally divided between this country and Australia. In view of the light supply of California nuts and the difference in quality, Manchurian nuts have offered little competition.

LOS ANGELES.

Los Angeles, Jan. 23, 1917.

BUTTER.

Receipts of week ending Jan. 23, 1917—319,387.
Receipts of week ending Jan. 23, 1916—237,900.

There was a sharp break in the market here the past week. There was quite an increase in the receipts and the Eastern markets have dropped until the outlet there for California butter has been closed. Extra in Chicago is now 36½c and in New York 39½@40c. In San Francisco the market advanced 2c up to Monday. But this had no influence upon the market here in the face of the increased receipts. Local consumption is now very good and promises to hold up well for the next two months. It is well to bear in mind, however, that extra is still 8½c higher than this time last year. Tuesday brought no change. Fresh extra was quoted at 37c. Chicago and New York were much the same as the day before.

We quote extra creamery 37c
Prime first 35c

EGGS.

Receipts (railroads) for week ending Jan. 23, 1917—1337 cases.
Receipts (railroads) for week ending Jan. 23, 1916—1031 cases.

The break in the market has come at last. It is a little late this year, but it arrived last week and values may be expected to settle from this on. Receipts were a little better the past week and the Eastern markets made a sensational drop, closing that outlet for Pacific coast eggs. In Chicago first declined up to Monday 8½c and New York 10c. In San Francisco the market for the same time broke 6½c. Under this influence the market here after advancing 4c early in the week broke 7c on pullets up to Monday, 8½c on extras and 7½c on ranch. But at this decline there was a very good street demand, but the shipping demand noted the week before was absent. Still even at this decline prices are 4c higher than this time last year. Tuesday there was another break in the market. Receipts were the heaviest for a long time and San Francisco was sharply lower, which with the heavy receipts made buyers very bearish. Fresh ranch case count sold off 2½c, extras 4c and pullets 4c and close weak.

We quote fresh ranch case count. 32½c
Extras 33c
Pullets 31c
Candied 2c and selected 3c over quotations.

Pullets	42	41	41	38	25	31

POULTRY.

Not much in the past week. No Eastern arrivals and the local receipts were light. This caused a firm market and there was a good demand for everything. Broilers, fryers and hens sold without trouble, while heavy turkeys were higher and in good demand at the advance.

Broilers, 1½ to 2 lbs. 25@26c
Fryers, 2½ to 3 lbs. 22@23c
Hens, over 4 lbs. 20@21c
Ducks 18@19c
Geese 16@17c
Roosters, 3 lbs. up (soft bones) 22c
Turkeys, heavy, 12 lbs. and up. 27@28c
Turkeys, light 23@24c

Squabs, live, per doz.\$1.50@3.00
Dressed 3.75@4.85

HAY.

There was a further dropping off in the receipts the past week and trading light. Prices, however, show no change. Only the better grades showed any life and buyers of them were inclined to confine themselves to such lots as needed for immediate consumption. But for the light arrival values would probably have worked lower as there is no disposition to buy ahead or stock up. There was an entire absence of speculation, and disposition to let the market take care of itself.

We quote f. o. b. Los Angeles:
Barley hay, ton\$18.00@20.00
Oat hay, ton 19.00@21.00
Alfalfa, northern, ton 16.00@17.00
Alfalfa, local, ton 18.00@20.00
Straw, ton 9.00@10.00

HONEY.

There was a little better movement the past week. While there was some improvement in the inquiry prices showed no change; holders seeming

satisfied with current values for the time being. Stocks light, however, and the situation favors holders.

We quote from growers:
Water white, pound 7 1/2 c
White sage, lb. 7 1/2 c
Light amber sage, lb. 7 c
Light amber alfalfa, lb. 6 1/2 c
Fancy white comb, lb. 10 c
Light amber comb 9 c
Beeswax 30 c

BEANS.

A steady and rather firm market was had the past week. The demand, however, was light. The home trade seems to have been supplied for the time being and there was very little shipping inquiry. Holders, however, were independent and old prices were being sustained.

We quote from growers:
Limas\$7.75@ 8.00
Large white10.90@10.50
Small white 10.00@10.50
Pinks 7.25@ 7.50
Blackeyes 5.25@ 5.75
Tepary 5.75@ 6.25

Special Citrus Market Report.

Los Angeles, Jan. 23.

Shipments of citrus fruit from Southern California from November 1 to January 21: Oranges 4,223 cars and lemons 1,065 cars. Same time last year: oranges 2,209 cars and lemons 1,165 cars.

Shipments from Central California from November 1 to January 19: oranges 3,890 cars and lemons 130 cars. Same time last year, oranges 4,109 cars and lemons 102 cars.

Shipments from Northern California from November 1 to January 19: Oranges 841 cars and lemons none. Same time last year: Oranges 594 cars and lemons none.

There was a better movement and stronger markets at the East the past week. The receipts were not heavy and the consumption was very good. This with severe weather, which means lighter arrivals for the moment, caused buyers to bid up a little stronger. Lemons as well as oranges showed more strength and were reported in better demand. Locally the market situation remains much the same as the week before. Bad weather most of the time and free offerings of culls caused local packers to hold back and do little. The fact that the markets East were stronger failed to influence the market here. Local pack-

ers were cautious buyers and confined themselves mostly to larger sizes and highly colored fruit, for which they bid 1c per pound in the grove picked. Small oranges were dull even at this price. Good northern grapefruit was in very good demand at 1@2c per pound in the grove picked. But little doing in Southern grapefruit. Tangerines dull at 1@2c per pound in the grove picked. Lemons were draggy and unchanged. Local packers bidding 1@1 1/4c per pound in the grove picked for best. Poor lots very dull and had to be sold for what they would bring.

AUCTION SALES.

New York, January 22.—Eighteen cars navels and two cars lemons sold. Fancy navels about 25c higher; ordinary and poor stock slightly higher. Lemons about 25c higher. Weather cloudy. California navels averaged \$1.40@3.35. Lemons averaged \$1.90@2.80.

Boston, January 22.—Twelve cars sold. Market doing better on both oranges and lemons. California navels averaged \$1.40@3.15. Lemons averaged \$3.90.

Philadelphia, January 22.—Market is higher. One car sold. California navels averaged \$2.00.

Interest in Future Wool.

The spring clip, though shearing is still some six or eight weeks off, is already commanding attention. Buyers from the local houses have been looking over the principal sheep districts the last few weeks, and while they have shown a rather offish attitude, it is evident that they are anxious to make contracts for anything that can be had at what they are willing to pay. The prices offered cannot be considered as low, but they are below the views of most growers, and there are many factors to encourage confidence in higher prices.

Considerable contracting is said to have been done in other quarters: about 70 per cent of the Nevada clip is reported under contract at 27 to 30c, and probably about 30 per cent of the whole United States clip. The only large business in California has been done around Bakersfield, at 24 to 27c. A little Red Bluff wool has been taken around 32c, but growers there prefer to wait.

Consuming trades are using the releasing of 50,000 bales, or about 25,000,000 lbs., of Australian wool for this market as a bear argument; but it is evident that this will only partially relieve the general shortage. War order are still being placed without hesitation, and even an early end to the war could hardly affect the spring clip; while it is reliably reported that the large sales of lambs will result in a very light clip. It is also probable that the Australian wool coming this way will not be of the best grades, which will give the California clip a better chance. The Boston market is dull, with buyers waiting; but by the time shearing is well started, it is believed they will be compelled to enter the market, and to meet the growers at least part way as to prices.

Hide Market Demoralized.

The hide market, after a long period of high prices based on the war demand for leather, has become badly demoralized from the persistent talk of early peace. Prices are still declining, with no bottom in sight, and both dealers and tanners appear confident of much lower values. Eastern tanners are buying practically nothing, and local tanners are keeping out of the market as much as possible, though compelled to buy some for actual needs. This keeps local values rather above Eastern, as they have been for several years.

Prices are still far above normal; wet salt country hides at the beginning of 1916, when the war demand had had but little effect, were worth about 16 1/2c, while they are now quoted around 21c. The recent prices have been based entirely on abnormal military demand, and in view of the widespread opinion that the war will not last beyond next December, the outlook for further war purchases is considered doubtful. Dealers believe that, with peace definitely in sight, the market will drop heavily to abnormally low levels, with a probable return of high prices when the European reconstruction begins.

Country holders have so far taken a firm stand, quite generally refusing to accept the low prices named, though nothing can be sold except at concessions. No doubt a stampede to sell would bring an immediate drop to much lower levels, as there is believed to be a considerable supply in the country, as well as liberal stocks in packers' hands. It is possible, also, that renewed war orders may justify higher prices; but the outlook can hardly be considered encouraging to sellers.

Prospective Shortage in Barley.

The large shipping demand, and the local feeding and seeding use, has about cleaned up the 1916 crop of barley. On Dec. 1st the Chamber of Commerce of San Francisco reported stocks in the State of 240,000 tons. Since then there has been sent East, mostly for export, between 75,000 and 100,000 tons of shipping barley. The usual amount consumed in the State at this season is 30,000 tons per month for seed and feeding, but owing to high prices, it is estimated that the consumption is about 20,000 tons per month. At this rate the stocks will be depleted by July 1st. Practically all shipping barley has been exported, the order for 5,000 tons filled by the E. C. Horst Company this week having about cleaned up this variety. The Horst Company has shipped about 75,000 tons this season, mostly to Europe, for which it paid from \$1.25 to \$2.40. There is still some Eastern and European demand to be filled.

Fair Outlook for Horses.

A large lot of stock was put up for auction in San Francisco this week, including a good many drafters from a contracting company, as well as young draft stock from the country and medium-weight wagon horses. Buying was hardly as brisk as a fortnight ago, which was attributed to the cold weather. An early revival is expected, and the leading local dealers look for a good demand during the early spring, as there seems to be a great deal of interest on the part of country buyers. Buyers for the European nations also are getting into the market again, and are expected to make purchases in this market if they find suitable offerings at satisfactory prices. Their purchases were an important factor last season, taking up a large part of the available stock, and this is no doubt partly responsible for the present country demand. There is very little demand locally. The general range of prices stands about as for some time past, though quotations can be only approximate.

The Only Tractors With Renewable Inner Cylinder Walls

With an Avery Tractor if your cylinders become worn or scored all you have to do is to put in new cylinder walls. But with all other tractors you must have your old cylinders rebored and fitted with oversize pistons and rings or buy complete new cylinders, either of which is very expensive and causes serious loss of time.

OTHER THINGS YOU GET ONLY IN AN AVERY

Only Averages have sliding frame, two speed, all spur gear, four wheel, double drive transmission. Only Averages have no fan, no water pump, no fuel pump, no outside lubricator, no belts, no sprocket chains. Only Averages have a standardized design—five sizes—all alike.

THE PACIFIC RURAL PRESS

SAN FRANCISCO

FEBRUARY 3, 1917.

LOS ANGELES

Winning a Butterfat Prize on a Fruit Ranch.

[Written for Pacific Rural Press]

A 40-acre fruit ranch that needed fertilizer, two husky farm boys, scarcely out of their 'teens, having an unusual amount of good sense and practical ideas—these were the controlling factors in the winning of the \$25 monthly prize offered by Pacific Rural Press in the California State Dairy Cow Competition for the month of December.

To fully relate the story of how the prize for having had the five highest-producing cows in a grade herd, headed by a purebred sire, entered in this competition was won, it is necessary that the reader go back two years, to the time when F. O. and K. U. Bohnett assumed the management of their father's fruit ranch, near, Campbell, Santa Clara county.

High Priced Land.—At that time they were confronted with this situation: They were farming land with a valuation of \$1,000 an acre which was not paying interest on the investment plus labor charges, etc. Prunes were the chief source of income, as about 30 acres of the ranch was in a 25-year-old orchard of that fruit. The average yield at that time was a little more than 50 tons per year of dried fruit, a fair yield for the district, but insufficient to meet their rental.

Three procedures were decided upon in the hope of securing larger yields, viz.: a pruning system which would open up the centers of the trees and allow more sunshine to reach that portion of the tree, and at the same time promote new growth; a change from winter irrigation to cover-crop planting, and irrigation in spring and summer months when moisture from rainfall is not available; the establishment of a dairy in order that a sure and economical supply of fertilizer might be supplied to the orchard lands.

Just which of these factors has been most important, Bohnett Bros. do not attempt to say, but they do know that the prune crop for the two years has averaged 100 tons per season, and that the apricot, pear, and prune trees which have been fertilized with the barnyard manure have put on a bigger growth than ever before, and are theoretically in better condition to yield bigger crops. Also they know that the size of their prunes has increased from 65's to an average of 55 in 1915 and 53 in 1916.

Sell Milk.—The dairy was started on a small scale, even before active management of the place was assumed by the brothers, the surplus milk of the two family cows owned by their father being distributed to residents of Campbell. All of the feed for these two cows had to be purchased at market prices, as the five acres outside of the orchards was given over to building sites, corrals, and drying yard. But even under this handicap the two cows more than paid their way in milk and supplied a valuable lot of manure. When enlargement of the dairy was decided upon Bohnett Bros. realized that the old two-stalled shed and other out-

of-date equipment must give way to more modern and sanitary surroundings if their milk route was to be enlarged.

Cheap Buildings.—Starting with the milking shed, they tore out one wall, extended the side-walls with 1x12 boards, and added to the roof. A concrete floor was laid, steel stanchions for seven cows erected, and a one-unit Hinman milking machine installed. By cutting holes in the side-walls for ventilation and whitewashing the entire interior, they now had a homely but sanitary and cheaply constructed milking stable.

Cost Carefully Considered.—Finances, as well as sanitation and convenience being a consideration, the work of constructing the milk-house was done by the two brothers also, the building being 12 feet wide and 16 feet long, with a comparatively low roof, a three-foot screened opening around the entire building at a height of about three feet from the floor for ventilation and light, and having a well-drained concrete floor. The material for this building cost \$50. This building was

equipped with a sterilizing vat, a bottler and bottle-washer, and milk cooler. Steam and hot water were provided from a small boiler set just outside of the building and the cooler was supplied with water from a galvanized tank located on the north side of the building, which is covered with burlap. A drip faucet supplies water enough to keep this burlap wet, and the evaporation from the wet burlap cools the water inside the tank to about 10 degrees below the temperature of the well-water.

Protection for the Cattle.—With an early appreciation of the value of protection for the cows from rain and cold, a shed roof, 16 feet wide and 80 feet long, was erected alongside the feed-barn, which is 50 feet long and 16 feet wide. As shown in the illustration, neither of these buildings was expensively made, but both are efficient for their respective purposes. The feed barn holds 75 tons of chopped alfalfa, and with small hinged doors along the side adjacent to the feed-shed, it is possible to move the greater portion of the hay from barn to manger in front of the manger.

Conserving Manure.—

But protection of the cattle is not the only good feature of the feed shed; it conserves the manure as well, for in wet weather the cows spend a good portion of their time under the roof, and by keeping them well bedded down with straw, and hauling the manure out as often as the weather will permit, there is little leaching of the manure. With this same idea of conserving fertility, and the additional reason of sanitation, the manure is moved out of the corral every day in fair weather and as often as possible in the winter, resulting in a comparatively dry corral, as shown in the accompanying pictures, which were taken early in January.

We have dwelt thus long on conditions and equipment because both

HOME MARKETS AND CALIFORNIA PRODUCTS.

IT SEEMS to us that if those who are now claiming public attention for their declarations that it is the duty of the State to coddle local consumers, and either let the producers go hang, or else proceed actively to hang them as trust-makers and conspirators, would open their minds to an appreciation of California production as related to local consumption, they might feel the uplift of clearer, broader, and more truthful views. One of these home-consumer advocates, whose writing we happen to have seen, says this:

"The State markets, as provided for in the State market act of 1915, afford an opportunity to the farmer to consign his products to the State market director, who is authorized to sell such products and remit to the farmer all the proceeds, less a reasonable percentage for the maintenance of the market. From this it will be seen that the inevitable result will be that the natural law of supply and demand will be allowed to operate, as the producer will receive more for his labor, the consumer will be enabled to buy for less and the market will be self-sustaining. Home markets will be taken care of first and surpluses sold elsewhere."

It is easy to see the place and the period whence this writer drew such an economic philosophy. It belongs to a backwoods community of a generation ago, when the local dealer swapped groceries for produce, and, as he accumulated surpluses of kitchen-dried apples, eggs, butter, smoked meats, etc., barreled them and shipped them to a city receiver. In that way and in that time the home markets were the entrepot to distribution of surpluses, which could not be locally sold for cash or traded to a broader demand. To cite this as the way to dispose of surplus products profitably—this making of the home market the gateway to such distribution as our products require, shows how little such a writer knows of these products and of California. It is recorded that California's surplus horticultural products alone in 1915 filled 158,415 cars for shipment beyond State lines. The selling value of these may have been one hundred million dollars, of which the growers received about one-half—the other half going for packing, trading, and transportation. It is such money, which comes from beyond the State, from these and other products, that gives our California consumers money to buy with and to live a large life largely as they do; and to put forward such consumers' comforts as ground on which to promote producing enterprises is to substitute the effect for the cause.

TWO HOARY OLD CROOKS.

IT IS getting to be almost amusing to see how nearly all who start out to perform for the admiration of followers in their consuming centers, invoke those two old crooks, "Supply and Demand," as their house-gods. They are surely economic idols, for they are exactly what you make them, and when you fall down before them you worship the work of your own hands. It seems almost incredible that even sawed-off local economists, who cannot see over their own back-

fences, could be so stupid as to argue that supply and demand in our home markets should have anything whatever to do with the needs of the great producing industries of the State. In the case of the products indicated above, they have absolutely nothing to do, and can have nothing, because the figures are surpluses over and above all local consumption. In the total marketable products of the State, the local consumption is exceedingly small—possibly not one-thirtieth of our local production. Let old Supply and Demand seesaw as they like in our local markets, or let them be regulated and controlled by the State, for we have no objection to that, but its relative littleness in public importance. In either case they would demand nothing nor supply anything which would compare in importance with advancing both demand and supply for something like five hundred million dollars' worth of California products, which must find markets abroad in this country and in the world. In this issue, upon which the future development of the State depends. Demand must be planted and developed, and Supply must be increased and improved, and it is the duty of the State to organize and assist producers to do these things, for no other people either will or can achieve it. And when the State tries to do this supreme duty to present and possible producers, the State is arraigned for promoting trusts, and producers are lambasted for conspiring to get a profit which will enable them to increase production! And the legislature is besieged to secure action which every board of town trustees or of county supervisors is fully empowered to undertake.

COLONIZATION CONTROVERSY.

AT ITS last meeting the Sacramento Valley Development Association received a report from its "Colonization Committee," taking issue with the findings and recommendations of the report of the State Commission on Land Settlement and Rural Credit, which were outlined in our issues of Nov. 11 and 18 and Dec. 16. It is a carefully prepared document, and in its argument in favor of leaving colonizing efforts to private enterprise instead of assuming them as a function of the State, it is about as strong as a showing on that side of the question can be made. We presume it will be published in pamphlet form, and that copies may be had in due time from the well-known manager of the Association, W. A. Beard, of Sacramento. Although we dissent from phases of it, we commend it for study by all interested in the public and private questions involved.

The report contends and cites instances to prove that "colonization is a demonstrated success in the Sacramento Valley," in this way:

There have been failures due to various causes, but in every instance we are able to call to mind, where the land has been suited to intensive agriculture, where the company has been properly financed, and where sufficient time has elapsed, the projects have developed into prosperous communities. Men have attempted to colonize dry lands and others lands unsuited to intensive culture or requiring treatment beyond the means of the settler. Some have attempted it without sufficient capital, others have made various mistakes, no doubt; in some instances, actual fraud has been practiced. The fact remains, however, that colonization projects rightly conducted, have succeeded and are succeeding today in the Sacramento Valley.

We are quite sure that this carefully guarded statement is true, but does it not occur to the reader that there are exceptions enough taken to cover more individual losses, hardships, and disappointments than are good for the settlers themselves, or for the State? As we understand the position of the Land Settlement Commission's report, it was a claim that there was plenty of good land, and that colonization efforts properly located, promoted, and financed, should succeed. The Development Association committee contends that such efforts have succeeded, and are succeeding. We are glad that the briefs of plaintiff and defendant show substantial agreement as to the facts in this general way. It seems clear that proper efforts at land settlement make for the prosperity of the individual and the good of the State.

WHAT A SETTLER CAN DO.

THE report of the Development Association cites many instances to show that the "valley is not in a state of arrested development," and that "all over this valley, on single farms and in groups, the development of land through small holdings, irrigation, intensive culture, planting of trees, vineyards, etc., is progressing right along." It also says: "Evidences of this may be seen in the extension of irrigated areas, in the rapid increase of pumping plants for irrigation, in new farm homes, recently planted orchards and alfalfa fields, which are to be seen in greater or less number in every Sacramento valley county." This is also perfectly true, according to our observation, and as our readers, who are taking part in such development also know. The committee also reasonably contends that "land prices in the valley are not unduly inflated, and are fully warranted by the potential productiveness of the land," and instances are given thereof. We do not, however, note the connection of any of these remarks with colony enterprises, recognized as such, which is perhaps an oversight on the part of the committee. However, the way in which a colonist may establish himself on such good land is very frankly remarked in these words:

It is beyond reason to expect a colonist to pay for a valuable farm wholly out of the earnings of that farm, especially in the comparatively brief period of five years. No reasonable person should expect to pay for a valuable farm wholly out of the earnings of that farm any more than he can expect to acquire a valuable factory or store by the simple process of taking possession and operating it. The acquisition of property calls for the investment of capital and the person seeking to buy valuable farm land should expect to invest some capital in it. It is certainly asking altogether too much even of the fertile and productive lands of the Sacramento Valley that they shall yield to the settler in addition to living expenses, water costs, and interest, the twenty per cent a year necessary to enable him to pay for it in five years.

This we must regard as a rebuke to some colony promoters, or their sales' agents, for such have surely convinced settlers that investment beyond the first payment was unnecessary, for the land would do the rest. If we remember, there was some years ago a widely printed circular that the land would do it in three years. We are glad that the Association is developing more conservative views.

PRIVATE OR STATE ENTERPRISE?

WE ARE quite in sympathy with the position taken by the committee that it is American for land improvements, subdivision, and sale to be handled by individual initiative and enterprise rather than by the State, and that such attitude toward land has had something to do in making Americans what they are. It is put in this way:

The central purpose of the report of the Land Settlement Commission seems to be to urge the adoption here of a State-aided and controlled land settlement policy, such as prevails in countries of the old world and some of their colonies. We hold that the adoption of such State-aided and State-controlled land settlement at this period of our national growth would be detrimental rather than beneficial. It may be that the adoption of such methods in this State would operate to reduce the percentage of failures on the land, but if so it would be at the expense of the element of competition, in violation of the rule of the survival of the fittest, through which we have developed in these United States a superior race and a superior nation.

This is, of course, a great patriotic idea, and the question is, Can we afford to indulge in it at the expense of the losses, disappointments, and hardships which it has entailed upon so many people in recent years? The exploitation of men and women to their great detriment by disgraceful colonizing impositions is, rather a new smartness which unscrupulous people have acquired. Our grandfathers developed much truly American acuteness by skinning each other in horse-trading, but we doubt if they would skin each other's families in such land swindles as have been perpetrated by this generation. Shall the State make such action a crime and repress such over-exuberant Americanism in the penitentiaries, or shall it assume the responsibility of teaching a better way

by colonizing qualified, landless people through its own system of settlement and financing? This is the question which we shall not undertake to pursue at this time.

A STATE DEMONSTRATION.

WE HAVE briefly sketched the formal response of the Sacramento Development Association to the recommendations of the Land Settlement and Rural Credit Commission for two purposes: one is to advise them that the broad suggestion that the State should do it is controverted by an influential association of those interested in development; the other is to make clear the fact that there is no legislative proposition pending, that the State shall do any such thing. We are anxious that this last point should be clearly understood, because, if not, there might be prejudice aroused against a proposition which has actually been introduced that the State provide for a demonstration of rational and properly financed colonization on a limited scale, so that all may see how it works out in actual practice. Such a demonstration as is provided for by the bill introduced in the State Senate by Senator Breed, does not commit the State to an undertaking to displace private enterprise, but it does bring the matter to a test which may enlist the people to its extension, or it may be very valuable in showing how private or corporate colonizing undertakings must proceed to attain results most widely desirable for the success of individual settlers and the upbuilding of the State. The purposes of the proposed law are stated as follows:

"With the object of promoting closer agricultural settlement, assisting deserving and qualified persons to acquire small improved farms, providing homes for farm laborers, increasing opportunities under the Federal Farm Loan Act and demonstrating the value of adequate capital in organized direction in subdividing and preparing agricultural land for settlement, there is hereby created a State Land Settlement Board to consist of five members, appointed by the governor to hold office for a term of four years, and to receive per

diem compensation for actual service and expenses in discharge thereof.

The operations of the board thus created are limited. It may acquire, on behalf of the State, agricultural lands in California that are susceptible of intensive culture and suitable for colonization in an area of not more than ten thousand acres, and they may subdivide and sell such lands, with appurtenant water rights, to approved bona fide settlers, in areas suitable for farms and farm laborers' allotments, and, where necessary, construct roads, ditches, and drains for giving access to and insuring proper cultivation of the several farms and allotments. It may also prepare the land for irrigation, build fences, construct dwellings and outbuildings, to a cost of not exceeding \$1,500 for each farm; make loans to approved settlers on the security of stock and implements to an amount not exceeding \$3,000 on each farm. It may also sell such farms, with a value of each not exceeding \$15,000, to actual qualified settlers, who do not own other agricultural lands valued at more than \$15,000, and only one such farm to each settler. Such sales may be made on loans with amortizing payments covering not more than twenty years at 5 per cent, with the right to repay the loan at any time after five years. To finance the operation the State shall create a revolving fund of \$260,000 in the hands of the State Controller and State Treasurer, which it is calculated shall be fully returned to the State within fifty years with interest at the rate of 4 per cent.

Thus the State finances, with larger interest on its funds than it now secures, this State demonstration that a tract of land can be subdivided and settled in small farms at little more than the actual cost of the land and its improvements without large commissions and overhead expenses, which too often make land too high to enable settlers to make good—provided the settler knows how to handle himself and the land, and such only will be accepted as settlers. This undertaking proposed for California is awakening wide interest throughout the country.

an early-planted late potato but a late-planted early potato. This is what we should call the chance crop which you secured. Your May-dug Early Rose was so mature that it was good seed for another crop. On properly moist soil on the valley plains you can plant in the summer and get a fall crop of new potatoes instead of holding over late varieties from winter and spring planting. Planting early varieties in September will give you profitable potatoes for winter—unless you are in such a frosty place that the tops are killed before the tubers are well along. The American Wonder works well on that plan.

Wood Ashes on Light Soils.

To the Editor: We burn white oak wood and have lots of ashes. Our soil is a red sandy loam. Is it advisable to scatter the ashes on the ground? What are their properties as a fertilizer?—J. A. F., Sacramento.

The chief value in wood ashes is potash, but they also carry considerable lime which is useful. They are particularly wholesome to light soils because they have some influence toward compacting and rendering them more retentive. They are best spread at the beginning of the rainy season so their potash may be leached out and distributed, but can be used now if you are not going to put in seed right away. Fresh ashes may interfere with germination. Put them on your corn, tomato and melon land, and they will be innocent by planting time.

Japanese Pear Root and Oak Fungus.

To the Editor: Considering the fact that pear blight has not been very prevalent in the Napa valley, I wish to ask what pear root you would advise planting on an oak root fungus patch in an old prune orchard where conditions of moisture have caused sour sap with dead or sickly trees resulting. Has the Japanese root been found suitable for all conditions?—O. S., Napa.

So far as we know it is the long-used European pear root which has won the reputation of resisting oak root fungus, standing water and alkali. We are not aware that the Japanese root has had a chance to disclose its attitude toward all these troubles, although there is good theoretical ground for expecting that it will stand them as well as the other. If you care less for blight and more for the root fungus and wet feet, you had better plant the root which is known to come through those troubles.

Hand-Work Around Trees.

To the Editor: I have trouble making my plowmen show proper respect to the bark of young trees. Do you think it is a good plan to have a man hoe or spade around the trees before plowing, and how deep should he go?—Beginner, Alamo.

It is surely a good plan, but it is usually done after plowing so you can see just what undisturbed soil needs working. Careful growers repeat the process several times, after cultivations also. Loosen up the ground five or six inches deep and pulverize well. A good plowman with a proper rig will very seldom strike a tree even when working quite close to them, as he should.

Sunburn Borers.

To the Editor: Last year I lost several young fruit trees by a small worm that bored into the heart of the tree, entering the trees just above the ground. What can I do to prevent further damage to trees?—J. P. H., Merrillville.

Whitewash the stems down to the main roots to prevent sunburn. Do this when the buds begin to swell and renew it as may be necessary to keep a good white color on the bark.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco, for the week ending at 5 p. m., January 30, 1917.

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Corn Going Wrong.

To the Editor: Ten acres of yellow dent corn planted June 1st, after irrigation and disking of land which had been plowed a month earlier, was very poor. It had two cultivations and, on the whole, the corn grew to good size but none of the ears were hard and solid. Only a few were perfect and 75 per cent were defective in that the cobs were not filled with kernels, some being complete blanks. Ten per cent was smut. The incomplete filling of the ears was strange. Some yellow flint planted at the same time and under like conditions was very much better. I have noticed for some years that corn in this valley is very shallow and loosely rooted in contrast with the firm rooting in the East. How is this explained when roots are supposed to seek the moisture? The seed was fine and said to have been raised in this valley.—J. J. B., San Jose.

This calls for a good job of guessing. The dent corn which went to the bad was a poor variety for your conditions, though it might do better under different conditions or in other years in your valley, as the seed seems to indicate. The bare or scant cobs were due to lack of pollination, which may be attributed to the weakness of the variety or to too dry heat at the pollen time of the tassels, or some other cause. The flint corn may be a stronger plant or it may have dodged some condition which affected the other. There is also a guess that the corn needed irrigation to help it through with the growth which apparently started along well while there was enough moisture in the surface soil in the fore part of the season. The shallow rooting also indicates drouth in the soil. Corn is not a very deep-rooting plant on the whole, but it can go down pretty well if there is anything to go after. We should try some other seed this year and put in some Kafir or milo to see if you cannot get better results with one of these drouth-resisting sorghums.

Russian Melons and Stock Beets.

To the Editor: What is the time of the year to plant Russian melons and where can I get the seed; also, what demand will there be for such a crop, and how close should seed be planted? When shall I plant mangels to make fall feed? Is the long red mangel best, or do you recommend some other? Is it possible to get a crop of these for spring hog-feeding between drying up of green feed and when grain stubble becomes available? How much seed does it take per acre and how planted?—G. C. S., Tudor.

We do not know the Russian melons unless someone is renaming the Persian melons in accordance with Russian domination in that quarter. If then they belong to the Casaba group of late fall and winter melons, any of our advertising seedsmen can fill your order. Seed should be planted when safe to plant corn—in six feet squares. On moist land you can plant mangels in May or June for late fall and early winter use. For spring feeding they should be started in November, but may be put in now, if the land is not full of cold water. If it is, wait until it warms and mellow, and feed before getting full size, if you need them. Plant in drills two feet apart and use about five pounds of seed per acre. Do not cover too deeply at this time of the year.

Late Fall Potatoes.

To the Editor: What is the best kind of potatoes to mature in the fall of the year and what is the planting time to get best results? Last year I planted Early Rose and dug them in May. In some places the potatoes were covered up in the soil and matured into a splendid spud from October 1 to 15. What species of second crop would you name this crop? My object is to get the best potato possible for the winter market.—Subscriber, Selma.

The standard late potato in California is the Burbank. But, according to your own experience, what you need to meet your requirement is not

Grapefruit and Oranges.

[Written for Pacific Rural Press.]

That citrus fruits, especially pomelos and oranges, grow to greater toothsome in Imperial Valley than elsewhere in the State is affirmed by C. A. Hagerty, who has some 50 or 60 orange, lemon, and grapefruit trees, mostly seven years old. Certain it is that the oranges picked for the writer late in January could scarcely be equaled for flavor, sweetness, tenderness, and juiciness, though the texture of their skins was not above the average. And Imperial county pomelos are well known as being delicious to eat out of hand; which has never been said by the writer of any other pomelos except some from Florida.

Mr. Hagerty's trees had been suffering from the cold weather, the pomelo foliage was somewhat yellow and dormant, the lemon foliage slightly mottled, but all but three of the navel trees had a healthy color.

Grapefruit picking commences in mid-November. Navels are sweet Dec. 1 even before they look ripe, and lemons for Mr. Hagerty all come in one crop later in December. Harvesting continues as long as fruits are left, but they keep in good condition on the trees through the winter. Everything is sold locally at higher prices than imported fruit brings. A two-year pomelo tree yielded 25 large fruits last season.

Pruning might help the trees; only dead brush and suckers are cut out of the pomelos and oranges. Lemons are pruned more severely.

But there is no lack of manure fertilizer. Hen manure was scattered about the trees while they were young, and the farm manure is applied heavily. Ten loads had recently been applied to 24 trees and plowed under, making this hard heavy land quite mellow, at least on top. But the subsoil is a yellow clay.

Frost has never hurt the grapefruit trees here at all; though during the big freeze a lot of orange and lemon trees were frozen back nearly to the trunks and some of them never recovered. Lemons proved tenderest.

The ground was plowed both ways, in December, deep as two horses could pull a single plow, within six feet of the trees, but without striking any roots. He used to cut them at Riverside, and he believes their greater depth in Imperial county is due to more efficient irrigation. His idea is to get the ground wet way down in winter and then irrigate weekly through the summer to prevent the trees drying out or the leaves wilting. In this soil, the water does not seep sideways very much, though it seems to go down pretty well. Three trees where the dirt was higher than usual above the furrows showed the need of something, which Mr. Hagerty said was water. They are irrigated late in January; as an irrigation last year when just coming into bloom is blamed for the blossoms falling without setting.

Increasing the Malaga Crop.

[Written for Pacific Rural Press.]

A. B. Cate of Fresno county produced a big crop of Malagas averaging at the time of our visit one and one-third packed crates per vine which were netting him a little over \$1 per crate. About 2000 crates had been picked Sept. 15 and the total crop was thus indicated as over 600 trays.

There were 8½ acres of full-grown vines and 1½ of young vines. They were cultivated before plowing or pruning, to hold moisture until plowing. They were pruned Mar. 15-28, 1916, leaving fat spurs longer than ever before and a few more of them. Amount of pruning was based on the strength of the vine as indicated by the amount of last year's growth finished thoroughly, and the number of water-sprouts.

When shoots averaged four to six inches long and before blossoms opened, the vineyard was plowed and immediately cultivated to hold moisture.

On April 25, three men spent 10 hours pinching tips from most of the outside shoots just above the forms of bunches which had appeared. Then from May 1-10, fifteen actual days' labor were spent pulling off all shoots which did not have fruit bunches, and pinching the rest. Total pinching cost about \$3 per acre. It caused laterals to shoot forth quickly and produce heavy second-crop bunches which matured before all of the first crop was picked.

Sulphuring began just before pinching. It was repeated at intervals never over 10 days until Sept.

1. Sulphur was applied at ¾ to 1½ sacks per acre with a knapsack machine. The men were instructed to shoot every leaf and bunch. To get undersides of leaves, the spray tube was held level, with the flattened angle nozzle shooting upward. No mildew had developed up to the end of September.

The vineyard was not irrigated until June when it was cultivated both ways. Cultivation and irrigation were then given as needed by the vines, not worrying about water-berries and getting very few. The crop and quality were better than ever before, the bunches larger and more uniform while berries were large and of finest quality.

ACREAGE IN FRUIT.

According to the State Board of Equalization there are approximately 11 million non-bearing fruit trees in California at this time, of which 40 per cent will come into bearing this year. The bearing and non-bearing acreage of the various fruits are given as follows:

Varieties—	1916. Bearing.	1916. Non-b'r'g.
Apple	2,029,273	1,142,038
Apricot	2,598,928	879,559
Cherry	623,438	335,138
Fig	507,814	131,664
Olive	934,739	515,221
Peach	11,123,149	1,082,149
Pear	2,027,751	699,310
Plums	1,166,630	177,556
Prunes	8,880,335	1,082,411
Lemon	1,558,971	1,019,729
Lime	831	190
Orange	8,237,115	2,227,573

Fruit trees often start to blossom when their roots are inactive.

PEACH ROOT BORER IN HEMET DISTRICT.

[Written for Pacific Rural Press by
D. D. Sharp, Horticultural
Commissioner.]

On page 79 of the Pacific Rural Press, under date January 20, 1917, and under title "deciduous fruits," I see an item about the work being performed for peach tree borer in the Hemet district, Riverside county. The party who sent in that item certainly was some humorist.

I will give you an outline of what is really being done. During early summer of 1916 we discovered traces of an infestation of peach tree borers in the Hemet district. It being too late to perform any work at that time, we laid our plans for work in the fall. In view of the fact that in these orchards where we discovered the peach tree borers there is considerable exposed crown gall which contains numbers of the borers we decided that the quickest and most effectual way, while digging for borers, was to cut off the crown gall, the same being placed in sacks or boxes, piled up and burned. The spot from which the crown gall was removed was painted over with Bordeaux paste. This ended the operation.

The work being done at the present time is being done with the co-operation of the growers and would say that it has not been necessary for me to enforce the work as yet in a single instance. This method has been employed by me for the last three years in the Banning district and has been considered very successful and effectual by the growers and by my inspectors.

Riverside.

PEACHES FOR IMPERIAL VALLEY.

[Written for Pacific Rural Press.]

Not over 10 per cent of the land in Imperial Valley is fit for fruit, as estimated by E. H. Erickson, a pioneer and still successful fruit grower on the "soft" land near New River.

Some varieties of peaches bloom so late that they do not pollinize right, and thrips are likely to get them. Mr. Erickson is raising some of the Waldo peach, an early white-fleshed freestone with thin reddish and yellow skin. It is a little later than the yellow St. John, which is favored. Twelve other varieties have been tried, including the Strawberry, which proved too watery. The Alexander and other varieties are too late. They harden half-developed on account of the heat of summer. Peaches bloom generally in February and the St. Johns ripen from mid-May to June 1st.

The principal thing to watch with peaches in Imperial valley, says Mr. Erickson, is the pruning. They make great wood growth on account of the long growing season and must be severely pruned. Yet he has never tried summer pruning except to pull out the water-sprouts, for the trees need the shade of all their foliage. One orchard summer-pruned in Imperial county died two years later; and lots of trees sunburn. Not many peach orchards are to be found in the valley.

Farmers in the Reedley district are planting a large acreage to Thompson Seedless grape vines this season, according to a Rural Press field man.

Don't Delay in Ordering Your NURSERY STOCK

We still have a complete stock of quite a few different varieties, but we urge immediate orders as the season has advanced to actual planting time.

Place your orders while the stocks are intact. We have everything in Trees, Vines and Shrubbery.

Almond Varieties Compared.

To the Editor: In the issues of Pacific Rural Press for January 6 and 13 you have had articles on almonds in both of which the relative productiveness of the almond varieties were mentioned. I give below a couple of tabulations showing the returns in pounds and also in dollars and cents for each variety of each of four young almond groves here. These cover just the first three years of bearing, which is not sufficient time upon which to pass a fair opinion. This past year was a very poor year for the Drakes here, so I believe that with next year's returns averaged in the Drakes will come up in the class of the first three varieties.

Roots for Fruit Trees.

To the Editor: Adding to what you give in this week's issue of "What Fruit Tree Planters Should Know," the following information may be of some value to prospective fruit planters.

Pears will make good growth planted in light silty or sand-and-silt soil where water is near the surface. Apricots, on the contrary, will not, but for all light sandy soils, where other conditions are right, the apricot will do well if planted on apricot root, but not on myrobalan root. Also, for sandy soils, the French prune does better on the almond root than on the myrobalan root.

I have had considerable experience with both soils and roots, and while convinced of the merits of the myrobalan root in general, I would call attention to the above facts as preventive of disappointment and discouragement in planting on land not generally considered first-class fruit land, but which may also be that.

If proper judgment be used in selecting the right root for the variety of tree to be grown and kind of soil planted in. H. W. Yolland.

Paicines.

A FIG GROWERS' POOL.

As a result of the fig institute recently held at Fresno two large fig growers south of Fresno have started a canvass in all parts of the San Joaquin Valley in an effort to form a pool of the 1917 fig crop in order that a uniform price may be secured by all growers. The pool includes White Adriatic, Calimyrna and Black Mission varieties. It is probable that the ultimate result of this will be a fig growers' association. Because of this packers are said to have put twenty buyers into the field contracting for the 1917 crop.

One of the palms at the Imperial Valley Experiment Station yielded 150 pounds of dates last season, according to Supt. W. E. Packard.

This is to advise that we will demonstrate and take orders for the BEAN SPRAY PUMP COMPANY'S CATERPILLAR TRACTOR at the following places and dates:

El Monte—Friday & Saturday, Feb. 2 & 3.
Duarte—Monday, Feb. 5.
Monrovia—Tuesday & Wednesday, Feb. 6-7.
San Gabriel—Thursday, Feb. 8.
Glendale—Friday & Saturday, Feb. 9 & 10.
Burbank—Monday & Tuesday, Feb. 12 & 13.
San Fernando—Wednesday, Feb. 14.
Owensmouth—Thursday, Feb. 15.
Lankershim—Friday & Saturday, Feb. 16 & 17.

You are cordially invited to be present.

Only \$950 If You Order Now

Don't Use Costly Horses Any Longer for Orchard or Vineyard Work. This 2800-lb. TrackPULL Tractor Does the Work of Six Horses for What Two Horses Cost to Keep. Only Tracklaying Type Selling Under \$1800 that Will Work Satisfactorily in Orchards.

You can do two things to make your land earn more money—increase your yield, or decrease your operating cost.

Now comes a wonderful little tractor to help you do both—a tractor built by the makers of the famous Bean Spraying outfits.

Only 2800 lbs. weight means an upkeep cost reduced to the minimum, yet patented construction provides a six-horse traction! Great combination! a two-horse upkeep cost, six-horse pulling power, and a buying price of only \$950 cash (if ordered now). On account of the increased cost of high-grade material the cash price advances to \$975 on February 10th.

The BEAN TrackPULL plows up within an inch of the vines in a vineyard without

breaking off young shoots. Goes under tree boughs only four feet off the ground (where no horse can go) in an orchard. Gets into the corners. Turns inside a 10-foot circle. Pulls instead of pushes itself over the ground and pulls as strong on turns as on the straight-away. "Gee's" and "haws" like a team. Pulls out of soft spots instead of digging in deeper. Works 10 hours a day at full speed, if necessary, never tiring, and eating only while working and making a profit for you. Powerful motor runs stationary machinery when tractor isn't in the fields. Why do without such a producer?

Considering what the BEAN does it's the lowest-priced tractor in the world at almost any price. Get in touch with us today.

SPRAY GRAPES EARLY FOR MILDEW.

[Written for Pacific Rural Press.]

Grape mildew spores are resting now, awaiting the favorable conditions of spring to start the usual bunch of inquiries how to prevent it more effectively than by sulphuring.

Thorough sulphuring, at times when the sulphur may evaporate, and as often as new spores might germinate, has proved too much of a problem in many cases.

J. McKindley of San Joaquin county had lots of mildew in the season of 1915. He had only a little in 1916 and hopes to have less in 1917.

He sprayed about 20 acres of eight-year Tokays last spring when the shoots were 10 to 12 inches long, and sulphured three times afterward. The spray was atomic sulphur, twelve pounds per 100 gallons of water. The vineyard will be sprayed twice next year, as the atomic sulphur sticks better until favorable weather for its work, and presents finer particles to the action of heat to evaporate it than does flowers of sulphur. Earlier spraying would catch spores that may start working when shoots are only a few inches long.

Mr. McKindley used a handpower pump, aiming at 125 pounds pressure, but thinks more pressure would be better. With a 200-gallon tank and two leads of hose, he sprayed about four acres a day. Use of power sprayers might have been cheaper and more effective.

SULTANAS OR THOMPSONS?

To the Editor: Why does Jas. Madison of the Associated Raisin Co. advise planting Sultanas rather than Thompsons?—Subscriber.

This query was referred to Mr. Madison, but he has not seen fit to answer. According to Roy Dewhirst of Fresno county, there are so many Thompsons now planted but not bearing, that it may be hard to find a market for them when the end of the war shall open our markets to the cheap Greek "currants." The Sultana being so near like Greek currants, and being a surer crop, with less wood growth and bearing more fruit than Thompsons according to Mr. Dewhirst, makes them probably preferable to the higher-priced Thompsons for planting now. He is the Associated Company's agent for a large territory south of Kings river, and is advising Thompsons for old men who want quick money, but Sultanas for young men who look farther to the future. He looks for the price of Sultanas to equal that of Thompsons not many years hence; for the Sultana acreage is very limited.

VINEYARD QUESTIONS ANSWERED.

[Answered by Frank Henry, Fresno.]

Melilotus Cover Crop.—I am thinking of sowing melilotus in my vineyard, which is over 20 years old. Do you think, if put in immediately, it would have a long enough growing season if I left it till March, or possibly April, before plowing?

Melilotus can be sown and left until May with good results, both in regards as to melilotus and the setting of his grapes at blossom time,

providing the vines are in shape to irrigate when ready to plow. Don't be afraid of ground getting dry; it is only a benefit to your crop.

Subsoiling Old Vineyard.—Do you think that subsoiling an old vineyard would improve or harm it? My vines are 6x12.—A. R. P., Dinuba.

Subsoiling your center 6 feet will be all right, either before sowing melilotus, or if you do not sow melilotus, just before blossom time is a good time to subsoil, but you will have to irrigate later on in season.

PRUNE AND APRICOT TRUSTEES.

Plant Nectarines

The demand for Nectarines is growing steadily. This luscious fruit is coming into its own. In no place in the world do nectarines thrive better than in California. In the interior valleys the fruit grows to an unusually large size and is of unsurpassed flavor. It possesses a marked advantage over the peach, the skin being perfectly smooth like a plum, thus making it particularly valuable as a dried fruit. More nectarine trees are being planted this year than for many seasons.

We have a large stock of the best varieties and call your particular attention to two leaders: "Gower" and "Victoria." The "Gower" is the earliest of all nectarines. The fruit is very firm, freestone, ships like a clingstone peach, delicious flavor. The "Victoria" is also a strong grower and heavy bearer, ripens in August. Read below what Frank Victor says of it: "I have on my ranch near Fowler 300 'Victoria' Nectarine Trees, which are now 12 years old. These trees have borne good crops and the fruit has sold easily for several years. This year my crop from these trees sold for \$2250.00. Part of the fruit was dried and part was sold green, all of which was shipped to the East and sold quickly."

THE GOWER—the new early money-making Nectarine

We also call attention to our splendid stock of

WALNUTS

All grafts used by us are cut from trees of the very best type which Mr. Roeding has carefully observed and recorded for a period of years. In no other manner can standardization of established varieties be maintained. There are thousands of acres throughout the great valleys in the Coast Counties which are being planted now and will continue to be devoted to Walnuts.

To those who have old walnut trees which they desire to work over it will give us great pleasure to mail our "Bulletin on Grafting."

PERSIMMONS

This splendid fruit, being a little out of the ordinary, is often looked upon as of not great commercial importance. However, it is, and those who avail themselves of the opportunity of planting an acreage this season, will undoubtedly profit by it. No garden is complete without them, and every orchard should contain its quota of Persimmons. Nearly every one has eaten the ripe persimmon, but few have tasted the fruit when dried. It is delicious, and by many thought even to surpass the Commercial Date.

We shall be glad to furnish prospective planters with a list of the best varieties of Walnuts, Pecans, and Persimmons. Our illustrated catalogue lists and prices 2000 varieties of Fruit and Ornamental Trees, Vines, Plants and Roses—Sent Free.

PECANS

Of the eight or nine species of hickories the one which produces the most remarkable fruit and in the most profitable quantities is the Pecan. It is largely due to the impetus the Pecan industry has received in recent years that has encouraged the planting of trees on a commercial scale of the improved paper shell types. The trees thrive in a great variety of soils. Pecans will prove a valuable acquisition to our list of nut fruits in the warm interior valleys of California, Oregon and Washington.

Winning a Butterfat Prize on a Fruit Ranch

(Continued from first page.)

have had a great deal to do with the commercial success of the undertaking. Because of them, Bohnett Bros. have been enabled to produce a milk with a bacteria content of 10,000 per c.c., a mark which many certified plants, with thousands of dollars' worth of equipment, consider especially good. And because of this low bacteria count, the owners have been able to raise the price of their milk from \$2.50 per quart per month to \$3 a quart in a small town—no insignificant feat in itself.

The Cows.—Confronted with the problem of securing cows quickly, in order to put their fertility plan into operation, they were unable to wait until they could breed good cows. Their only course was to buy them, and to use as much care and judgment in the selection as possible.

The first requisite was a healthy cow. Unless she could pass the tuberculin test—and this was administered by themselves—they would not buy her at any price. Naturally they depended a good deal upon conformation, but not wholly. Whenever possible they watched her being milked, they weighed the milk, and took samples. In this way they were able to get a fairly good idea of her producing capacity, and thus it was that they secured all but one of the five prize-winning cows and practically all of the sixteen head of cows now being milked. A high-testing milk is preferred in this selection, the average for the present herd being 4.7%.

But constructive dairying—and that is what Bohnett Bros. believe in—demands that one breed his own cattle and select heifers from the best cows, so a year ago a registered Guernsey bull out of a State record cow was purchased, and now all of the heifer calves are being raised, notwithstanding that all of the feed for them, except skim milk, has to be bought. Daily weighing of the milk from each cow and monthly testing of composite samples have always been the rule here.

Feed.—Purchasing feed is perhaps not the ideal condition for a dairyman, especially in a district almost entirely given over to fruit culture, but by contracting for all of their feed about the first of August they are able to secure it at a minimum figure. Alfalfa hay, dried beet pulp, and cocoanut meal are the feeds used, the hay being chopped as before mentioned because it is believed to effect a saving of at least 20 per cent when fed in that manner, and the beet pulp and cocoanut meal are fed in a moistened condition. In mixing the concentrated ration, 120 pounds of cocoanut meal are used with 200 pounds of beet pulp. Ordinarily a

daily ration of 10 pounds of this mixture is fed to each cow, but more of the cocoanut meal is fed to high-testing cows. Also, the amount of the standard ration is increased to high-producing cows, as is shown below in the ration of the prize-winning cows.

The Prize Cows.—The breeding of the cows that are entered in the State competition is largely a matter of guesswork because of the fact that they were mostly purchased from parties who had in turn bought them from some one else. From the testing percentage of their milk it may be assumed that they all have some Channel Island breeding back of them. In appearance they resemble both Jersey, Guernsey, and Holstein, all being of good dairy type, as may be seen in the photographs. The length of time they were fresh varied, two of them only being on test a part of December, which lowered the general average production for the month.

Spot, in appearance a Jersey-Holstein cross, was the highest producer, giving 1580.2 pounds milk containing 77.67 pounds fat; average test, 4.91 per cent; daily concentrate ration, 17 pounds; full month's test.

Dorris, a big cow apparently about three-quarters Holstein, produced 1198.5 pounds milk, containing 50.81 pounds fat. Average test 4.24 per cent; daily concentrates, 10 to 12 pounds; full month's test.

Dorris, a big cow, apparently about 1030 pounds of milk containing 48.68 pounds fat; average test, 4.73 per cent; daily concentrates, 10 to 12 pounds.

Fayne, on test Dec. 13 to 31, thought to be Jersey-Holstein, produced 997.8 pounds milk containing 41 pounds fat; average test, 4.11 per cent; daily concentrates, 12 to 14 pounds.

Murne, evidently Jersey breeding, on test Dec. 13 to 31, produced 620 pounds milk containing 28.45 pounds fat; average test 4.59 per cent; daily concentrates, 12 to 14 pounds.

Care and Feeding.—The care and feed before freshening given these cows were the same as practiced with the entire herd. About two weeks before freshening each cow is put in a box-stall, the only one on the ranch by the way, and fed succulent feed, when that is available, together with a ration of dried beet pulp and cocoanut meal. The object is to get the cows in as good flesh as possible because, as Bohnett Bros. say, "It can all be milked off after she freshens." Besides feed, and the capacity of the cows to produce, shelter is given credit for the high average fat yield of 300 pounds per cow last year. With the cheap feeding-shed already described, there has been no noticeable falling off in milk flow with any of the cows this winter, although there was during the winter of 1915-16; and on that account Bohnett Bros. expect an average production for their herd of 375 to 400 pounds of fat during 1917.

Organization of the Sacramento County Farm Bureau has been completed and Carl Williams assumed office February 1 as Farm Adviser.

Imperial Valley Cantaloupe Growing.

[Written for Pacific Rural Press.]

Cantaloupe planting in Imperial valley is progressing late in January. Cold weather has delayed planting somewhat, for the seed often rots when planted in cold ground. Wide rounded ridges about eight feet from center to center have been made in most cases with narrow furrows between. The seed is planted half way up one side of each of these. This puts the roots close to irrigation but keeps the plants out of it largely, and spreads them out to sun and air.

Alfalfa ground is selected whenever possible according to M. Manoogian, who had charge of 160 acres of cantaloupes last season for one company. It is first plowed three or four inches deep, then about a month later is plowed seven or eight inches deep. The "hard" finely divided "gumbo" soil may produce larger crops if properly worked; but the "soft" land in which more or less sand makes it more loamy and warm, produces the earliest. Cantaloupes do not thrive in alkali.

Several varieties are grown. Early Waters is usually planted first, but would mature first if planted at the same time as the others. On account of its egg shape, it is not popular on the market and not so many are now grown as formerly. The Rockyford Pollock, Yellow Pink, and Greenflesh all mature about the same time and are the standard varieties here.

On the early plantings, some of which are put in late in Dec. and early in Jan., a pointed cap of oiled paper is placed over each hill as it is

planted by hand to hold the warmth of the ground and protect the seedling plants from frost. Later plantings are done by machine and not covered with the papers.

The cantaloupes are irrigated according to soil conditions. The ground must not be dried very deep. In hot weather it dries enough to walk on in a day. Water is not allowed to cover the seeds or get around the plant stems. During picking especially, water is applied every three or four days, the pickers walking on the ridges when the furrows are wet.

Three or four cultivations are all that can be given on account of vine growth. There are no troubles according to Mr. Manoogian, except aphids. One grower lost 260 acres on account of this pest a year or two ago. While the State Insectary has furnished billions of ladybirds to control aphids, Mr. Manoogian burns the plants on and all around an infected area as soon as it is discovered, usually during picking time.

There has been a conflict of interest in regard to the proper maturity for picking; but it is quite likely that the rule established last season by most of the companies in connection with County Horticultural Commissioner F. W. Waite will be adhered to. The netting on the melons should be rounded, even up to the stem end, and the melon should pull loose without leaving any slivers of the stem on the melon. This system worked much to the satisfaction of the markets last year.

add a lot of humus to the ground by disking it up in the fall, whereas the corn would use up humus and other fertilizing elements. Another thing beans will produce is nitrogen, the most expensive and valuable fertilizing element and by far the most necessary element needed in growing rhubarb.

My plan is to grow the beans in the summer and disk it up in the fall, say early in September, using a one-horse disk.

I hope your correspondent will be able to get something of value to him out of this letter. You may send it to him if you like.

Covina.

Intercropping for Rhubarb.

To the Editor: I notice in your last week's issue, in the Queries and Answers department, under the heading "Rhubarb in Stanislaus," a question and answer in regard to growing Giant Crimson Winter Rhubarb in Stanislaus county.

While we need no shade here for rhubarb in summer, and our summers are just as long and dry as they are in Stanislaus county, I believe it gets hotter there than it does here, although we are 40 miles from the coast. Consequently some shade, such as he suggests from corn, would doubtless help carry it through the summer. In Florida, where it has always been found impossible to carry it through the hot, rainy summers, as it would invariably die down in the summer, the man who has done the most with it there writes me that by using plenty of shade in the summer a good deal of it will live through.

I think that a plan that I intend to adopt might very likely help him out if he adopted it. It is to grow blackeye beans or cow peas between the rhubarb rows in the summer. It is not to protect the plants from the sun that I am going to adopt it, as I have no such trouble, but solely for its fertilizing value, especially the humus that it will produce; but in his case, while it would probably not shade the plants any it would shade the ground and help to keep it moist if he kept it irrigated, and also keep the ground cool, and this ought to be a very material help in keeping the

sun from injuring the plants, I should think. I think it might do even more good than the corn as the corn would not cover the ground and would dry it out a great deal more. And in addition, the beans would

Costs of Producing Cotton.

[Written for Pacific Rural Press.]

Two kinds of cotton are grown in Imperial Valley. Most of it is "short staple" (Mebane) with fiber about 1 1-16 inches long and selling at this writing about 16 to 18 cents a pound. The rest is "long staple" (Durango) with fibers about 1 3-16 inches long and selling about 27 to 29 cents a pound. Why any of the low-priced short staple should be grown is told by one of the growers, who proposes to enlarge his acreage next year; but to sell it through the long-staple growers' co-operative association. He says that it yields a little more, matures earlier, the bolls are larger, having a larger proportion with fine "locks," stands water shortage better, and has a larger proportion of lint to seed. Among the reasons ascribed by long-staple growers are that most of the cotton growers are from Southern States, where they have been imbued with the idea that long-staple won't grow inland. They admit that pure Mebane seed would probably out-yield the Durango slightly, but such pure seed is said not to be available and it is hard to understand why the high-priced cotton should not be almost exclusively grown. On E. Gannon's ranch in the western part of the Valley are several fields of both kinds in which the Durango is yielding much the heavier. On the other hand, Lee Bengé points to his short-staple crop from carefully selected seed, of 38 bales from 35 acres this year. Houghton and Simpson, who grow only Durango with equally careful culture, are harvesting a crop estimated at about a bale per acre from 80 acres. One of their fields which suffered for water and was therefore picked first was estimated at 0.91 bales when all but the unopened bolls had been picked, while another was yielding 1 1-3 bales per acre.

Cost of Production.—The testimony of many is that the cost of production is practically the same for both kinds, except in picking. Houghton and Simpson, young men whom their banker recommends as "making good by head work and hand work, steady on the job all the time," and who have grown three crops by careful methods, give the following estimates of the costs of production as based on their experience. Other growers omit some of the items, such as plowing, and some of the cultivation and water, but their yields generally show more than proportionally less.

Where cotton has been grown the past season, the stalks are cut up with a regular stalk-cutter in the winter at a cost of \$.75 to \$1.00 per acre, depending on their size and number. This includes clearing away such stalks as cannot be well worked into the soil with a disk. The disking costs \$1 to \$1.25 per acre. The ground is always plowed and harrowed by these men at a cost of \$2.50 to \$3.00 per acre. It is then listed to make ridges where the furrows were the previous year, for \$1 per acre. Planting costs about \$1 and the seed \$.75 to \$1. Three cultivations are charged \$3 and chopping (thinning with heavy hoes) costs \$1 to \$1.50, depending on thickness of planting, etc. Water

costs \$1.75 to \$2 per acre per season at \$1 per cubic foot per second for 24 hours. Labor of attending the water is placed at \$2 per acre, and taxes and assessments for maintenance of ditches are \$3 to \$5 per acre according to the season and district and condition ditches are put into. Picking cost \$.90 to \$1.10 per cwt. of "seed cotton" as it comes from the field last year, but it cost \$1.25 to \$1.50 this year. At a bale per acre, the picking cost \$20 to \$24 per acre. Mr. Bengé got pickers at \$1 to \$1.25 this year for his short staple, on account of the larger bolls. Houghton and Simpson, who haul about three bales of seed cotton per load, 4 1/2 miles to the gin, charge up \$1.50 to \$2.00 per bale for hauling. Ginning costs \$4.50 per bale for either long or short staple, including bagging and tying.

The totals thus estimated, and not including rent or interest on investment or cost of leveling, is \$43.75 to \$52.25. A bale of lint at 27 cents sells for \$135 and the seed from it sells for \$22. Mr. Smith, who grew 85 acres on the Gannon place, averaging nearly a bale per acre in spite of a seriously poor stand in some fields and an over-thick stand in others, sold his crop on the stalks for \$5,500. The seed, of which there is more than twice as much weight as of lint in the cotton as it comes from the field, is now selling at two cents per pound. Thus it just about pays for the picking, and gins buy it without further effort on the part of the grower.

Turlock business men are entering a protest against the purchase of permanent county fair grounds at Modesto on the grounds that the county fair should be held in a different town each year.

Shipments of hay from the Patterson district of Stanislaus county for 1916 greatly exceeded those of 1915.

ALPHA Automatic High Pressure POWER SPRAYERS

**Drive the Solution into the Trees
Under a Uniform Heavy Pressure**

The satisfactory results obtained with either The Alpha Triplex or Alpha Duplex outfits are due primarily to the following unquestionable superior features of Alpha Sprayers:

THE AUTOMATIC PRESSURE GOVERNOR

Which insures safety, secures uniform pressure, and eliminates unnecessary wear and strain on both pump and engine. No troublesome relief valves or diaphragm pressure regulators are required on Alpha Sprayers. No liquid is pumped except it is forced through the nozzles.

THE PERFECT POWER PLANT

The Alpha Gasoline and Distillate Engine, which is directly geared to the pump, is a thoroughly first-class machine. Built to stand up under continuous full load. Equipped with built-in, gear-driven magneto. No batteries required. Starts on the magneto without cranking.

You can equip the power sprayer you now have with an up-to-date reliable Alpha Engine. Write us for Special Engine catalog.

How to Treat Grain for Smut.

To the Editor: Smut seems to be in most of the grain that was grown here this last season, regardless of bluestoning. Is there any other way of treating wheat or barley that would give better results?—F. H. Robinson, Neenoch, Cal.
[Answered by Prof. John W. Gilmore, Univ. of Cal., Berkeley.]

If the seed wheat referred to in the communication was thoroughly treated, I do not understand why the treatment should not have been more effective than it was, except on the ground that the soil in which the seed was planted was already thoroughly infested with smut. If such were the case no treatment of the seed would be thoroughly effective. Then, too, there are two different kinds of smut, commonly called Loose smut, and Stinking smut; the former not being affected by any known means of treatment. Sometimes a quantity of seed may also contain the balls or pods of the

Stinking smut, and these are not readily affected by treatment, and if not, may carry the disease into the planted crop.

Aside from the treatment of seed wheat with copper sulphate, two other methods are sometimes employed, though it is generally considered for wheat that the copper sulphate method is the better and more easily applied. The next most effective remedy seems to be in the treatment of the seed with formalin, as follows: Make a solution of one pound of formalin to about forty gallons of water, soak the seed in this solution until each grain is thoroughly wet. This may be accomplished by having the solution in a barrel and churning, or agitating, the grain in a bag until each grain is thoroughly wet. The grain may then be spread out in the shade to dry. Sometimes this treatment is modified by sprinkling the solution over a pile of seed wheat and afterwards shoveling the mass over several times until each grain is thoroughly wet.

A third method that is sometimes employed, though with some risk because the germ of the wheat seed is exposed, is the hot water treatment. The wheat is dipped into a receptacle containing water heated to a temperature of about 130 degrees. In performing this treatment one must be very careful that the grain does not stay in the water too long, and also considerable care is required in keeping the water up to the required temperature. The grain should not be allowed to remain in the hot water more than five minutes. This method of treatment is much better for such seeds as barley and oats which are enclosed in their glumes.

COVERING TOMATO PLANTS FROM FROST.

[Written for Pacific Rural Press.]

Take a hoe and cover young tomato plants with soil. This cover can be left on two nights without injury to the plants. If it turns cold after dark just take a lantern and hoe and the job can be done in a few minutes and you do not have to hunt for paper, cans, sacks, boxes, hay or any other old thing to cover them with.

W. T. Jones.

Shawmut.

About 50,000 acres of cotton were grown in Imperial Valley on the Mexican side last year, and about 43,000 on the American side according to F. W. Waite. In 1915 the figures were 30,000 and 15,000 respectively, yielding 43,000 ginned bales. Picking of the 1916 crop is still under way.

Potato seed balls have recently been furnished the University of California by Andrew Wyatt of Auburn, who was a contestant in a potato-growing contest last year. The University intends trying out the seed in the hope of securing an improved variety.

From present indications of activity in rice land deals in Glenn county, predictions are being made about 17,000 acres will be planted to that crop in that county in 1917.

TALKS ON Nitrogenous Fertilization

Number 8

IT is a fact that California soils respond promptly and generously to intelligent fertilization. This is particularly true concerning nitrogen, in which important plant-food element so many soils are deficient. But as is always the case, some forms of nitrogen are better than others.

SULPHATE OF AMMONIA

Sulphate of Ammonia, because it is in the form of a sulphate, gives particularly good results on California soils, not only because of the nitrogen it supplies, but because it aids in bringing the soil into good mechanical condition.

It benefits *all* crops, in the orchard, garden and field.

How I Grew My Crop of Potatoes.

[By Sherwood Beckman in San Joaquin Farm Bureau Monthly.]

I selected a plot of ground, a rich, sandy loam, in the Lodi district, 29 1/2 by 147 feet, which had been in alfalfa a number of years.

The last year's crop harvested being a crop of beans, left the ground in fine shape for a volunteer crop of clover. This I plowed under, nine inches deep, on February 1st.

On February 8th the plot was harrowed; the ground was in an ideal condition for the forming of a good seed bed.

March 8th I received my shipment of certified seed potatoes from Carl Nielsen, Sebastopol. These potatoes were of the British Queen variety.

March 11th I cut my potatoes, plowed the ground and planted them, about four inches deep, the rows being three feet apart and the hills 15 inches in the rows.

April 1st I harrowed my ground, which left it in a pulverized condition. Immediately following the potatoes began to come up, giving an even stand.

I cultivated for the first time on April 15th, working the ground about five inches deep. The same day I raked between the hills to kill all the small weeds which had started.

On May 6th I irrigated, as the ground was becoming dry.

Following this irrigation on May 9th the potatoes were hilled with a cultivator, which had a hilling shear attached to the rear standard.

On May 14th this was repeated.

The hilling was done to encourage the setting on of the tubers.

I thought it necessary to irrigate them again on May 20th.

By May 24th the ground was dry enough to hill again.

This was done to form a mulch and prevent the loss of moisture through the baking of the ground.

Again on July 3rd I irrigated. By this time the vines were large enough to entirely shade the ground.

I could not cultivate on account of the tubers being so near the surface. No cultivation required frequent irrigation in order to provide a continuous moisture supply.

On June 19th I irrigated, and again on June 27th. Immediately following the last irrigation I mulched with straw to conserve sufficient moisture without injuring the quality of the potatoes. This was done as an experiment on my part,

which proved very satisfactory.

July 29th I harvested my potato crop, with the aid of several club members and our club instructor, the yield being 2894 pounds of potatoes.

MAKING GOOD FOXTAIL HAY.

To the Editor: In regard to one of your subscribers' query as to cutting foxtail for hay, will say that I have had about thirty years' experience in cutting foxtail for hay near Hanford. If he will cut it when it is just starting to head out he will find that it will make better hay for dairy cows than alfalfa hay, for they will give more milk on it. Horses will also do well on it. After it gets riper it is nearly worthless. But he must be careful in curing it as it heats easily and I have known stacks of it to burn when put up too green.

F. McClellan.

Reedley.

UNCLE SAM'S FARM CREDIT COLUMN.

[Compiled for Pacific Rural Press from U. S. Dept. of Agr. valuations.]

All farm products during 1916	\$13,449,000,000
All field crops	9,111,000,000
Animal products	4,338,000,000

Special Crops:

Corn	\$2,296,000,000	Potatoes	417,000,000
Cotton	1,146,000,000	Wood lot	221,000,000
Hay	1,162,000,000	Apples	186,000,000
Wheat	1,026,000,000	Tobacco	169,000,000
Oats	656,000,000	Barley	160,000,000

The gross value of farm crops and animal products for 1916 exceeds by \$2,674,000,000 the total of 1915, the previous record, and more than three and a half billion dollars the value in 1914. Crop production for the year did not reach record quantity figures except in a few minor instances, but high prices sent total values up. The level of prices paid to producers for the principal crops on December 1, 1916, was about 55.9 per cent higher than a year previous; 52.9 per cent higher than two years before and 52.8 per cent higher than the average of the previous eight years on December 1.

NOW is the Time to Fertilize Fruit Trees

The rains will dissolve the plant food and take it down to the roots. The well-fed trees will bear and mature **BIGGER CROPS OF BETTER FRUIT.**

Fertilizing is not an expense, but an investment, yielding large and immediate returns.

MOVING AN OLD ARAUCARIA.

[Written for Pacific Rural Press by John McLaren, Supt. Golden Gate Park.]

In reply to a correspondent of yours whose question you send me, I beg to state that if I were moving an Araucaria Imbricata, fifteen feet high, I should dig a trench along the entire ball four feet deep, two feet wide and six feet from the stem of the tree, in other words a ball twelve feet square. I would then make a box of two-inch planks surrounding the whole ball, three inches larger than the ball. The roots should be cut with a sharp instrument so that they would not be bruised but show a clean cut. Between the ball and the box fill in with rich, light soil; outside the box should be filled with soil to its original level and thoroughly watered. Keep the tree boxed as above for six months, watering frequently.

After the six months have expired, the fresh soil put in will no doubt be filled with a myriad of feeding roots. When this time is up dig down around the outside of the box and undermine the same, cutting the tap and bottom roots, fastening the back of the box to the sides with strong nails. After the bottom is on the box put two strong six by eight timbers under the box, raise with jack screws to the level of the ground. To all four sides of the box should be nailed timbers two by six, the full height of the tree. These should be placed so as to form a strong framework and the stem of the tree tied to the framework, so that the tree will not shake backwards and forwards when moving to the permanent site. The tree should be carefully watered and attended to by experienced men for at least two years.

TIME TO PLANT AND GRADE POTATOES.

To the Editor: I have about four acres of made land, a sandy loam, and would like to know the best time and the best grade of potatoes to plant.—D. H., Princeton.

[Answered by W. V. Shear, Potato Specialist, Stockton.]

As to the best time to plant potatoes: in spring plant from three to four weeks before the last heavy frost is expected. Potato plants are fairly hardy but will not withstand heavy frost, and since it takes about three weeks for the plants to appear above ground after planting, you can decide in this general way about the earliest date it is safe to plant. As to the best "grade" to plant, if this means "quality," get the best possible, which will be none too good; if it means "variety," the writer doubtless refers to early potatoes, and the standard early varieties are Triumph, Early Rose, and Early Ohio, for red potatoes; Cobblers, American Wonder, White Rose, and Green Mountain for medium early white potatoes.

Ranchers of San Diego county report a good year for 1916. It marketed 450,000 boxes of lemons; 150,000 boxes of oranges; 10,000 boxes of grapefruit; 3,000,000 pounds of olives; 50,000 bushels of apples; 17,500,000 pounds of grapes; its hay and forage crop is said to have been worth \$1,000,000 and its vegetables and nuts \$2,000,000 more.

JOHN DEERE IMPLEMENTS

John Deere Plows for Light Tractors

The John Deere Light Tractor Disc Plow works with any standard tractor—the hitch is adjustable.

Three or four discs. Discs have a double setting. Taking care of all conditions where a disc plow can be expected to operate.

Adjustable scrapers keep discs clean and lighten the draft. No choking in trashy ground—frame is high, beams are dropped, which gives good clearance under the frame, and there is plenty of room between the discs for trash to pass through.

So far as quality of John Deere Plows for Light Tractors is concerned, they are built for the farmer who realizes that it is business judgment to buy a high grade tractor plow. Don't forget that a tractor plow is not an everyday purchase.

John Deere Plows for Light Tractors are noted for their high grade work in the field—the real test of tractor plow value.

Before you make your purchase, be sure to see John Deere Plows for Light Tractors. A careful purchase means a permanent saving.

BOOK FREE 156 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars.

Describes and illustrates Plows for Tractors; Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain

Wagons; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders; Stackers; Rakes; Mowers and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills; Seeders; Grain and Corn Binders.

This book will be sent free to everyone stating what implements he is interested in and asking for Package No. X-162.

JOHN DEERE, MOLINE, ILL.

John Deere Combined Cotton and Corn Planters

Cotton seed cannot choke up in the hopper—a cotton picker wheel prevents it.

John Deere **OB-LIQUE SELECTION, HORIZONTAL CELL DELIVERY SEED PLATE** for corn—an accurate drop.

Positive gear drive with dirt-proof gear case.

Special shaped shovel with reversible points opens furrow and pulverizes the soil without throwing it up on the face of the shovel. Soil falls behind and covers the seed.

Adjustable press wheel can be furnished. No lever used on this press wheel.

Depth of planting can be regulated with the foot while planter is in motion.

tested out through years of satisfactory field use. A cotton picker wheel extends through the bottom of the hopper. This wheel revolves in one direction and the cotton spider in the other—separating the seed without damaging it. Change in quantity is made by turning a thumb nut on the hopper.

Hoppers are beaded. Seed plates fit perfectly. All the seed in the hopper is planted. Peanut plates or a special hopper can be furnished for planting shelled or unshelled peanuts.

John Deere Model "B" Disc Harrow

The Model "B" pulverizes at even depth its entire width.

Patented spring pressure third lever—inner ends of gangs can be given light or heavy pressure to disc over ridges or cut out dead furrows without burying the harrow.

Independent gangs. All tendency of gangs to crowd to one side is easily overcome by giving them the proper relative angle.

Flexible—only that part of the Model "B" harrow passing over an obstruction is lifted out of the ground.

Rear section can be furnished to make a double action harrow.

Using a disc harrow before plowing pulverizes surface lumps, works trash into the seed bed and prevents the escape of moisture. Then when the furrow slice is turned, the trash decays rapidly and no large air spaces are left between bottom of furrow and the turned furrow slice. Water in the subsoil can make its way into the seed bed and plant roots can penetrate to deeper soils.

Discing after plowing removes the weeds, and makes the seed bed compact, but not hard. The discs break up lumps of soil.

John Deere Syracuse Plows

Syracuse Plows have an enviable field record among farmers in chilled or combination plow territory.

Here is a feature that is appreciated by the man who buys a Syracuse Plow. Extras ordered will be duplicates of the original parts. Bolt holes will be in the right place. Every part will fit. In fact all necessary parts that go into a Syracuse Plow could be ordered as repairs and when received built into a complete plow. Extra parts are exact duplicates—no trouble results.

Remember, Syracuse quality is uniform.

Share and shin piece combined—a fresh, clean cutting edge obtained with each new share.

Index or set-over style of beam—easily shifted to give the plow more or less land.

Equipped with Syracuse Chilled Moldboards—tested for satisfactory scuring qualities, strength and uniformity. Right and left hand styles.

John Deere-Syracuse Sloping Landside Chilled Plow

John Deere Spreader

The Spreader with the Beater on the Axle

Mounting the beater on the axle simplified the construction, eliminated troublesome parts, and made possible a successful low-down spreader with big drive wheels. There are no shafts to get out of line, no chains to cause trouble, and no clutches to adjust. The only spreader with beater and beater drive mounted on axle.

Low down, with big drive wheels out of the way. Easy to load.

Revolving rake, driven by manure moving toward the beater—no bunching of manure. Ball bearing eccentric apron drive—a new and exclusive driving device. Makes uniform spreading certain.

Wide spread attachment for spreading seven feet wide can be furnished for the John Deere Spreader. No chains nor gears. Quickly removed.

THE JOHN DEERE TRADE MARK

To designate and brand their goods, "Deere & Company," use the "leaping deer" trade mark. It is the best known implement trade mark in the world.

The reason that it is so well known is because of the high quality of the implements themselves.

Prestige in farm implements is obtained solely through the superior merits of the goods.

The permanent prestige of John Deere implements has been maintained by the company's strict adherence to prin-

ciples of manufacture that originally made the goods popular.

The "leaping deer" trade mark is Deere & Company's stamp of approval. It distinguishes John Deere Implements from inferior goods. It means that the implement was made in a John Deere factory, in the John Deere way. It is a guarantee of satisfaction and an insurance policy against disappointment.

Look for the John Deere trade mark when you buy.

JOHN DEERE, MOLINE, ILLINOIS

General Agricultural Review.

FIELD CROPS.

Plans are being laid for the formation of a garden truck growers' marketing association at Riverside.

Dealers at Stockton now estimate that there will be 10,000 acres of onions planted in San Joaquin county this season. About 50 per cent of the crop has already been planted.

C. H. Utting, irrigation engineer of Blythe, says that it now looks probable that the cotton acreage in the Palo Verde Valley of 8,000 acres during 1916 may be trebled the coming season.

According to Frank Shipley, manager of the California Lima Bean Growers' Association, only 32 members out of a total membership of 435 growers have given notice of intention to withdraw.

Frank Hasper and J. M. Tigner of Imperial county had Peruvian alfalfa half knee deep when seen Jan. 24 by our staff writer. This in spite of the "unusually" severe cold weather of the past week.

Encouraging reports come from Butte and Sutter counties as to the rice situation. Buyers have been in the field at the latter place offering \$1.80 to \$1.85. Farmers in the Biggs district are said to be holding for \$1.85 to \$1.90.

The N. H. Locke Co. of San Joaquin county have recently shipped the last of their 1916 crop of potatoes. A report from Stockton says that these are among the best potatoes that have arrived there the past season.

Ray Henderson of Imperial county, who has grown ten acres of asparagus for about eight years, plans to put 20 acres of alfalfa into asparagus this year and later have the whole 80 acres in this one crop. Asparagus here is marketed from Feb. 1 into May.

The acreage of long-staple cotton in Imperial Valley in 1916 was six hundred per cent that of 1915, according to Argyle McLachlan of the Imperial Valley Long Staple Cotton Growers' Association. The short staple acreage increased only 50 per cent.

It is announced from Oxnard that local bodies of the California Lima Bean Growers' Association throughout the country are holding meetings for the discussion of the work during the past year. The total payments of the association to date for beans marketed reaches \$2,000,000.

DECIDUOUS FRUITS.

The valuation of all fruit harvested in Kings county during 1917, as reported by County Horticultural Commissioner Fred K. Howard, was slightly over \$3,000,000.

Canners are said to be making contracts in Sutter county for a large acreage of peaches, prices being \$25 to \$27.50 per ton for choice fruit, some getting a bonus of \$5 a ton for the 1917 crop.

Carl Ley, Horticultural Commissioner of Glenn county, has resigned that office to assume management of the Lowenstein ranch, 160 acres of which will be planted to prunes, almonds, and olives this season.

During 1916 the Colfax Fruit Growers' Association increased its business 100 per cent over that of 1915, according to the figures recently submitted at the annual meeting of that organization.

In order to increase the membership of the California Peach Growers, Inc., in the vicinity of Hanford a Peach Day will be set at an early date, at which time the entire district will be canvassed for new members.

Farmers in the Terra Bella district of Tulare county, who intended planting a large acreage to Calimyrna figs this season, have been compelled to delay planting for a

year because of a shortage of nursery stock according to reports from that section.

Reports from San Luis Obispo county say that when the present season's tree planting is finished there will be approximately 6,000 acres of fruit in the San Miguel, Templeton, Atascadero, and Paso Robles districts, most of which are almonds.

CITRUS, SEMI-TROPICAL.

Orange packers of Porterville have gone on record as favoring the adoption of the fruit standardization law now before the legislature.

Alexander Elliott is planting 100 acres of olives in the vicinity of Oroville. A pumping plant to furnish irrigation water has already been installed.

It is announced from Santa Ana that between 50 and 60 cars of navel oranges are still to be shipped from the nine associations affiliated with the Orange County Fruit Exchange.

A dispatch from Porterville states that from experiments already conducted it is believed that the June drop of oranges in Tulare county is due to a fungous growth which may be controlled by spraying.

G. H. Hecke, State Horticultural Commissioner, announces that the insectary division of his department has received a promising new parasite of the Baker mealy bug from China.

As a result of the recent decision of the Attorney General, frosted fruit will not be allowed to be sold in the future. County horticultural commissioners are allowed to confiscate such fruit, according to the decision.

W. J. Arkell, vice-president and general manager of the George Washington Instantaneous Coffee Co. of Los Angeles proposes to manufacture a soluble lemon and orange powder to be made of the juice of cull oranges and lemons and to be retailed in boxes like cocoa and coffee.

A shipment of 25 cars of oranges was shipped by boat from Los Angeles to Puget Sound recently, which is the largest water shipment made this season. Icing is unnecessary with these shipments and transpor-

tation charges are much lower than they would be by rail.

The State Horticultural Commissioner has recently issued an order pertaining to the importation of orange seed into California. Florida will be the chief source of supply for this seed and intending purchasers should consult the authorities as to the regulations in force.

Report has it that the orange trees in Redlands are infested with scale and that G. S. Hinkley has made arrangements with the county for the fumigation of all the trees in that city.

What are said to be the oldest olive trees in the State are located at the University of Santa Clara. The trees, which are 105 years old, are bearing a heavy crop this year and are said to be in a good, vigorous condition.

The Orange Heights Citrus Association of Corona is considering the formation of a co-operative fumigating association modeled after the Growers' Fumigating Supply Co. of Pomona. A committee made up of C. T. Briggs, J. H. Moore, and L. A. Fink has the matter in charge.

Reports from Riverside say that after a thorough investigation of the qualities of lemon juice, manufactured by a patented process, the board of directors of the Chamber of Commerce has endorsed a plan for the establishment of a plant in that city for its manufacture.

Oxnard wants a branch of the California Fruit Exchange. Last week B. B. Pratt, field man for the Exchange, talked to a meeting along this line, and a committee, of which Chas. Donlon is chairman, was named to look into the matter and report at a later meeting.

AVOCADOS

Only Guatemala Hard-Shell Avocado trees in California, grown from imported buds. These buds were selected, imported and propagated by me after having lived for thirty years in the Tropics. Booklet sent on application.

Trees in BLASTED soil bear better

Fruit growers have proved—by planting some trees in blasted beds and others in ordinary ground—that trees planted after the use of explosives root deeper, grow faster and better—that they are thriftier in every way, bear earlier, and yield larger crops.

They have proved also that when the soil of established orchards is properly blasted the trees immediately take on new vigor and bear better fruit thereafter. Orchardists know that this condition is due to the increased moisture-storage capacity induced by blasting and to the consequent release of plant food from the subsoil.

Fruit growers in every Pacific Coast State have used tons of

GIANT FARM POWDERS STUMPING — AGRICULTURAL

CALIFORNIA Fruit Growers say:

"The O'Connor prune orchard near Los Gatos was blasted in 1913. Its largest crop had been 3,900 pounds. After the blasting it yielded 8,000 pounds in a dry year. The prunes were much larger and the trees made a better growth than the orchards on either side." JOHN A. GALPIN, Los Angeles.

"Trees planted in blasted holes, even in fertile soil, do far better and are harder than those planted in dug holes. The powder sent us by the Giant Powder Company is the most satisfactory I have had." JOHN ZURR, Santa Rosa.

"If I were planting trees even in light soil I should prepare all the holes with powder. Trees so planted make extraordinary growth." FRANK FEMMONS, Oakhurst.

"We advocate the use of explosives for loosening up compact soils and hardpan in tree planting, knowing the value of such work." FANCHER CREEK NURSERIES, Fresno.

"Trees should have a deep soil. Even where there are continuous depths of dense strata, and not shallow hardpan underlain by free soils, trees can often be successfully grown by the use of high explosives." PROF. E. J. WICKSON, Los Angeles.

"Where labor is high priced blasting proves the cheapest as well as the best way to prepare ground for tree planting. If properly proportioned the charge will throw out sufficient earth to plant the tree without further digging. It has often been found that the loosening begun by the powder has extended through the mass of land so as to permit the roots to utilize it fully and even to permit of the planting of field crops where formerly they would not succeed." PROF. HILGARD, Berkeley.

"Trees planted in blasted soil do much better." ROBERT DUNN, Ventura.

"There are many acres in this state that can be transformed from non-profitable to very productive land by blasting." JOHN VALLANCE, Oakland.

"Where we have used powder in soils of a refractory nature, the growth of trees has exceeded the growth of the same varieties planted where the holes were not blasted, by not less than 25 per cent." HOWARD & SMITH, Los Angeles.

for planting trees and deep-tilling their orchards. These powders are made in two brands, Eureka Stumping Powder and Giant Stumping Powder, and are prepared especially for farm work. They are more effective and do their

Eureka Stumping Powder pulverizes the soil instead of caking and packing or throwing it high in the air. This is the action that is wanted in stump and soil work, and the action that the so-called "high strength" dynamites will not give. When you use Eureka Stumping Powder the finished job costs you less money.

Giant Stumping Powder, which is also used for subsoil blasting, is the most efficient explosive for many other kinds of farm work, including blasting dead trees or stumps in wet soil.

Make this test of Giant Powders

By using the Giant Farm Powders you can demonstrate their superiority for tree planting and orchard tillage. Fill out the trial order blank in the coupon to the right. We will have our nearest distributor supply you—at lowest market price—with a 25- or 50-pound case of either of the Giant Farm Powders. Test this in comparison with any dynamite. The results will show you why fruit growers in every section insist upon having the Giant Farm Powders for orchard tillage work.

Giant Farm Powders and other Giant blasting supplies are sold by distributors everywhere. Your own dealer has them or can get them for you. If he offers you a substitute, write us and we will see that you are supplied with the genuine. Giant Powder is the trade name of explosives manufactured by The Giant Powder Co., Con. Because Giant Powders are best known everywhere, many have assumed that all high explosives are Giant Powders. Insist upon having the genuine.

PURE WATER IN IMPERIAL VALLEY DAIRY.

[Written for Pacific Rural Press.]

One of the landmarks of Imperial Valley, and at the same time probably the best cheap way of obtaining pure cool water on a large scale, is the outfit on the ranch of W. L. Hodges.

Water is run from the ditch into a pond as usual, except that it flows through a box-flume which extends several feet out toward the center of the pond. This flume is screened at the ditch end.

A few feet from the edge of another side of the pond are four big corrugated iron tanks about 10 feet deep, resting about 30 feet high on a frame of 8x8's braced with 2x10's.

Under the tanks is a gas engine of about 10 h.p. which runs a line shaft about eight feet from its center. The line shaft runs a two-inch centrifugal pump by a long belt; for the pump is located out over the water. This forces water through a pipe into the nearest tank.

From a point seven feet up on the first tank on the side nearest to the second tank, a pipe connects the two, leaving about seven feet of water permanently in the first tank. From the second to the third is a pipe about 4½ feet above the floor, and the third is connected to the fourth at two feet high. All water is taken from the last tank, after it has thus settled by degrees, not having been entirely clear when pumped from the pond. An ample opening in the bottom of each tank permits easy cleaning at any time. The result is eminently satisfactory, providing clear water for house and dairy use.

The lineshaft also runs other machinery including a feed grinder set on concrete under the tank. Mr. Hodges grinds everything he feeds except to the stock hogs, which also receive much ground feed. On this place last spring were kept over 500 hogs and about 100 dairy cows over two years old. These included many purebred Holsteins and Durocs.

ENGINE IRRIGATES AND CHOPS FEED FOR COWS.

[Written for Pacific Rural Press.]

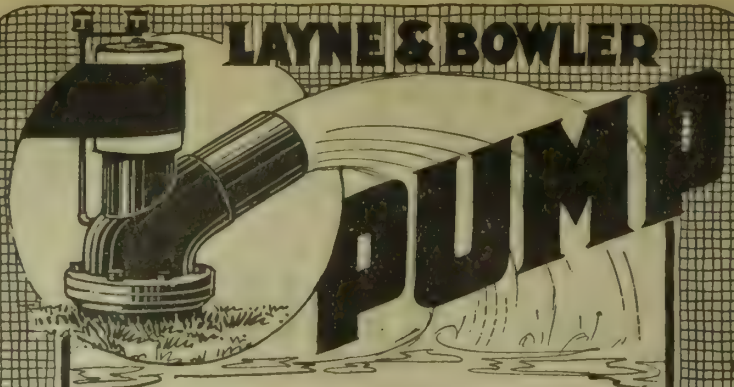

An engine and feed chopper saves hay and corn on S. J. Smith's dairy farm in Stanislaus county. He has them mounted on a frame of 6x6's twelve feet long with an extension for the cutter to rest on to get greater belt length which helps avoid slippage. Four wheels on the frame make it easy to haul around. The barley-alfalfa-foxtail mixture that comprises the first crop of alfalfa, is chopped and blown into the barn, whence it is taken for the cows and dampened before feeding. All the alfalfa is chopped. Mr. Smith fed a few loads recently without chopping, and there was a lot of waste; though with chopped alfalfa the cows eat it all.

Some Egyptian corn was cut and put into the 36-foot silo, but "never again." There was lots of grain on it, but the stalks seemed not much good. Perhaps this was for lack of

plenty of water used while filling. About 40 pounds of gyp silage was fed per day with about 10 pounds cut alfalfa hay. When he quit feeding this and gave plenty of alfalfa alone the milk yield doubled. The corn had been cut when many seeds were thoroughly ripe, and the stalks pretty dry. A lot of it molded. Indian corn and first-cutting alfalfa and barley are to be used hereafter.

The 6 h.p. engine and 10-inch cutter chop two big loads of alfalfa hay per hour, according to Mr. Smith; and six gallons of gasoline runs the outfit for a 10-hour day. Distillate is to be used hereafter because it gives more "kick" and more power per gallon. The engine starts on batteries and is then switched over to a generator run by a fly wheel.

Part of the ranch is too high to irrigate from the ditch. For this the engine will be hitched to a four-inch pump to lift the water out of a sump to be made. This is to irrigate barley and corn.

LAYNE & BOWLER

PUMP

Preferred by Up-to-Date Irrigators

Because of the perfect service Layne & Bowler Pumps are capable of rendering even when operating under the most trying circumstances, the leading irrigators in the West have selected them in preference to all other makes. Years of successful experience in pump manufacture are embodied in Layne & Bowler Pumps. They are as perfect as human ingenuity can make them. Remarkably simple in construction—nothing to get out of order. Easily operated.

Our free Pump Catalog should be in the hands of every rancher. Write for your copy. Ask for Booklet No. 25.

Layne & Bowler Corporation

confidence

For many years the building of gold dredges was the principal business of The Yuba Construction Company.

We have built not only the largest gold dredges in the world but we have built more large dredges than any other manufacturer. During 1916 we have constructed and launched two \$470,000 dredges and are now working on an order for a third. In no machine is the cost of a shut-down greater than in a gold dredge; in no machine is the wear so great. Yuba dredges have achieved a world-wide reputation for low working cost and a minimum amount of time lost.

Another part of the Yuba business has been devoted to the manufacture of Yuba Pumps.

So successful were we in building a pump especially suited for very difficult conditions on a gold dredge that we very soon found a growing demand for an irrigation pump built with the same skill and intelligence. These have likewise established an enviable record.

Three years ago we began the manufacture of farm tractors.

We were not interested so much in building a cheap tractor as in building one that would operate cheaply. The astonishing performance of this machine has brought it instant success.

Then followed the Yuba plow—a fitting mate for the Yuba tractor.

These four products represent an ideal combination from the standpoint of manufacturing efficiency.

These products are sold all over the world.

Yuba dredges have produced millions of dollars of gold for their owners; Yuba tractors are working on farms, pulling Yuba plows, furnishing the power for Yuba pumps, performing many useful tasks from Alaska to Egypt.

These are the traditions, the foundations, which stand back of every Yuba tractor—the strong cable which holds this organization to its high accomplishment and establishes unswerving confidence in its products.

Write to us for detailed information about the Yuba best suited for your needs.

SIPHONING WELL WATER.

To the Editor: Will you please tell me if it is possible to siphon water from one well into another? We are using a deep-well plunger pump and draw the water down 70 feet from the surface. The water stands at about 16 feet from surface when the pump is not working. The well from which we wish to run the siphon is 25 feet from the well we are now using and the water level is not affected when pumping from the other well. If it is practical to use this siphon please state the size pipe required to carry 100 gallons per minute.—Subscriber.

[Answered by J. B. Davidson, Prof. of Agr. Engineering, Davis.]

It will be possible to siphon the water from one well to the other, but will be necessary to place the connecting pipe below the surface. It will not be practical to lift the water more than 10 feet over the hill between the two wells. Perhaps a flow could be secured with a higher rise, but such an installation would not be extremely practical. The flow between the wells would depend upon the difference of level in the two wells. If there is a difference of 10 feet in the level of the water in one well over the other, we have determined by consulting a table that you should expect a flow of 130 gallons

per minute in a two-inch pipe. The actual flow would be somewhat less than the flow in a straight pipe. Some provision should be made for exhausting the air at the top of the pipe so as to start the flow.

WET BATTERIES OR MAGNETO?

To the Editor: I am using two stationary gas engines, 3 h.p. and 6 h.p. respectively. Dry batteries have gotten to cost me more than fuel and oil, and if practicable and cheaper would like to install fluid batteries. Would you be so kind as to inform me how to install them, number of jars, size and material to fill them, where to procure them and the probable first cost and subsequent upkeep? Each engine requires 5 dry cells.—Subscriber, Hanford.

[Answered by Prof. J. B. Davidson, Univ. Farm, Davis.]

[Wet batteries can be substituted for dry batteries as a source of electric current for gas engine ignition. The two makes of batteries in more general use in this connection are the Edison and the Gordon. The 300 ampere-hour size is the size generally used. If the spark coil is not changed six cells will be used as the wet battery does not have the voltage that the dry battery has. Four cells can be used with a special coil. The voltage of a wet cell is considerably less than one volt.

We would suggest that you give consideration to the magneto as a source of electric current. Magnetos require no expense for maintenance and the best modern engines are all magneto-equipped.]

ENGINE NEEDED NEW COIL.

To the Editor: Last spring I wrote you in regard to my troubles with a gasoline engine that would slow down and miss and then start up again, taking fuel at each chug steady for a short time and giving very poor service. I had a number of so-called experts look at it but to no avail, so they condemned the engine.

The thought struck me that it might be the spark coil, so I took it to a garage and had it tested. It seemed to be all right but I suggested that the batteries the garage man was using were strong enough to wake the dead and to try four used dry cells. Then we found the trouble; the coil was not strong enough and would go for a while and then stick. I bought a guaranteed one for \$6 and with the exception of having a crooked spark plug my troubles have been easily found and adjusted in a few minutes.

Denair. Harry W. H. Daniels.

FIGURES ON A CEMENT SIDE-WALK.

To the Editor: How much cement would it take to make a walk 45 feet long and four feet wide, and how much sand would I have to mix with it?—Subscriber, Merced.

[Answered by J. B. Davidson, Prof. of Agr. Engineering, Davis.]

A cement walk of the above dimensions will contain 60 cubic feet. If a mixture of one part of cement, 2 of sand and 4 of screened gravel or broken stone be used, the following materials will be required: 14 sacks of cement; 1 yard of sand; 2 yards of stone. If a mixture of 1 part of cement, 2½ parts of sand, and 5 parts of screened gravel or broken stone is used, 12 sacks of cement, 1 yard of sand and 2½ yards of stone will be needed.

If a finished coat is applied to the top of a 1:2 mixture about 3 additional sacks are needed.

KILLEFER EFFICIENCY

KILLEFER QUALITY

We believe our 1917 model beet cultivator is the strongest tool of this kind made, and this strength is not accomplished by the use of heavy cast iron and steel parts, but by using the higher grades of steel which give the utmost strength and make a light but rigid implement. They are guaranteed to the user for quality of work, ease of operation and durability. An advance in price must be expected on all kinds of implements and we advise our customers to get orders in as early as possible.

fit and work are a part of a vast and indispensable industry, he naturally feels more satisfaction and pride in it—if he is doing such work as a progressive, right-minded man ought to be doing it.

Helping Those Who Help Themselves

If a stock-farmer helps himself by a proper recognition of the great work of the country, in which he has a share if he always tries, as he can, to produce better animals and secure better performance from them, he belongs to those whom the government of this country is very properly trying to help. It is the duty and privilege of every meat producer to connect himself with this public undertaking and avail himself of the wisdom which searching investigation is bringing out and careful publication is making available—through a series of reports and bulletins from the U. S. Department of Agriculture at Washington. One we have particularly in mind in this connection is "Report No. 113" on "Methods and Costs of Marketing Live Stock and Meats"—issued Oct. 7, 1916. You can probably get a copy free by writing to your congressman who is now in Washington. If you wish to "pay as you go" send 25c to Superintendent of Documents, Washington, D. C., telling him exactly what you want as per number and title which we have given above. It is a pamphlet of 100 pages, full of tables, diagrams and pictures which show exactly what the printed page is talking about and it will give you a good full week of evening study—just right for these long winter evenings. After you have accomplished that study you will feel that you surely do belong to a great complex industry, if you are the right kind of a stockman, and you will feel like doing something to help yourself and your fellows in the same line and conditions of production.

Co-operation is the Key Route.

Of course you will see that you can do little more than cuss a little if you insist on staying off and flocking by yourself in this matter, and when you begin to feel the weight of that fact write to the Secretary of Agriculture, Washington, D. C., for a copy of Farmer's Bulletin 718 on "Co-operative Live Stock Shipping Associations." It is a free publication: all you have to do is to ask for it on a postal card. We will not try to tell what this free bulletin says because it is so easy to get it and let it talk for itself. If you do not get it you really have no claim to pose as a breeder and seller of livestock. You will hardly be entitled to registry in the jackass rabbit herd book.

But though we will not outline this great source of wisdom and inspiration in co-operative effort in better selling of livestock, we will give a single impressive paragraph from Orange Judd Farmer, written by a member of the association:

The farmers' shipping association of Essex, Ia., was organized a little over two years ago with 24 members, for the purpose of shipping their own stock to market. It has grown to 135 members and in the year ending last November shipped 233 head of cattle in 8½ carloads, 2962 head of hogs in 45½ carloads. The total net receipts for all stock shipped through the association for the year amounted to \$65,590. It is hard to determine just what profits the association made in shipping stock. The

members believe it is safe to say between \$1500 and \$2000. Members only can ship stock through the association. A manager is hired and paid \$5 a day for the actual time he is working for the association. He has entire charge of selling the stock, collecting the money and prorating the receipts. He makes a full and complete report to each shipper. He goes to the stock yards with each load of stock. The members notify the manager the kind, weight and time they will be ready to ship. When a carload is reported the manager orders a car and notifies each man when to bring his stock to the station. The members believe that they market their stock better through this association than by selling to local buyers or shipping individually.

A Route without Terminal Facilities.

That seems very concrete and satisfactory. But in the California case to whom shall the manager of such a co-operative association ship the stuff? Should he get bids from different packers and sell before shipping, or ship to the squarest packer he can find and trust to his fair dealing? Or should we have stock yards in Los Angeles or San Francisco or both? Or shall we wait until Col. Weinstock gets his corrals built at several points? Surely our stock growers' brains need not addle for lack of exercise!

Will the Railways Furnish Them?

Would it not shock you to wake up some morning to find a railway freight agent in your corral waiting to take charge of the selling-end for you? We read last week that Hugo Arnstein, traveling freight and passenger agent of the Oakland, Antioch and Eastern Railway, at a luncheon of the Transportation Club of the Oakland Chamber of Commerce, said that all transcontinental railroads are now contemplating the establishment of selling bureaus for the benefit of farmers and stock raisers. He also said:

Many farmers have difficulty in finding a market for their products. A freight agent, traveling through the territory, can secure a list of all products for sale, and, through a bureau in the market cities of each railroad, can secure purchasers without any cost to the farmer. All the railroads will ask for this service is that the line making the sale be allowed to carry the product to market.

Lo, the poor middleman! He thought he was hard hit by farmers' and consumers' organizations, but here goes a locomotive right over the middle of him!

SKIM MILK FOR HOGS OR POULTRY.

To the Editor: Will you state the value of separator milk for feeding to hogs and chickens? I believe it to be worth a lot now as feed is so high and as where I sell my chickens they want mill feed, and as I do that and have fat young chickens I get two to three cents above the market price.—N. H. B., Lodi.

[Answered by Prof. J. I. Thompson, University Farm, Davis.]

The regular way of figuring the value of skim milk per gallon is to divide the price of grain (for example, barley) by six, and divide that by 8. Supposing the price of barley is \$1.80 per 100 pounds, this divided by 6 would give 30c per 100 pounds as the relative value of the skim milk when barley is \$1.80; the 30 divided by 8 would give 3¾c per gallon for the milk. This figuring is based on the general supposition that about 6 pounds of skim milk equals a pound of ordinary grain.

The height of this print of 80,000,000 lbs. of butter is 90 feet—its length 180 feet. An average loss of 10 lbs. of butter per cow by all separators except Sharples causes this appalling yearly cream loss in the United States alone. If all separators were Sharples this immense pile would be saved annually. For this reason: Sharples is the only separator that skims clean regardless of speed. Look back over your past experience with separators. Many a day you determined to turn at top speed and not lose cream. But unconsciously, little by little, you slackened and lost cream. That separator was not a

SHARPLES

SUCTION-FEED CREAM SEPARATOR

If it were you could have slowed down and still gotten every particle of cream. Sharples is the only separator that "meets the moods"—almost human in its adaptability to every day conditions. It's the separator that not only can do unequalled work, but will do it, regardless of unfavorable circumstances. Sharples is

- the only separator that skims clean at widely varying speeds.
- the only separator that delivers cream of unchanging thickness—all speeds.
- the only separator you can turn faster and finish skimming quicker.
- the only separator with just one piece in the bowl—no discs, easiest to clean.
- the only separator with knee-low supply tank and a once-a-month oiling system.

Over a million users! Made and strongly guaranteed by the oldest and greatest separator factory in America. Many a Sharples has been in constant use for 25 years at trifling repair cost. Send for free Catalog to Dept. 31.

Cream Pooling Associations Successful.

[By Frank F. Lyons, San Joaquin County Farm Adviser.]

In the spring of 1915 a great many complaints were heard from the dairymen of the South San Joaquin in regard to the treatment which they were receiving from the creameries operating in that section. Most of these complaints came from the Ripon section, so it was decided to send an Assistant Adviser into that section to make a survey of the conditions.

The canvass obtained the number of dairy cows and young stock in the section, the disposal of the dairy produce, the number of acres of alfalfa, corn, and other crops each farmer owned, and the attitude of the dairymen towards an association of some sort.

Three forms of co-operative organizations could be organized in that locality which would more or less remedy the situation. These were: (1) The co-operative creamery, which meant a strong organization, a large outlay of capital, and the employment of high-class men. (2) A co-operative cream depot which meant the renting of a building, the buying of a team or auto-

mobile truck for the collection and the raising of a rather large amount of money. (3) A pooling association, which meant the pooling of all the cream and selling it by sealed bids to the creamery. It required but a loose organization and practically no capital.

Realizing that there were not enough cows in the community to keep a successful co-operative creamery running and knowing the financial condition of most of the dairymen, the co-operative creamery was advised against as an expensive and disastrous undertaking. The co-operative cream depot was also advised against as it required capital and could not bring about any better conditions than a pooling association. It was decided to organize a cream-pooling association.

The first object of the pooling association was to bring about co-operation between the creamery and dairymen. The situation as it existed in the Ripon section tended to everything but co-operation. There were five creamery wagons collecting in that section where there was only enough cream for one. These creameries in their struggle to keep going in that section made co-operation between the creamery and the dairymen almost impossible. The dairymen were continually changing from one creamery to another. The creameries, realizing that their customers were not permanent, were not very particular as to their treatment of the individual dairymen. By pooling all of the cream and selling it by sealed bids to one creamery, all of the other creameries in the section, whose upkeep the dairy-

men had to pay, were done away with. The association cream is worth more to the creamery than that of the individual dairyman, for the creamery man is sure of it for one year without the cost of soliciting new members. A large amount of cream is collected in one territory, cutting down the cost of collection and making it profitable to collect every day, thereby securing a better grade of cream.

As a protection for the dairymen, the creamery was required to put up a bond to cover at least one month's cream checks.

To prevent dissension in the test, and to get a uniform sample of cream the cream collector is required to sample the cream on the dairyman's place and divide the sample, giving one-half to the dairyman and taking the other half to the creamery. The association maintains a tester whose duty it is to test the samples of cream at any time for the dairyman, so as to get a check on the creamery test.

In order to prevent continual and unjust complaints from the individual dairyman a Grievance Committee is provided for, consisting of one dairyman, the manager of the creamery, and one neutral person who is neither a dairyman nor a creameryman. This committee receives all complaints and passes on them, and their decision is final both to dairyman and creameryman.

The pooling association has all of the advantages of a co-operative creamery and it does not require any expenditure of capital by the dairyman. It has one advantage over the co-operative creamery as the dairyman is more assured of having his cream handled under better management than in a co-operative creamery, as the manager of the creamery is usually the owner or one of the owners, in the case of the pooling association, and gives the creamery work his personal supervision. In the case of the co-operative creamery the manager is usually an outside man working for a salary and has no personal interest in the working of the creamery.

The Ripon Farm Center Pooling Association was organized with 66 members and about 900 cows. The board of directors of five members was elected and the cream tester and grievance committee appointed.

Some eleven or twelve creameries bid on the cream, which was finally let to the Modesto Creamery. Practically all the dairymen received during the first year of the organization was a square deal in both test and price of their cream, and also a good lesson in co-operation. The second year there was much more competition in the bidding, as the creameries realized the benefits of dealing with such an association. The best bid was made by the Stanislaus Creamery of Modesto, which put up a bond in the bank of Ripon to cover one month's cream checks and paid the dairymen 4c net over daily San Francisco market quotation, regardless of the price of cream. At the present time the association has a membership of over 80 dairymen, with over 1200 cows.

The success of the Ripon Association has spread throughout the county and State. Two other pooling departments of the Farm Bureau have been organized in the county and others are being agitated. The two new ones are the Escalon department with 76 members and 516 cows, and the Waterloo department with 46 members and 350 cows.

The Madera and Stanislaus County Farm Bureaus have organized pooling departments, and others are being contemplated by other Farm Bureaus of the State.

WHERE TO GET DAIRY LAWS.

To the Editor: Can you publish the new dairy laws? If not, advise me where I can get same. How often is a dairy inspector supposed to visit a community?—A Subscriber, Ripon.

Space does not allow us to print the State dairy laws in full, but you can get a copy of same by applying to F. W. Andreason, Secretary of the State Dairy Bureau, San Francisco, Cal. State dairy inspectors have no definite time to call on dairymen for inspection purposes. They have to use their own judgment in this regard. With the large territories allotted them, however, it is difficult for them to cover their entire district more than once a year, as a rule. If your dairy is bad, don't be surprised to find them around several times a year. If they have to come too often though, you are apt to be out some good money, both in fines and improvements.

HOLSTEIN CATTLE

The undeniable fact that the Holstein-Friesian Association of America is the largest and most prosperous dairy cattle association in America, that its membership is over 7,000 more than the combined memberships of the other dairy cattle associations, and that it increased its membership by 1,260 during the fiscal year ending April 30, 1916, are primarily a fitting testimonial to the superior merits of the pure-bred Holstein-Friesian cow, that yields more milk for a day, for a year, for a lifetime and for profit than any other cow.

COST OF CARING FOR SHEEP ON RANGES.

[Written for Pacific Rural Press]

That there is an erroneous idea as to the cost of feeding sheep under range conditions was brought out by Fred Ellenwood of Red Bluff at the annual meeting of the California Wool Growers' Ass'n held recently at Davis.

During a discussion the statement was made that the wool from a ewe would pay her keep for a year, leaving the money received for the lamb as profit. While this idea has been oftentimes expressed Mr. Ellenwood showed that it is misleading, for unlike many sheep men he keeps a set of books and he finds that for the year 1916, with exceptionally high wool prices and well-bred flocks, his wool clip amounted to \$2.00 a year while his cost of maintenance was \$4.50. In this charge he included management, labor, grazing fees, loss of lambs and ewes on the range, and interest on investment.

With lambs selling for \$6 this would mean an annual profit per ewe of right around \$3.50 under conditions as they are in Northern California, but as Mr. Ellenwood has as well-bred flocks as can be found on the range, his profits are doubtless more than the average sheep grower realizes.

Another grower present, in discussing the loss by poison plants, varmits, etc., on the open range, estimated that there is fully 4 per cent loss, which is much heavier than he experiences when his flocks are on valley lands.

THE NEW DE LAVAL

A Bigger and Better Cream Separator for the Same Money

THE FARMER who buys a De Laval this year will get bigger and better value for his money than ever before.

Not only will he get a better machine, a simpler machine, a machine that will skim even closer than any previous De Laval, but he will get a machine of larger capacity.

And the price has not been increased one cent.

Just think what that means to cow owners in the face of rising prices on almost everything else the farmer has to buy, including other cream separators.

Only the tremendous volume of De Laval sales makes it possible to give the farmer more for his money when others are giving less.

The NEW De Laval is the culmination of nearly forty years of experience and development by the largest and oldest cream separator concern in the world. It represents

The greatest improvement in separator construction in the last thirty years

If you are trying to get along without a cream separator, or with a half-worn-out or unreliable machine, why not get a NEW De Laval NOW and stop your cream waste? You don't need to count the cost, because the De Laval will soon pay for itself.

There's a De Laval agent near you who will be glad to explain all the improvements and advantages of the NEW De Laval, and who will set and start a machine for you on your farm and let you try it for yourself.

If you haven't the spare cash right now, that need not stand in the way of your having the use of a NEW De Laval the rest of the winter. We have an arrangement with De Laval agents which makes it possible for any reputable farmer to secure a De Laval on the partial payment plan—a small payment at the time of purchase and the balance in several installments—so that your De Laval will actually pay for itself while you are using it and getting the benefit from it.

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for any desired information.

Every NEW DE LAVAL is now equipped with a Bell Speed-Indicator

The "Warning Signal" which insures proper speed and uniform cream

Because nine people out of ten turn the separator handle too slowly and because this always means loss of cream and cream of uneven thickness, every cream separator should be equipped with a reliable speed indicator.

Every NEW De Laval is now so equipped. The De Laval Bell Speed-Indicator is simple. It is accurate. It is reliable. There is nothing to wear out or get out of order. No matter who runs your De Laval, the "warning signal" will tell you when the speed is not right. You hear it and do not need to see it.

THE NEW SELF-CENTERING DE LAVAL BOWL

Some of the points of superiority of the NEW DE LAVAL

The New De Laval bowl design and the new method of delivering the milk into the discs give increased capacity without increasing the weight or size of the bowl or increasing its speed. The incoming whole milk is delivered beyond the cream wall, and this, in conjunction with the improved design of the bowl, makes possible closer skimming than ever before, especially under the more difficult conditions of separation, such as skimming a very heavy cream or separating milk below usual temperature.

The much lower speed of the De Laval than other cream separators (in most cases from one-half to one-third less) insures minimum wear of gears and much longer life of the machine.

The New De Laval concave-bottom, self-centering bowl is so designed and so supported by the detached spindle that it will run true and do perfect work even after long wear, the great importance of which every separator user will appreciate.

There are fewer discs in the New De Laval bowl, and all discs are unnum-

bered and are interchangeable.

By reason of its ample construction and the fewer number of discs, the New De Laval bowl is more easily washed and cleansed.

All New De Laval bowls are automatically oiled, every moving part of the machine being bathed in a constant film of oil. There are no oil holes anywhere on the machine, and the sight feed oil cup on the top of the frame provides for a constant supply of fresh oil.

The gears, pinions and other moving parts of the De Laval are exceedingly simple in arrangement, substantial in dimensions and always interchangeable.

The De Laval tinware is sturdy and heavily tinned, well suited for long and hard wear, and easy to clean.

The low speed of the De Laval bowl, in combination with greater capacity for a given size and weight of bowl than is found in other separators and the automatic De Laval oiling system, make the De Laval the easiest cream separator to turn.

New Catalog will be mailed upon request.

DE LAVAL DAIRY SUPPLY CO.

LARGEST DAIRY SUPPLY HOUSE ON THE PACIFIC COAST.

50,000 BRANCHES AND LOCAL AGENCIES THE WORLD OVER.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING.

The Modesto Creamery has just made its first shipment of cheese to New York, the car containing 25,000 pounds.

After February 1 all milk sold in the city of Stockton will be graded to comply with the dairy laws that went into effect last fall.

The annual report of the Oakdale Creamery showed that \$120,000 was paid to dairymen in the Oakdale district by that concern during 1916.

Four cow testers are now in the employ of the Imperial Valley Cow Testing Ass'n and another may have to be added to take care of the new herds which are being added.

Among others who are establishing purebred herds of livestock in Tulare county is R. C. Sturgeon who is improving his ranch and already breeding purebred Holsteins and Duroc Jersey hogs.

A field representative of this paper reports that alfalfa hay is very scarce in the vicinity of Fresno, selling for \$14 a ton loose. Dairy cow values have dropped to \$60 to \$70 on that account.

A meeting of Elk Grove and Hood dairymen was held last week to discuss the formation of a milk producers' association in the Sacramento valley. In an address J. M. Henderson made the statement that few if any dairymen in that district are making money.

A bill has been introduced in the legislature by J. E. Manning of Marin county asking for the repeal of the dairy laws which went into effect last October. He takes the ground that the law cannot be enforced accurately because of the uncertainty of the present tuberculin test.

The man who milked Joel Anderson's high grade Guernsey herd in Imperial Valley for three years and kept records of milk and fat, bought 30 of the cows about Thanksgiving, leased 60 acres of the Anderson ranch and is going into business for himself, having selected his cows for their records.

F. H. Stenzel, prominent Holstein breeder of San Leandro, reports the following sales of registered animals: one bull to M. C. Gammon, Lodi; one bull to A. J. Washburn, Winters; one bull to Alameda County Infirmary; one bull to Z. T. Withrom, Fairmead, and a heifer and bull to Ernesto Loida for Mexican shipment.

Dairymen of Tulare county as well as members of the California Creamery Operators' Ass'n propose to fight the reported bill introduced into the legislature which would require the branding of all cows in a herd where reactors to the tuberculin test are found. The dairymen favor the branding of affected animals but are opposed to branding well animals as well.

A. G. McFarland of San Mateo county advises us that his son, E. B. McFarland, is at present in Canada where he has purchased 30 head of registered Ayrshires for California shipment. He states that he has visited all of the prominent Eastern Ayrshire breeders but was unable to secure good stock at any price from them because of the general scarcity of breeding stock.

Malcolm H. Gardner reports that the Holstein record for fat in the junior two-year class for seven days not less than 240 days after freshening has been broken by Jewel Pontiac Segis who produced 473.6 pounds milk containing 17.653 pounds fat. Also that Fancher Farm Maxie has broken the seven-day record for senior four-year cows in producing 597.1 pounds milk containing 37.435 pounds fat.

BEEF CATTLE.

The long cold and dry spell of the past month is said to have worked serious damage to cattlemen in the Livermore Hills. Hay is having to be fed, only fair grades costing \$16 to \$17 a ton.

Two steers weighing approximately 5,000 pounds were recently shipped from Glenn county to San Francisco butchers. They are said to be the largest cattle ever raised in Glenn county.

The Oakland Meat Co. is making weekly shipments of 150 to 200 head of steers from Salinas to their Oakland plant. Most of the steers are being fattened on beet pulp and hay at the Allsal feeding station.

Alexander and Kellogg are erecting another barn on their ranch in Solano county to care for the addition to their herd of Milking Shorthorns. They have recently sold bulls to parties in Fresno and in Madras, Oregon.

Heavy shipments of cattle from Nevada to California points are reported, among those of the past week being 21 cars to Bliss Bros. of Atholene, Merced county, from Elko, and 60 cars from the same place to the Pacific Livestock Co. W. H. Moffat shipped seven cars from Paradise Valley to Galt, Cal., and Miller and Lux shipped 24 cars from Elko to their ranches at Los Banos.

SWINE.

Mrs. Della Foster of Holtville had 528 pigs vaccinated recently to prevent cholera.

The Timken ranches with headquarters at El Centro are using galvanized iron silos.

Wm. Carruthers has recently received what he terms "the best Berkshire sow in America" from the East at his stock farm in Santa Clara county.

The San Francisco Livestock Export Co. have recently purchased four registered Berkshires from York and Son of Modesto for shipment to the South Sea Islands.

Some 750 hogs and pigs were vaccinated for H. A. Terwilliger of Holtville early in January. This took 43 bottles of serum containing 500 c.c. each.

The House of Representatives at Washington has passed a bill designed to regulate the treatment of hog cholera by authorizing the Department of Agriculture to license establishments manufacturing toxins and serums to combat disease in domestic animals.

Dr. C. W. Crawshaw of Hanford advises us that he has recently sold purebred Poland China boars to Sims and Smith of Laton and to a young breeder in southern Illinois. He states that the lot he is consigning to the Kings County Poland China Breeders' sale is the best he has ever offered.

That Holtville hog growers are awake to the value of vaccination as insurance against cholera, is evidenced by the fact that Dr. R. W. Ritter had vaccinated about 3000 head in the month ending Jan. 25. Most of these are pigs weighing around 50 pounds. He has been kept quite busy preventing the disease during all of the past year.

ERRATA IN HOLSTEIN BREEDING.

Mr. DeLancey Lewis of Toyon Farm, Santa Clara county, calls our attention to an error in reporting the sale of Funderne Mutual Fayne Valdessa, the Holstein bull that sold in Washington for \$21,500. Instead of being a son of Spring Farm Pontiac Cornucopia, as stated in these columns, he was a son of King Valdessa. Mr. Lewis further writes

that, as his company has three brothers to this bull, including two three-quarter brothers, and also two sisters to his dam, they are anxious that this mistake be rectified. The pedigrees of these animals are still further strengthened by Segis Fayne Johanna, the 50.68 pounds world's record cow.

JERSEY BREEDERS MEET.

At a meeting of the California Jersey Breeders' Ass'n held at Stockton, Jan. 25, it was decided to allow entries in the Jersey Futurity Stakes to remain open till March 1, although the entry list is already a

large one and augurs a good meet.

A resolution was adopted to approve of a new butterfat test to extend over a period of 300 days, a cow to freshen 290 days from the beginning of the test. Another resolution approved the appointment of a dairymen to the Board of Directors of the State Agricultural Society.

Field Agent J. M. Roberts of the American Jersey Cattle Club presented plans for the organization of breeders' associations in different parts of the State in order to enable Jersey breeders to get together oftener. The next meeting of the association will be held at Davis, April 20.

FREE NEW BLUE BOOKLET—State, Government and Indian Lands. Bargains overlooked. Joseph Clark, Sacramento.

SHORTHORN BREEDERS MEET.

A meeting of the board of directors of the California Shorthorn Breeders' Ass'n was held at San Francisco Jan. 30 to discuss plans for the promotion of their breed. Action was taken favoring the holding of a livestock show in San Francisco in the latter part of 1917 and a committee appointed to investigate ways and means of securing capital for the purchasing of permanent grounds and exposition buildings. It was decided to postpone the holding of a purebred Shorthorn auction sale for the present because of the scarcity of sale stock among members.

TO BUILD STOCKYARDS.

Announcement is made at Sacramento that a union stockyards company has filed articles of incorporation for the establishment of stockyards at West Sacramento. This is the corporation alluded to in these columns by State Market Director Weinstock some time ago. The directors and stockholders are T. S. Glide and J. H. Glide of Davis, Chas. E. Virden of Sacramento, Harry and H. Sam Thorp of Sacramento. It is stated that D. O. Lively will probably be elected manager of the new company.

CARRUTHERS' SHORTHORN SALE

Shorthorn auction sales are to be revived in the State early in May by the holding of the first annual sale of Carruthers' Farms at Mayfield. Mr. Carruthers has been making preparations for the holding of this sale for several months, and promises an offering of foundation animals of rare Scotch breeding that should prove attractive to those in the market for choice Shorthorn cattle. Being an expert judge of the red and roans in both type and pedigree, Mr. Carruthers has been in a position to select his present herd with discretion and prospective buyers should be benefited as a result.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

SWINE.**Poland Chinas.**

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A. Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

REGISTERED SHIRES—Black Hawk Stock Farm. Importers and Breeders, Easton & Ward, Proprietors, Burlingame, Cal.

SAN FRANCISCO LIVESTOCK EXPORT Co., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreets, or San Francisco banks. Office, 319 Underwood Building, 525 Market St. San Francisco.

LIVE STOCK INSURANCE—Registered live stock and farm work horses should be insured. The Hartford Company, strongest in the world, writing live stock. No trouble to answer questions. D. O. Lively, special representative, 215 Hobart Bldg. San Francisco.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal, the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

Calculations on Material for Silo.

To the Editor: How much lumber is required to build an 80- to 100-ton resaw silo? What size studding and how far apart should they be placed? What kind and grade of lumber should be used for the lining? Can the lumber be bought ready to nail on or will the boards need to be sawed after buying at some planing mill? What width boards should be used? What should the material cost?—G. W., Willows.

[Answered by Walter F. Mitchell, Prop. Packwood Farm, Visalia.]

This is a list of material I used in my silos: 12 pieces 1x8x16 feet, redwood; 45 pieces 2x3x32 feet, Oregon pine; 2 pieces 2x3x12 feet, Oregon pine; 2 pieces 2x2x32 feet, Oregon pine; 2900 feet, 6-inch redwood resaw; 18 squares of one-ply roofing paper.

Building Cement Foundation.—To lay out the foundation first, drive a pin in the center where the silo is to be built. Then take a 1x4 and bore a hole in the end, 7½ feet from the out end. This will give the circle for the foundation. Take some of the resaw and stake it down around the circle, then pour the cement five inches thick. When this is done bore another hole 7 feet 2 inches from the other hole in the 1x4 and put a pencil in it. This will give the proper circle for setting the studding.

Now take the 1x8 pieces of redwood and cut them three feet long. Then lay them around the edge of the concrete foundation, doubling them and breaking joints. When this is done take the 1x4, with pencil in the end, and scribe around on them. This will give the line to set the studs to. Take the remainder of the 1x8s and cut and lay around the foundation in the same way, also scribe around them. Cut to this line with a band saw. These are the top plates. Now we are ready to make the ladder of the door or window frames.

Window Frames.—Take four of the 2x3x32 studding and nail together in pairs, then take the 2x2x32 and nail one on each pair of studding; this makes the window stops. Next take the 2x3x12 and cut pieces 20 inches long and set them in be-

tween the stops; this makes the width of the window. Next take the rods and put them through just under the cross pieces; cut fillers and nail inside of the cross pieces, top and bottom of the window. These keep the circle for they are all to be cut on the same circle.

Now the Ladder is Ready to Raise.—This can be best done by a team, steadying it with guy wires, but before raising the guy lines have a man on top of the ladder nail on the circles, brazing them well with number 12 wire as he goes around.

Nailing Resaw.—When the studdings are raised, plumb them and you are ready for the resaw. Run the first layer six feet up the side and then put on the Ruberoid paper, laying it the same way of the resaw and then put on the second layer of resaw. Now put in a staging, using three pieces of 2x6 Oregon pine crossways of the silo. Six- and eight-penny box nails should be used for nailing onto the resaw. When this is done put on four band iron hoops, made in halves and put together with a screw at each end. In nailing on the resaw board up the first four feet before leaving a window, then leave every other opening boarded up thus making a much stronger silo.

Windows.—These can be made of 1x12s covered with building paper so that the paper extends out over the resaw. They can be made when filling is being done.

This makes a 110-ton silo. If a smaller one is needed both the diameter and height can be cut down. I set the studding on 12-inch centers and used resaw that had been sized on all sides. I cannot say exactly now, but any lumber dealer can give you figures on that. The paper and hoops will cost about \$15.

A CRITICISM OF HOG VALUES

To the Editor: I have just read your article on "Razor" and "Chunk," and think you did not go far enough in your deductions. According to your figures the cost of dressed meat in "Razor" was \$.13 a pound and in "Chunk" \$.12, while the selling value of "Razor" was one cent a pound less than "Chunk." This would indicate that, to be fair to the producers, they should have been paid for "Razor" on foot one cent less and for "Chunk" one cent more—i. e., 7½ cents for "Razor" and 10½ cents for "Chunk"—in order to pay the producer the proportionate value of each hog. If there was some such difference as that in the price paid for different classes of hogs I believe it would not be many months before the "Chunk" class would be greatly increased and the "Razor" class decreased.—H. N. Colver, Wasco, Cal.

You are perfectly justified in your criticism, and have struck what we believe to be a constructive note when you suggest a wider spread in hog values. As we understand it there is a committee of growers and packers now at work to overcome this very objection.—Eds.

After a sheep is four years old, one cannot tell by the teeth about the age. One who is purchasing sheep should see to it that it has not lost any teeth, or that the teeth have not become too badly worn to allow good chewing of food.

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW.
P. P. I. E. 1915; Sacramento, 1916.

For many years at widely separated shows, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Young stock, \$30 Up.
M. BASSETT,
Box 1, Hanford, Cal.

A Special Offering of BERKSHIRE SOWS

Hogs are high in price. Hog Feed is high in price, and Stockmen are selling both. This makes Hogs more scarce and higher in price.

NOW IS THE TIME TO BUY GOOD FOUNDATION ANIMALS.

Anticipating the present hog situation, we are breeding 50 of our best sows for the Spring trade, and at the prices we are asking for them, they are bargains. We have a little catalog telling about the sows and the boars they are bred to that is free for the asking. Write for it.

We also breed SHORTHORN Cattle, SHROPSHIRE Sheep and PONIES.

VETERINARY QUERIES.

[Answered by Dr. H. B. Winttingham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for \$1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

OX WARBLE FLY.

To the Editor: What treatment should be given a cow who has several lumps, resembling boils, on her back. They are quite hard and there is a round smooth opening in the skin over each one, through which there is a discharge at times.—C. C. B., San Jose.

These lumps are caused by the larvae of the Ox Warble fly which hibernates under the skin. Press out the worms through the openings. They do no harm unless present in large numbers.

COW COUGHS, CAN'T BELLOW.

To the Editor: What is the cause of a three-year cow's inability to bellow? She has a peculiar throaty cough as of some obstruction, more pronounced when eating dry hay. At times in coughing, she seems to gag. Is in good condition, calved two months ago, and gives three gallons of milk per milking. She has had this complaint since last spring, only it is now worse than ever.—M. G., Lincoln.

Have this cow tested for tuberculosis.

BETTER RATION FOR GOAT DOGS.

To the Editor: I feed my goat dogs on a bread made by baking bran, middlings and corn meal in equal parts, shortened with goat

tallow and flavored with salt, sulphur and soda; the whole moistened with skim milk. They seem to do well on it, but it is very laxative. Could anything be added to counteract this effect, take the place of meat and otherwise strengthen it? The dogs must travel from 100 to 200 miles daily and are invaluable in the coyote question.—M. W., Cool.

Cut out the sulphur, saltpeter and soda. Place a few well-cooked bones in the mixture and you will have a good ration.

COW GIVES CHEESEY MILK.

To the Editor: We have a Jersey cow that is due to freshen about Mar. 30. She gives about two gallons of bright yellow milk, but we notice when we strain it there is quite a lot of yellow "cheesy" particles on the strainer. What is garget? What causes this? Give cause and treatment.—S. R. C., Santa Rosa.

Garget is a general term applied to all chronic conditions of the udder and has too many causes to be taken up in the space allotted here. Give the animal one dram potassium iodide dissolved in water twice a day. It is probable that this cow will come in sooner than you expect, so dry her up.

COWS SCOUR.

To the Editor: Last spring some of my cows got to scouring about four weeks after being fresh, and got very thin. They failed from four to one gallon of milk daily, and have never come back to their full flow. They run on Bermuda and alfalfa, and I feed them a little hay twice daily. How can I prevent them from scouring? What causes it?—J. H. P., Kingsburg.

Give the affected animals six 30-grain tablets sulphocarbolates twice a day. The cause, at this distance, it is impossible to give.

LUMPS ON BAGS.

To the Editor: A cow has a large lump in her bag just at the root of her teat. It gathers and breaks. Seems as if something either bit it or something has been injected into the bag. Every fresh cow is the same. We sold the old ones and bought fresh ones, but they were just as bad.—N. T., Alvarado.

Would suggest that you call in your veterinarian and have him get a vaccine made up from some of the exudate; as you have a chronic infection in your herd.

LOOKS LIKE GLANDERS.

To the Editor: I have a mare that has had distemper for over a year and I fail to find anything that will cure it. She runs at the nose and the large glands behind her jaw are swollen at times. She only coughs when she eats dusty hay or gets warm. Can you tell me what to do?—O. B., New Pine Creek, Ore.

This looks very much like glanders. Have your veterinarian in and the horse tested.

A CASE OF STRINGHALT.

To the Editor: I have a horse that steps about, raising one hind foot and then the other as if the feet were cramped. He is about 12 years old. He does this especially when working. He is, not lame, and I can find no limps or sore places by feeling. Kindly advise me.—G. H. R.

This is a case of stringhalt. An operation is occasionally successful.

Here's Where it Tells.

It isn't a question of sentiment whether or not your cows are in the pink of condition—but it does make a big difference in your bank account. Since you are keeping cows for milk instead of for meat, better see to it that their milk-producing organs are kept working normally.

At the first sign of decreasing milk-flow, look for the cause. Ten to one it is due to some trouble with the digestive or genital organs, and such disorders are best set right by the use of Kow-Kure, a cow medicine backed by twenty years of success. Try Kow-Kure on your poor milkers and watch results. Hundreds of doubting cow owners have been convinced that this old remedy has no equal for the prevention and cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Lost Appetite, Scouring, Bunches, etc. Buy Kow-Kure from your feed dealer or druggist; 50c. and \$1.00.

WANTED—White Cornish Game Cock. Write Chas. Hertzog, Los Molinos, Cal.

Raising Poultry for Profit

COMMON MISTAKES IN BROODING CHICKS.

[Written for Pacific Rural Press by Susan Swayngood, Pomona.]

Brooding chicks in small lots does not require much skill, but when we put several hundred or a thousand chicks into one house, under one hover or compartment, it calls for good management and a lot of patience to brood them safely.

Too Much Liberty Not Good.—The most common mistake people make is in allowing the chicks too much liberty during the first two or three days. The chicks get in corners and fail to get back to the hover before they are chilled. Then perhaps a slight diarrhea attacks that one or two chicks, which is communicated to others that are not strong enough to resist, and in a week or so we have a number of chicks pasted up at the vent. Now, it is always safer to remove the first few cases, if possible and save trouble. Still better is it to protect all of them from straying away from the heat until they have learned well where to run to get warm. If the hover is long, there should be boards about six or eight inches wide with boards of similar width nailed across both ends as an aid in protecting the ends of hover and to serve as legs for the long boards. If these boards are set out about one foot at first, the chicks will soon learn the way back to the warmth under the hover, and each day these boards can be set further out until the chicks have all the width of the room at their disposal.

Protect Chicks from Chilling.—If the brooder is round, like the International and the Victor, get the smallest mesh wire that is pliable, and make a ring to go around the hover, lapping over wire enough to give more room the second or third day. This is the easiest and safest method of protecting chicks from

chilling the first few days and nights. For some days after the guards are taken away it is prudent, to guard against the chicks' early-rising habit, to put them up last thing at night.

Increasing Heat.—Another common mistake made by people who are left in charge of brooders is to think that because the chicks are out from under the hover, exercising or eating, they need no more brooding in the day time. Some people are so bent on saving oil that they shut off the heat almost entirely early in the morning. Instead of lowering or shutting off the heat, it should be increased as soon as the chicks begin to leave the hover. The reason for this is two-fold; first, it needs more artificial heat to replace the animal heat lost by the chicks going outside the hover; again, it is needed to warm the room and hover so that if a chick feels cold it may run under the hover to get warmed up. It should be able to warm up quick

Wonderful Egg Producer.

Any poultry raiser can easily double his profits by doubling the egg production of his hens. A scientific tonic has been discovered that revitalizes the flock and makes hens work all the time. The tonic is called "More Eggs." Give your hens a few cents' worth of "More Eggs" and you will be amazed and delighted with results. A dollar's worth of "More Eggs" will double this year's production of eggs, so if you wish to try this great profit-maker, write E. J. Reefer, poultry expert, 4802 Reefer Bldg., Kansas City, Mo., who will send you a season's supply of "More Eggs" Tonic for \$1.00 (prepaid). So confident is Mr. Reefer of the results, that a million-dollar bank guarantee if you are not absolutely satisfied your dollar will be returned on request and the "More Eggs" cost you nothing. Send a dollar today or ask Mr. Reefer for his Free poultry book, that tells the experience of a man who has made a fortune out of poultry.—Advertisement.

Send For A Sample Of Calmade Graduated Poultry Fence

10 inches graduated in mesh from 1/4 inch to 1 1/4 inches then 20 inches of 2 1/4 inch mesh, topped by 4 1/2 inch mesh for the height of the fence.

The Fence Without a Sky Line

It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, large fowls can't climb it.

"CALMADE GRADUATED" Fence will not slip at the joints nor unravel when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or bend on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

San Francisco Office,

1210 Flood Bldg.

and get back again to hustle for its share of the feed. If the hover is cold the chick stays there, expecting to get warm, because it has been trained to expect warmth under that hover.

Changeable Heat.—The next mistake in brooding is in not keeping the heat as uniform as possible for the first few days. After the chicks have got a good start, begin to lower the heat according to the strength and size of the chicks. It is a mistake to attempt to regulate the heat according to age of chicks, for some chicks at three weeks old are larger and stronger than others at four or five weeks. If you begin to brood a batch of chicks at, say, 95 the first day, and the next day you let the heat run up to 100, then let it go at 90, is it reasonable to expect little chicks to stand the change without suffering? They will both feel it and show it. There will be pasty vents, down rough and ragged, eyes that look watery, and a general appearance of unthrift. At this stage, many begin to blame the feed, because they do not know what else to blame. They do not realize the difference between the little mite of a chick, with scarcely an ounce of vitality, and themselves.

Putting the Chicks to Bed.—To a great many this may sound foolish. Why, you say, chicks know enough to go to bed. True, most chicks know it after learning where their bed is, but you will find that while they know enough to go to bed, or under the hover, they don't know how to go to bed right. Faulty heating appliances more than any other thing are to blame for chicks going to bed wrong. Some hovers are warmer at certain places and cold in others; but even when everything is O. K. it still pays to put the chicks to bed properly. It only needs doing for a few nights, and the education of the chick is complete. The procedure consists in staying in the brooder house quietly and watching more than doing. If the chicks seem determined to bunch up in one particular place, take possession of that place. If the place is distant from the hover, they won't often bunch up under it, but if it is just outside or in corners, they will. If they are inclined to crowd in corners, wire the corners off with fine mesh wire; and if they still insist on bunching or piling up wait until all is quiet, darken the windows and keep still, when they have settled down, then go around quietly on your knees, and with your hands spread the chicks under the hover. Chicks are always docile in the dark, and while this may be a little trouble, it pays many times over, for if you leave them spread evenly under the hover, unless the heat goes down, you will find them in the same position in the morning. I know of no one feature in brooding that pays bigger returns than putting the chicks to bed for a few days.

POULTRY PRODUCERS JOIN SAN FRANCISCO DAIRY EXCHANGE.

War has been declared by Fred L. Hilmer on the Poultry Producers of Central California, Incorporated, which was recently organized by State Market Director Harris Weinstein, the members of which own or

control about 1,500,000 hens. For several years Hilmer has marketed, under contract, the eggs produced by the members of the Sonoma County Poultry Producers' Federation, a former organization which is now succeeded by the Market Director's organization, and he claims that because his efforts have resulted in higher prices for eggs and greatly bettering the condition of the poultry producers he should be entitled to continue as chief distributor for the newly incorporated company. On the other hand, the Market Director and the Board of Directors have de-

cided that the eggs be distributed by twenty-eight of the members of the San Francisco Wholesale Dairy Exchange. This arrangement will become effective February 10.

Hilmer has sent representatives to Sonoma county and he has established his campaign headquarters in Petaluma from which to direct his battle. As a counter move, J. H. Barber, Vice-President of the Poultry Producers' company, has secured a warehouse in San Francisco as a receiving depot from which to make deliveries to the twenty-eight egg handlers who are members of the

Wholesale Dairy Exchange. The Poultry Producers' company will itself have a seat on the exchange, and the company's representative will be able to bid up the price whenever he thinks quotations are below market values.

The Poultry Producers of Central California, Inc., was organized, under the State Marketing Act passed by the Legislature in 1915, for the purpose of combining all of the poultry-keepers into selling organizations. In addition to the Central company one has been formed in the southern end of the State.

\$1150 Model Also Now On Show See the New Mitchell Junior With Hundreds of Mitchell Extras

Now we invite you to see Mitchell Junior. A somewhat smaller Mitchell—a \$310 lower price than the 7-passenger Mitchell. But with generous size and ample power for a 5-passenger car. And with all the exclusive Mitchell attractions, due to John W. Bate.

Another step in Mitchell efficiency appears in the new Mitchell Junior. We urge you to come and see it.

A 7-passenger car, to have ample power and ample room, can't be smaller than the \$1460 Mitchell, which has won for itself one of the envied places in the motor world. But 40 horsepower is enough for a 5-passenger car. And a 120-inch wheelbase gives room enough—more than most cars give.

So the Mitchell factory this year also brings out Mitchell Junior. Not a new type—simply a size reduction. So a man who buys a Mitchell can get the size he wants.

Thousands of these new cars have been run for months, on every sort of road. And they have proved themselves as perfect as the 7-passenger Mitchell car itself.

See the New Extras

In both Mitchell models there are hundreds of extra features. They give you at least 20 per cent extra value over any other car in this class.

These extras—most of them exclusive to Mitchells—are paid for by factory savings. They are the result of efficiency methods, applied by John W. Bate.

This great efficiency engineer built

and equipped this whole plant. Every method and machine is adapted to producing this car economically. These methods have cut our factory cost in two. Nowhere else is a car of this class built anywhere near so low.

You will be amazed to see how many extras these new-day methods pay for.

Double-Strong Parts

One result is the Mitchell standard of 100 per cent over-strength. That is, every vital part is twice as strong as need be.

The Mitchell standard used to be 50 per cent over-strength. That itself was extreme. The Mitchell car has always been a marvel of endurance.

But, in the past two years, we have

doubled this standard to give you a lifetime car. That fact is announced for the first time in the models now on show.

Over 440 parts are built of toughened steel. All parts which get a major strain are built of Chrome-Vanadium, and built oversize. We pay for steels in the Mitchell as high as 15 cents per pound.

31 Unique Features

There are also 31 extra features in Mitchells. That is, features which nearly all cars omit. Things like a power tire pump, reversible headlights, ball-bearing steering gear and never-broken springs.

These extras alone, on this year's output, will cost over \$4,000,000. But all are paid for by these factory savings.

Many New Luxuries

Our new body plant gives us for this year another enormous saving. All Mitchell bodies, open and enclosed, will be built in our own shops.

This saving enables us to add 24 per cent to the cost of finish, upholstery and trimmings. The finish coats are now heat-fixed. A rare-grade leather is employed. A hundred new touches make today's Mitchell the handsomest car in its class.

Every Mitchell extra is something that you want. Nearly all are things you don't find in other like-class cars. They are things which can't be given without added price, save under Mitchell methods. Go and see them. Judge for yourself what they mean to you. And see which size you like best.

MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.

TWO SIZES

Mitchell—a roomy, 7-passenger Six, with 127-inch wheelbase. A high-speed, economical, 48-horsepower motor. Disappearing extra seats and 31 extra features included.

Price \$1460, f. o. b. Racine

Mitchell Junior—a 5-passenger Six on similar lines, with 120-inch wheelbase. A 40-horsepower motor— $\frac{1}{4}$ -inch smaller bore than larger Mitchell.

Price \$1150, f. o. b. Racine

Also all styles of enclosed and convertible bodies. Also demountable tops.

Mrs. Best's Letter.

My dear Friends:

Now that we have all taken advantage of the wonderful January sales and have our winter wardrobes in good condition, it is to be expected that the weather will become balmy and spring garments be in order.

The new spring suits are similar in cut to many we have seen this winter and stitching seems to be first as popular a trimming as ever. Especially in the high collar, military effect, stitching around the collar and down each side of the front is very effective. Some of these coats have a stitched belt, while others have a narrow leather one.

One of the new materials or rather designs for waists is Paisley chiffon and satin. In some cases the whole waist is made of the Paisley satin with collar and cuffs of white while in other cases it is combined with a plain material of harmonious colorings.

Separate skirts are very good style and one of the most popular is a washable white silk made in a box-pleated style. Others are simple two-piece skirts of gay stripes in the new silks that very closely resemble the old rajah or rough pongee.

For wear with these separate skirts, the sweater is invaluable and they range from the real silk to the furry Angoras in all colors and color combinations. There are also pongee sport coats in Norfolk style with bright silk collar and belt that are moderate in price and would be quite serviceable.

The new ribbon hats are not of one color as last year, but have a combination of colors. One I saw was made of narrow picot edge ribbon slightly ruffled and in alternating rows of green, brown, red, white and yellow. That sounds gaudy, but it was not, for the colors were soft and the ribbon narrow. There was no trimming at all upon it. The all-white ribbon hats are so girlish and pretty, I am hoping they will appear a little later.

Jersey cloth continues to be very popular for suits and is being worn the year round, a surprise to many, who had considered it only a summer material.

One of the good shops is showing a large line of sport skirts for early spring wear with tailored suits or for outdoor sports. These are plain of course, with large collars either square or round, or have the convertible collar to wear with stocks, and come in linen, pique, Japanese silk and crepe-de-chine.

Rosabella Best.

ORANGE CREAM.

Orange makes a delicious cream. Pare off a few bits of yellow rind and soak in the water in which the gelatine is dissolving. Squeeze and strain the juice of four oranges. Sweeten and mix with the yolks of four eggs. Add the dissolved gelatine white hot, strain and when almost cold stir in lightly a pint of whipped cream.

To Wash a Clothesline.—Wind around the back of a chair and tie the skein thus formed in several places with white cord. Boil out in soapy water, rinse well, and place on the chair in the sun to dry.

THE HOME CIRCLE

THE SUNSET LIMITED.

Oh, Hush-a-by Land is a beautiful place

For sleepy small people to go,
And Rock-a-Bye Route is the favorite one

With a certain wee laddie I know.

The track lies on sleepers of feathers and down,

No accidents ever take place,
Though there's only one track, and there's only one train,
But it runs at a wonderful pace.

There are beautiful things to be seen on this route—

If you're good you may take just a peep;

But strange as it seems, they are seen best in dreams.

Be sure that you soon go to sleep.

Say good-night to the Sun, for he's off to bed, too—

He can't hear you, so just wave your hand;

The Moon and the Stars they will light up the cars

As you travel to Hush-a-by Land.

So, quick, jump aboard, it is time to be off,

You have nothing to pay, you young elf;

Just think of the luxury, laddie, you'll have—

A whole sleeping-car to yourself!

—Booklovers Magazine.

SOUPS.

A very nourishing and pleasant addition to a meal is soup. Meat soups are heavier, but cream and vegetable soups are rich in nourishment. One of the essential things about soup is that it should be hot and that is more easy to accomplish since the soup tureen has passed out of favor. Now Soup is served in individual dishes direct from the fire and there is no excuse for it not being as hot as can be eaten with comfort.

At this time of year, the dried peas and beans are very satisfactory, for in many households the fire necessary is supplied by the kitchen range and they both require long, slow cooking. They should be soaked over night in plenty of water and the next day cooked until tender. Then rub through a colander and add milk, butter and seasonings. An onion cut in small pieces and added to the soup while the long cooking is going on, adds to the flavor.

A quick cream soup can be made by adding to a white sauce sufficient milk to serve and then adding either tomato that has been cooked and strained, or a can of corn, or hot mashed potatoes or creamed cauliflower. All of these cream soups need butter and careful seasoning.

DRIED PEACH RECIPES.

To Peel Dried Peaches.—Put desired amount of dried peaches in pan and pour boiling water over them; let stand on stove until the peeling slips off easily—about 20 minutes; remove the skins while still warm.

To Cook Dried Peaches.—Peel them according to above recipe, then wash thoroughly two or three times, add cold water and sweeten to taste. When cooked slowly, they are

almost like fresh fruit preserved.

Peach Dessert.—One pound peaches peeled; one-half pound sugar. Soak peaches one hour, then cook slowly until soft and add sugar. Drain and put through sieve and use as a base for half a dozen good desserts. One-half cup added to one can marshmallow creme and one-half cup of chopped raisins and walnut meats is delicious on crackers or as a cake filling.

Peach Tartlets.—Make a good pie crust. Invert patty pans and cover with crust. Bake and fill with peach dessert and cover with whipped cream.

For Breakfast.—Cream of wheat with stewed dried peaches added just before serving is excellent. Serve with cream.

Peach Butter.—Soak peaches over night in just enough water to cover, next morning put through meat chopper. Add enough water with sugar and cook one hour, stirring often to keep from burning. Add clove and cinnamon or cinnamon alone if preferred. Delicious with hot biscuits.

Dried Peach Cobbler.—One pint stewed peaches, one and one-third cups of water, one-third cup of sugar; put in pudding dish and let come to boil. Have ready the following batter and drop in, baking 20 minutes: One cup flour, one teaspoon baking powder, pinch of salt, one tablespoon sugar, one tablespoon butter, rub all together and add one-half cup of sweet milk. Drop into the boiling peaches and bake. Serve with cream.

CLEANING GLOVES AND FABRICS.

When using benzine to remove a spot on a silk skirt or any other article, there is much less danger of leaving a ring if under the spot is placed a cloth to absorb the surplus fluid and then the spot is rubbed dry with a clean cloth. The odor will leave sooner also, as there is less left to evaporate. Gloves are very much whiter if they are rubbed dry with a clean towel after being washed in benzine on the hands. The addition of flour to the benzine helps whiten them also, but they need to be dusted very carefully dry, or they will whiten everything they touch.

For home cleaning, a clear, sunny day should be selected.

BUSINESS.

"Business is poor," said the beggar. Said the undertaker, "It's dead!" "Falling off," said the riding school teacher.

The druggist, "O vial," he said. "It's all write with me," said the author.

"Picking up!" said the man on the dump.

"Business is sound," quoth the bandsman.

Said the athlete, "I'm keeping on the jump."

The bottler declared it was "Corking!"

"Makes both ends meat," said the butcher.

The tailor replied, "It suits me!"

—Implement and Vehicle Record.

Floral Department.

[By Geo. N. Tyler.]

You can plant the hardy perennials now. Get one-year-old field-grown plants, Canterbury Bells, Coreopsis, Lanceolata, Delphinium, Foxgloves, Gaillardias, Gypsophila, Zamculata, Golden rod (divisions), Golden glow (divisions), Hollyhocks, Oriental Poppy, Pentstemon, Shasta Daisies (divisions), Sweet William, Virginia creeper, Cannas (divisions). Also, get your pansy plants for early spring blooming, if you did not sow any last fall.

Now a few words on flats and seed planting, as it will soon be time to sow seeds of asters, etc., for fall blooming. Nearly all kinds of flower seedlings need transplanting. Therefore, it is best to plant in shallow boxes or in the soil of a hot bed. A box called a "flat" is what the florists and nurserymen use for planting seeds and for transplanting the small plants after they are large enough to handle. A flat is a box 26 inches long, 13 inches wide, and generally 3 inches deep inside. Get your strips of good redwood lumber, the ends cut in twelve-inch lengths, one inch thick, and three inches wide. The sides and bottoms are one-half inch long. A strip on each side and four on the bottom complete the box and the strips on the bottom are wide enough apart to give thorough drainage. The box is 24x12x3 inches inside measure, and holds seventy-two plants, planted two inches apart both ways.

Then take light rich earth, one part loam, two parts leaf mould, and one part pure sand. Mix thoroughly and run through a quarter-inch sieve. Some bake the prepared soil to kill weed seeds and larva of insects that may be in it. After you have filled the boxes with the prepared soil, firm it down with a brick or piece of board (I use a plasterer's trowel), then sow your seeds carefully and evenly and press them in with a smooth board and sift over them light soil, or, what is better still, pure sand, sufficient to cover them. Moisten them with luke-warm water, but use a fine spray so as not to wash the seeds. An empty tomato can, with the bottom punched full of small holes, is what I use.

If you have a hot bed or cold frame, or small green house, so much the better, but if not, place the box where there is but little light, but in a warm place, and cover the box with a newspaper. Let them remain thus for several days till the seeds have a chance to swell, before you give them much light. As soon as the seeds germinate, give them light and air. Remember in watering seedlings or seeds to do so in the morning with luke-warm water, and never at night or late afternoon, for the damp surface is liable to form a fungus, which will cause every plant to damp off, or rot at the surface of the ground. Never under any consideration use any kind of manure in the seed boxes for there is too much fungus in it.

Undoubtedly the after half of life is the best working time. Beautiful is youth's enthusiasm, and grand are its achievements, but the most solid and permanent good is done by the persistent strength and wide experiences of middle life.

Good Health.

[By H. E. Pastor, M. D.]

The Fad for Flannels.

Time was when nobody was thought properly clad in winter unless swathed in one or two thicknesses of flannel underwear and be-bundled in heavy woolen outer garments. Time was, too, when coughs, colds, sore throats, bronchitis, pneumonia, and tuberculosis were much more common than they are at pres-

Open Sundays and Evenings

ent. And the time when the heavy woollens were worn next the skin and outside it, and the time when these respiratory and pulmonary diseases were so rife, were about coincident. And there is a strong belief among many medical men today that the coincidence was not merely accidental, but that it bears the relationship of cause and effect.

Woolen undergarments (including stockings) may have their place in ministering to the comfort of babes, young children, the aged and infirm, or the debilitated of any age; but it is a grave mistake for the active and healthy to coddle themselves with this excess of warmth. The skin is a complicated structure, and is enabled by its own power of contraction and expansion of its blood vessels to protect itself against cold, and to throw off an excess of heat (transpiration assisting in the latter process).

Besides diminishing the natural resistance of the body to cold and disease, one of the severest indictments that can be brought against woolen underclothing is its fateful property of absorbing and retaining perspiration. As a result of the overheating of the body perspiration is easily started. The moisture absorbed by the woolen garment is held, and when bodily activity ceases the woolen fabric becomes a cold, clammy thing next the sensitive skin and severe congestions result. Cottons, linens and silks part with the moisture taken up much more quickly, and in that respect are to be preferred. In the mild temperatures that prevail in California's valley and foothill districts scarcely any change of clothing from season to season is necessary among the well; and among the more intelligent the fad for flannels is happily passing.

Handle It Gently.

The skin of the infant is very tender and calls for special attention on the part of mother or nurse. Only the blandest soaps should be used in the bathing, and the drying of the parts should be effected by careful rubbing with a soft towel. If there is any abrasion or chafing, bran water may be substituted for the plain water. This is prepared by placing two or three cups of bran in a piece of coarse muslin or cheese cloth and squeezing it into the bath water until it becomes slightly thickened. It acts as an emollient. Parts of the body that are frequently wet or soiled should be cleaned as soon as noticed and the napkin renewed. If the chafing becomes severe use a little sweet oil on absorbent cotton to cleanse the surface, and then dust over with oxide of zinc, or a preparation composed of starch and boracic acid half and half, or the prepared talcum powders sold in drug stores.

Value of Deep Breathing.

Deep breathing is an absolute necessity to abounding health. There is always a residuum of stale air left in the lungs after the act of expiration. A special effort should be made at intervals to expel as much of this residual air as possible. Replace this with fresh air drawn into the lungs in deep breaths. Deep breathing should be practiced regularly by all. It is only when fresh air is inhaled in full breaths that all

FANCHER CREEK NURSERIES

446 Holland Bldg.,

Fresno, Cal.

Geo. C. Roeding, President and General Manager

the cells of the lung tissue are filled with this vitalizing fluid. Many persons of both sexes, but more especially women and girls, of inactive temperament, never have the upper part of the lung tissue adequately inflated, if inflated at all. It is here where the symptoms of that dread disease, pulmonary tuberculosis, (consumption) first make their appearance, and mainly for the reason that the function of this part of the lung structure of supplying oxygenated air to the depleted blood flowing through its capillaries, is neglected. This lung substance thus undergoes a sort of atrophy, or wasting away, and becomes easily susceptible to disease invasion. Therefore, not only make deep breathing in the open air a special exercise at

intervals of the day, but cultivate the practice of deep breathing habitually. Few simple things contribute more potently to the maintenance of the general health.

The Sense of Taste.

Try to have all foods and beverages agreeable in flavor. There is an intimate connection between the organs of taste and those of digestion. Insipid food substances, no matter how intrinsically nutritious, are not readily assimilated. The sense of taste is not a mere palate-tickler.

We are all born with passions; they are part of our very being. Don't try to repress them; the effort is futile and undermines the health. Try to control them.

SAN FRANCISCO.

San Francisco, Jan. 31, 1917.

WHEAT.

A slow call has ruled the local market, with values generally unchanged. Eastern markets have shown a tendency to weaken, as peace talk and renewed rumor of diver activity have tended to hold trading down. Local holdings continue light.

Senora wheat	2.75@2.80
Northern club	2.70@2.75
Calif. club, ctt.	2.60@2.65
Northern Bluestem	None offered
Northern Red	None offered

BARLEY.

Spot trade in barley has been at a standstill, owing to the cleaned up condition of this market. Seed sold in larger quantities the past week at steady prices. Brewing barley is in limited demand and hard to move, but feed barley continues firm.

Seed, ctt.	2.50
Shipping, ctt.	2.35@2.40
Brewing	Nominal
Choice feed, ctt.	2.25@2.27½

OATS.

A strong demand and moderate sized stocks were contributing factors in advances on both red feed and white oats.

Red feed	\$1.85@2.00
White	2.25@2.50

CORN.

Delay in delivery of Eastern stock has brought firmer prices. All of the other varieties of corn rule firm while a small advance on Egyptian has occurred. Cleaning up of the poor stock on hand brought this change.

[First-hand prices on strictly first-class grain, San Francisco.]

Eastern Yellow, ctt., bulk	\$2.15@2.22½
California, sacked	2.20@2.25
Mid. Maize	2.00@2.20
Egyptian	2.25@2.50

BEANS.

No material changes in beans are reported for the past week, trading in this line having been rather slow. Limas were in somewhat better call and blackeyes have advanced about twenty cents per cental. It was reported that southern holders of Limas were asking as high as \$8.25 but the highest local quotation was \$8. Eastern inquiries for this variety are still being received, but most parties balk at the prices asked.

[Uncleaned, on wharf, San Francisco.]	
Bayos, per ctt.	\$5.75@6.00
Blackeyes	4.40@4.60
Cranberry beans	6.50@6.75
Horse beans	7.00@7.50
Small Whites (south)	7.00@7.50
Large Whites	8.10@9.50
Pinks	6.90@7.10
Limas (south)	7.85@8.00
Red Kidney	9.00@10.00
Mexican Reds	6.50@7.00
Tepary beans	5.90@6.00

HAY.

While a firm market is reported, sales have fallen off here to a very noticeable degree. The cold dry weather in the country compels feeding on a still larger scale than reported last week and withdrawals from up-State warehouses are very heavy. It is generally conceded that the old crop will be practically cleaned up before new hay is available and this has caused present holders to ask better prices. Dealers are buying all available stock in interior districts and the prices paid are said to have ranged very high for the quality purchased.

[Price per ton, carload lots, San Francisco.]

Wheat, No. 1	\$17.00@19.00
No. 2	15.00@17.00
Tame oats	14.00@19.00
Wild oats	14.00@16.00
Alfalfa	14.00@17.00
Stock hay	13.00@14.00
Straw, per bale	.70@.90

FEEDSTUFFS.

Feedstuffs are still in heavy demand, and prices generally range from steady to firmer. The one exception is middlings, some lower grade stock being offered as low as \$37.00 per ton here.

[Per ton, San Francisco.]	
Beet Pulp, per ton	\$20.00@21.00
Alfalfa meal, per ton	21.50@22.50
Bran, per ton	30.00@31.00
Oil Cake	40.00@41.50
Cocoonut cake or meal	31.00@32.00
Cracked corn	47.00@48.00
Middlings	37.00@40.00
Rollad Barley	46.00@47.00
Tankage	47.00@48.00
Rollad oats	46.00@47.00
Rice middlings	33.00@34.00

POTATOES, ONIONS, ETC.

Still higher prices on potatoes and onions have been features of the past week. The general price on good deltas is \$3.00 per cental and some holders are asking higher. Ice-house onions are being held at \$8.00 per cental with street sales at \$6.00@7.25. Offerings of green vegetables are still of secondary importance in the market. A few southern tomatoes that are not badly frost bitten are being offered and selling at 75c@1.25 per crate. Lettuce is lower under increased arrivals with celery and rhubarb about unchanged.

Lettuce, crate	\$1.00@1.50
Celery, Delta, crate	2.90@4.50
Tomatoes, crate	.75@1.25
Rhubarb, box	1.30@1.50
Potatoes, ctt., Delta	2.50@2.75
Saltinas	2.75@3.00
Oregon	2.50@3.00
Onions	6.50@7.25
Garlic, lb.	.35@.40

POULTRY.

California receipts still fall short of supplying local demand, but arrivals of Eastern stock have been enough to prevent any sharp advances. Interior shipments for the past week have run largely to young fowl with the result that earlier prices are noted

on fryers, broilers, and young roosters. On the other hand, the market is insufficiently supplied with hens and quotations on this line have stiffened under a good demand.

Turkeys, dressed, large, lb.	26@28c
Turkeys, live, lb.	24@25c
Young, large	26c
Broilers, 18 lbs to doz and less	28@30c
do. over 18 lbs. to doz	25@27c
Fryers	24@26c
Hens, extra, per lb. colored	20@22c
Small leghorn	18@20c
Smooth Young Roosters, per lb.	
(3 lbs. and over)	22@25c
Geese, per lb.	18@20c
Squabs, per lb.	40@43c
Ducks	20@22c
Old	20c
Belgian Hares	12½@14c

BUTTER.

Continued light arrivals are responsible for a very firm undertone in the butter market. An added factor in this firmness has been the general advance on butter in the Eastern markets and the sudden demand for butter at Los Angeles. For some unknown reason, the southern city has been so anxious to get stock that on several days of the past week the Los Angeles quotation on butter has been above the San Francisco figure. A few small lots of butter were sent to the Northwest this week as a result of a three-cent advance in the price of butter at Portland. Arrivals during January were 1,388,200 pounds.

EGGS.

A partial reaction from the sharp declines of last week has served to hold egg quotations about steady. The pick-up in the retail demand as the result of lower prices and the outside call has cared for heavier receipts. Three cars were sent to New York and Chicago and nearly a car to Salt Lake City. The first shipment of eggs, 180 cases, from the newly organized Central California Poultry Producers' Association reached here Tuesday and the stock was divided between three houses by the Association's agent. Arrivals during January were 1,500,870 dozen.

Special Citrus Market Report.

Shipments of citrus fruit from Southern California from November 1 to January 28: Oranges 4831 cars and lemons 191 cars. Same time last year, oranges 2967 cars and lemons 1249 cars.

Shipments from Central California from November 1 to January 28: oranges 3931 cars and lemons 139 cars. Same time last season: oranges 4128 cars and lemons 111 cars.

The Eastern markets showed a little more strength and all good highly colored oranges met with a very good demand and the more popular brands brought a little more money. Poor fruit, however, was slow sale and showed no improvement. Lemons were in light supply, better demand and higher East. Locally the market remains much the same as a week ago. Local packers bought sparingly and confined their purchases mainly to the larger sizes of highly colored oranges. The free offering of culls, which have to be sold for what they will bring, working against the general market. The best oranges are still being bought at 1c per pound in the orchard picked, grapefruit in fair demand at 2c per

pound in the orchard picked. Tangerines slow sale at 1½c per pound in the grove picked. Lemons dull at 1½c per pound in the grove picked, for the best. Poor have to be sold for what they will bring. Offerings only moderate. While the crop of navels is said to be a good one, it is not thought to be burdensome and there is a feeling that all good fruit will continue to meet with a very fair demand.

AUCTION SALES.

New York, January 29.—Twenty-five cars navels and one car of lemons sold. Oranges firm and lemons higher. Weather cloudy. California navels averaged \$1.55@3.40. Lemons averaged \$2.80@3.25.

Boston, January 29.—Fifteen cars sold. Market easier on oranges; stronger on lemons. California navels averaged \$1.65@3.00. Lemons averaged \$2.15@3.45.

Philadelphia, January 29.—Three cars sold. Market firm on oranges at prevailing prices. Higher on lemons. California navels averaged \$1.95@2.45. Lemons averaged \$3.05.

1917 Figs Sold.

The California dried fig market is fairly booming, and some packers estimate that about 75 per cent of the 1917 crop of Calimyrna and white Adriatic figs around the Fresno district have already been bought and sold again by the packers, being now owned in the East; while black figs are being steadily bought up.

The movement here is based rather on an urgent demand from the East than on information as to future prospects possessed by local interests. Eastern buyers apparently have a well-founded belief that the shortage of fig importations will continue, and have been offering high prices for all the white figs they could get, wishing to be certain of covering their requirements. This has resulted in an advance to 7½c for white Adriatics and 11c or perhaps a shade higher for Calimyrnas.

Spot figs have long been cleaned up, as the Smyrna market was closed last year, and only about 7,000 tons was brought in, under great difficulties. A good sized lot of inferior Portuguese figs, fit only for bakers' use, was brought in; but this relieved the shortage very little, as there is ordinarily about 25,000 tons imported. The California crop is a very small part of the entire requirements of the country.

A good-sized tonnage of the California crop was contracted somewhat below present quotations, but the growers have been taking a firmer stand for the last week or two, and most of those who have not sold are holding for more than is yet offered. As the amount still available runs into no very great tonnage, and mostly in the hands of a few large growers, it will probably be very closely held.

HOPS.

Prices on hops are weaker, due more to a lack of first quality offerings than any let-up in the demand.

HIDES.

Almost the entire hide list has suffered a decline within the last week, buyers apparently not caring to purchase heavily at this time. Peace talk has brought a lull in the Eastern market and local traders are marking time until something more definite is learned from that source.

GROCERIES.

Few changes of note are reported in the grocery list. Sugar has apparently settled down at \$6.75, granulated basis. A few brands of olive oil have been advanced and one firm announces an advance on spice, to take effect on March 1.

LOS ANGELES.

Los Angeles, Jan. 30, 1917.

BUTTER.

Receipts of week ending Jan. 30, 1917—250,002 cases.
Receipts of week ending Jan. 30, 1916—301,650.

A dropping off in the receipts and light production and the stocks of cold storage butter much lighter than a year ago, all encouraged higher prices the past week. Consumption, too, holds up well notwithstanding the high prices compared with a year ago. Extras selling now on this market 13½c higher than this time last year. Extras advanced here 2c up to Monday and San Francisco the same, while in Chicago extra is 1½c higher and in New York 2½c higher. The government report from 227 cold storage warehouses Jan. 1 showed a shortage of 4,303,683 pounds compared with the same date last year and the February report is expected to show a much heavier reduction.

Tuesday under light receipts the market showed further strength on call. Extra was bid for at 40½c and no sellers.

Receipts (railroads) for week ending Jan. 30, 1917—1370 cases.
Receipts (railroads) for week ending Jan. 30, 1916—870 cases.

There has been but little change in this market from a week ago. Receipts were much heavier than for some time and buyers were inclined to be bearish. The lower prices encouraged consumption and packers were very good buyers at the lower range of prices. San Francisco as well as Los Angeles showed no change up to Monday, while Chicago declined 1c and New York was steady with a week ago. Buyers failed to bid prices up until Tuesday when they were advanced 1c and are 7½c higher now than this time last year.

HONEY.

It was very quiet in this market the

Tomato Industry Growing.

The California tomato acreage, which was greatly increased last year, promises to grow still further this season, in response to an exceptionally strong demand and high prices. Last year's pack, though greatly curtailed by bad weather in the fall, was much larger than the previous year, and is estimated at about 1,750,000 cases. This cleaned up very quickly, and a great shortage developed later in the season, in view of which prices advanced from very moderate to extremely high figures. The advance was due to various causes: the shutting off of imports from Italy, which had formerly supplied a large part of the New York trade; unfavorable weather in the East, and lack of fertilizer, which seriously shortened the Eastern crop. The consumption, also, was larger than usual. Owing to the shortage the canneries in parts of the Bay district paid as high as \$12 per ton toward the end of last season, compared with \$8 early in the season.

The Eastern shortage and low rates by the Gulf route placed California tomatoes in the New York market, where they had never appeared before, and they have found a great deal of favor, especially with the Italian trade, which uses large quantities. As a result there is a strong demand again this season; and the trade looks for another year of short production in the East, with Italian imports cut off, which will give the California stock a good field. The leading packers named opening prices for the 1917 pack at 95c per doz., compared with 70c for the 1916 pack, and it is understood that advance orders have been booked at this price which will cover the entire pack. This of course warrants higher prices to the growers; but other expenses have advanced. Cans alone are about 15c per doz. higher, and other expenses make the increased cost, exclusive of raw tomatoes, about 20c per doz. cans. The packers have been actively contracting for the new crop, offering \$9 to \$10 in the Bay district, compared with \$8 in Santa Clara Valley last year. In the interior, where more freight must be paid, prices are of course much below this. At these prices, the packers now state that they have secured fully their normal acreage, and with a good crop they will have all they can handle; though there are reports from the country of continued inquiries for acreage. There have been rumors of offers as high as about \$12 in well-situated districts, but such propositions appear to have been only tentative. At any rate, the canners deny that they have made any such offer, and the leading interests name \$10 as the outside figure. Owing to the high prices, packers believe there will be serious danger of overproduction of tomatoes next year.

past week. There was very little demand for either extracted or comb, but as stocks are light old prices were fully sustained and holders rather firm in their views.

We quote from growers:
Water white, pound7½c
White sage, lb.7½c
Light amber sage, lb.7c
Light amber alfalfa, lb.6½c
Fancy white comb, lb.10c
Light amber comb9c
Beeswax30c

BEANS.
There was a little better movement the past week. Receipts were only moderate and limas are higher. Buyers were inclined to take hold more freely than any time since the opening of the new year. Blackeyes were more quiet than limas and whites, though they too met with a fair demand.

We quote from growers:
Limas\$8.00@8.25
Large white10.00@10.50

Small white10.00@10.50
Pinks7.25@7.50
Blackeyes5.25@5.75
Tepary5.75@6.25

HAY.
There was a little more doing in this market the past week. Receipts were not heavy though they showed quite an improvement over the week previous. Grain hay made up a good percent of the arrivals and was dull, while alfalfa met with a very good demand. Local buying was only moderate, though there was a very good shipping inquiry from nearby points. The reserve stocks in the country seem to be light, especially of alfalfa, which encouraged country buying. Prices steady and rather firm of alfalfa.

We quote f. o. b. Los Angeles:
Barley hay, ton\$18.00@29.00
Oat hay, ton19.00@21.00
Alfalfa, northern, ton16.00@17.00

Ewes7½@8c
Lambs11½@12½c
HOGS are not being offered as freely, a falling off of fully 30 per cent having been realized in the past week. A few soft hogs are finding their way to this market but are being docked 2½ to 3 cents a pound when slaughterers are compelled to take them. All grades are quotably higher, "packers" bringing 10½ cents.

[Rough, docked 20 pounds, piggy sows, 40 pounds, stags 30 pounds.]
100 to 150 lbs.8¾c
150 to 300 lbs.10¼@10½c
300 to 375 lbs.9¼@10c

Wool buyers are still keen to do business, the center of activity so far as country buying is concerned having moved to San Joaquin Valley points although there is still activity in the Red Bluff section. Nevada clips are said to be about all contracted for at this writing. From reports in the country

our quotations are not as high as conditions would seem to warrant but it is difficult to establish higher ones at this market. Boston wire says "wool market continues quiet but sales, when made, are at strong prices." Sacramento Valley, spring clip, 22@30c; Mendocino, year's32@33c; Southern, spring clip26@28c; Southern, 7 months13@16c; Imperial Valley, 7 mos.14@15c; Nevada, year's31@32c

HIDES.
Nothing new has developed in this market. Our quotations are changed on pelts, Kip and calf hides.

Buying Future Prunes.

Many rumors are current as to offers for 1917 prunes. In most cases it is apparent that the packers are merely feeling out the views of growers, as very few reports of firm offers can be verified, and most packers in San Francisco declare that they are unwilling to take such a gamble as purchases of prunes so far ahead would involve. Several thousand tons, however, have been contracted in the Santa Clara district by at least one house, at about 5c.

This is attributed in part to the desire of the buyers to cover their requirements well in advance; but the movement seems to be due partly to a desire to interfere with the formation of the new Association; especially as many growers have reported provisional offers, or at least suggestions of offers, as high as 5½c on long-term contracts, on condition that the Association movement falls through. Most packers in San Francisco profess entire ignorance of such offers being made; and comparatively few growers have been willing to consider any such propositions.

From present appearances, the prune situation is extremely strong. There are not over 8,000 or 9,000 tons left in the State, probably less, against 17,000 tons a year ago; and that amount was closely cleaned up before the new crop appeared. The stock is practically all in packers' hands; only two or three large blocks remaining with growers. While present trade demands are limited, with jobbers buying from hand to mouth, there is no indication of curtailment of consumption. Domestic requirements are sufficient easily to clean up what is left at full prices; and whenever the war ends an enormous foreign demand is expected. Packers are offering about 6c for spot prunes, with perhaps ½c premium for choice lots in small sizes.

No. Portland, Ore., Jan. 29, 1917.

BEEF STEERS: Today's trading in the beef steer division was very active especially on all good to prime grades. Prices were a good 25 cents higher on all prime beefs while ordinary to good grades scored a 10-15c advance, tops selling for \$9.00. Good steers realized from \$8.25 to 8.50; medium grades brought around \$8.00. Ordinary beefs are meeting with but little call from packers.

COWS AND HEIFERS: The supply of cows here this morning was light, with a good demand for fat stuff. One lot of Idaho cows realized \$7.75, with a number of small bunches at \$7.50. Fair to good kind brought \$6.75 to 7.00. Medium and ordinary dairy types from \$4.50 to 6.00.

HOGS: Hog values on the North Portland market this morning bounded to within 15 cents of the record prices of 1909 when another big 25-cent advance was made on all grades. One load of prime medium weight porkers crossed the scales at \$11.35 with the bulk of the good hogs bringing \$11.25. Ordinary kinds sold down to \$11.00, of which there was a good-sized spread. The pig supply is rapidly diminishing and the price along with others advanced 25 cents, the bulk bringing \$9.75.

SHEEP: Arrivals for the day were in goodly numbers. The demand for both sheep and lambs is large; an unlimited amount can be taken care of. Quotations on all sheep were advanced again this morning, prime east of mountain lambs bringing \$12.10@12.25. Best yearlings were quoted \$10.25 to 10.50; with wethers from \$10.00 to 10.25. Good mutton ewes are quotable at good 50 cents higher at \$9.00 to 9.25, for prime stuff. Prime shorn lambs are realizing \$10.00 to 10.25.

Los Angeles, Jan. 30.

CATTLE: A firm market and very good demand was had the past week for all good killing steers and fat cows. The advance of last week was fully sustained. California and Arizona furnished most of the supply and what cattle coming in very good condition. Eastern markets continue high and very good beef market was had, which caused killers to bid up well for everything that suited.

Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs. \$8.75@9.00
Prime cows and heifers7.00@7.25
Good cows and heifers6.50@7.00

Quotations f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs. \$8.75@9.00
Stockers and feeders5.50@6.00

HOGS: Not so many in the past week and the market was firm for good mixed packing and lights. But while killers bid full quotations there was no disposition to advance prices. California and Arizona furnished most of the supply and some very good hogs. But few Idaho hogs in, most of them being drawn East by the high prices there.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300 lbs.\$9.25@9.50
Mixed, 200@250 lbs.9.25@9.50
Light, 175@200 lbs.9.25@9.50

Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP. Last week's advance was fully sustained and lambs were bid up another 50c per head. A fair number of both sheep and lambs were in, but the supply was light for the demand, causing a very firm market. Utah and Arizona furnished most of the supply with a few from Idaho. More could have been disposed of if here. Killers all buying both of sheep and lambs.

Per head f. o. b. Los Angeles.
Prime wethers\$8.00@8.25
Prime ewes7.50@7.75
Yearlings7.50@7.75
Lambs7.50@8.00
CALVES: Offerings light and market firm. Demand good for what few coming in. Selling at \$8.50@9.50.

MISSION OLIVES

EARLY RIPENERS

THE EHLMANN OLIVE CO.

Oroville, Cal., Nov. 17, 1916.

Mr. W. A. Hayne, Box 461, Marysville, Cal.

Dear Mr. Hayne: Answering your kind favor of the 15th, I am enclosing herewith photograph of some of this year's fruit on the Fogg grove, and you will note that they are above the average Mission. We also were able to harvest this entire crop before the frost, which shows that they are early ripeners.

We will be glad to keep in touch with you on this matter, and if we can be of any further service, don't hesitate to let us know.

Yours very truly,

I propagated the Fogg orchard thirty years ago. The origin of the Fogg trees was directly from the old Mission at Santa Barbara. The trees I have now for sale are full brothers to the Fogg olive tree, and like the Fogg trees, they are all propagated from the large size cuttings.

W. A. HAYNE.

Harrow Buying Made Easy

HARROWS that do the best work and last longest cost so little that there is no economy in buying any but the best. A post card will bring you complete information about International Harvester disk, spring-tooth and peg-tooth harrows. Write the card now and mail it as soon as you can.

In the line there are bumper disks with rigid frames, four-wheel bearings and gangs that are level at every cutting angle. Also disk harrows with independent gangs that can be used for side hill work and for filling dead furrows as well as on level fields. For wet, cloddy fields we have spring-tooth harrows with teeth that cannot work loose and that can be set to any desired cutting depth. Our smoothing harrows have square teeth that cannot twist, and stiffening bars that keep all the teeth at the same cutting angle regardless of extra strain put on any single tooth. Riding attachments and other special features can be furnished for all spring and peg-tooth harrows. We have also a complete line of one and two-horse cultivators.

This spring you will need tillage implements, harrows or cultivators. If you want the best your money will buy, write that post card today and mail it.

Canadian Farmers Profit From Wheat

The war's devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and wheat near \$2 a bushel offers great profit to the farmer. Canada's invitation is therefore especially attractive. She wants settlers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops.

You can get a Homestead of 160 acres FREE and other lands at remarkably low prices. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to acre. Wonderful crops also of Oats, Barley and Flax.

Mixed farming as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent.

Military service is not compulsory in Canada, but there is an extra demand for farm labor to replace the many young men who have volunteered for the war. The Government is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or

Do It Electrically

ELECTRIC APPLIANCES in the household, not only add to the convenience of all members of the family, but they are economical and time-savers.

ELECTRIC APPLIANCES include CHAFING DISHES, COFFEE PERCOLATORS, VACUUM CLEANERS, ELECTRIC IRONS, and every other appliance that is needed in the modern home, not forgetting **ELECTRIC FANS.**

We carry these appliances in many of our branch offices, and will be glad to have you call and inspect them. Where we do not carry them we will be just as glad to give you our expert advice.

"PACIFIC SERVICE" is always "At Your Service."

Pacific Gas and Electric Company

HEAD OFFICE, 445 SUTTER ST., SAN FRANCISCO.
Branches in all principal cities and towns of North Central California.

DEEP WELL TURBINES

No valves to pack or plunger rods to get out of order. For use in any well ten inches in diameter or over.

A complete line of irrigating pumps of all descriptions, horizontal and vertical for belt drive or direct connection to electric motor.

Prices as low as are consistent with good quality and workmanship.

California Table Poultry and Brown Eggs.

[Written for Pacific Rural Press.]

IN THE opinion of three of the largest handlers of poultry, the methods of marketing poultry in California have been crude and wasteful because it has been customary for fowls to pass through from four to six hands after leaving the producer before reaching the ultimate customer. However, during the past two or three years improvements have gradually been made, and at present a fair percentage of the fowls marketed in the large cities now pass through only two or three hands and the fowls are of a much better quality, more attractively dressed for market and sorted into uniform grades. These improved methods have encouraged the increased production of the heavier birds, most of which lay brown eggs. Not only has the producer been benefited because of an increased and steadier price for table fowls, but the increased production of choice brown-shell eggs has awakened a keen demand for these colored eggs when they are delivered perfectly fresh, of even size and uniform color. In regard to the marketing of eggs in San Francisco market, those produced by the members of the newly organized Poultry Producers of Central California, Incorporated, comprising the output of about 1,500,000 hens, will be sold through members of the San Francisco Wholesale Dairy Exchange. This association is represented on the Exchange by a member who may exercise at any time the right to buy in the eggs when he considers it may be to the best interests of the producers.

It is reported from Los Angeles that the eggs from the Poultry Producers of Southern California, Incorporated, have been contracted by one firm. The handling of eggs commercially is thus largely provided for during the coming year.

In San Francisco the handling of poultry has attained large proportions. Three of the largest firms were interviewed and the following statements from them give a very fair insight into the present situation:

Prices Advance with Increased Production.—Higher prices are now being paid for table poultry than ever before in the history of California, states V. O. Harbaugh, of Harbaugh & Co., who handled 3,400,000 pounds of poultry during 1915, and that about 90 per cent of the poultry arriving in this market are broiling or fricassee chickens, making a shortage of other classes and the high prices that prevail. But there has been a noticeable increase in the larger breeds of the Pacific Coast, and at the present rate of increase of these larger breeds all shipments of live poultry from the East will be eliminated within the next three or four years.

What the East Sends Us.—There has been an average of about 300 cars of live poultry, consisting of the larger breeds, such as Plymouth Rocks, Rhode Island Reds, etc., shipped here each year from the East. This does not include the chilled or frozen poultry shipped from the East, which amounts to approximately 100 cars per year. During the last year there were shipped here from the East approximately 5,500,000 pounds at an average price of 20c per pound, and approximately 2,000,-

000 pounds at 22c per lb., all of which could have been produced in California if special effort had been made to the raising and culture of large breeds. This represents in money over \$1,500,000.00.

One reason that Eastern poultry is quoted in the market as selling higher than our California birds is that all Eastern poultry is grain-fed on the farm, and while en route on cars they are similarly fed on cereals and condensed buttermilk diet, which places them in the best condition when offered for sale on the market. If our local poultry raisers would put their poultry through the same fattening process before offering on the market the results would be much better and the quality of the poultry brought up to a standard.

Increased Production of Large Breeds.—W. E. Coleman, manager of

the California Poultry Company, states that the increase in production of the larger breeds of fowls in California during the last year was about 300 per cent and that this State will soon rank first in production of these larger fowls. The average person in speaking of poultry seems to have in mind the production of eggs and does not realize how large is the poultry industry in this State when viewed from the standpoint of poultry for table use. The present demand for table fowl is mostly for fricassee or roasting chickens. There should be a much stronger present demand for broilers, but Mr. Coleman says that the general public does not know there are broilers at this season of the year. Broilers bring the highest prices per pound.

Modern Crate Feeding.—Regarding crate feeding or fattening of fowls for the market, he states that the average raiser of poultry has not the facilities to do this properly, and advises the shipping of country raised or range chickens to market to be crate-fed or fattened, where it can be done by the most modern methods. When fowls are fattened on the farm for the market, the flesh is naturally soft and the shrinkage during shipment is considerable; especially is this true in shipping young ducks. The country or range-fed fowls stand up better during shipment; but the young farm-fattened birds cannot stand the journey.

Brown Eggs Now Popular.—He also states that one of the former reasons why the poultry producer

of California did not raise more of the larger breeds of fowls was that there has been more or less of a prejudice against the brown egg which is laid by most of these larger breeds, such as the Plymouth Rock and Rhode Island Red. The cause of this prejudice was due to the fact that there were not a great many of these larger fowls raised in this State, consequently these brown eggs were shipped in from the East, and when not carefully candled the public received some of these eggs which were far from being up to standard. Now that California poultry raisers have gone more extensively into the production of these larger breeds of fowls there is no reason why the brown egg should not command the same price and arrive in the market strictly fresh. The matter of allowing

IF WE SHOULD GO TO WAR.

ACCORDING to the humor or heroism of one's habitual outlook upon the affairs of life, the assumption by the United States of a warlike attitude toward Germany has different aspects.

To the one humorously inclined our nation becomes the big, fat boy who has no mastery of his fists, but whose tender heart forces him to lay soft hands on two belligerent kids, supplicating them to "fight fair," until he gets so many vicious punches in the ribs that he has to turn his back and protect himself by placing the weight of his smooth posterior curves upon the offender. Memoirs of boyhood convince us that there is no better way to vanquish a crazy fighting kid than to sit on him—if you have weight enough. We imagine this will be the manner of our war with Germany—if it should come to that.

To one of heroic thought, such a picture is, of course, an insult to the proper conception of our birthright and function as a nation. To such a one there now arises an opportunity by which the United States, having demonstrated for a century and a half the practicability, profitability and humanity of popular self-government, shall stretch forth a heavy hand to smite the world's latest and perhaps greatest embodiment of absolutism, tyranny, and inhumanity, the Hohenzollern-Hapsburg combination of Central Europe, and draw their subjugated peoples out from overhanging clouds of oppression to the blue sky of self-government, for which their wonderful intellectual and industrial attainments fully qualify them. In such heroic thought, the United States of America will be beneficent father to the United States of Europe.

OUR DUTY IN THE MATTER.

WHETHER one takes the humorous or the heroic aspect of the matter, our duty is the same. Whether it is for us merely to sit on the lid, or to catch as catch can in a struggle, we must prepare to sit tight or catch hard. From an athletic point of view we are overweight, unwieldy and soft. We must go into training at once. Perhaps, also, we have indulged so long in the joy of thinking humanity better than it is, that we have become too tender-hearted and have given so much consideration to the ambitions and aspirations of all men as pure and sincerely actuated by emotions for the good of all mankind, that we have lost that hatred of absolutism and class-domination which made our forefathers such a power in the world. But the physical, intellectual, and moral strengthening and stiffening of the United States will be the burden of written and spoken eloquence in this country from this day forward, by all who wield powers in those lines, and this writing need not try to pursue them.

THE CURE FOR HYPHENITIS.

THERE is one thing which gives us joy and confidence, and that is that this cloud of war, whether it prove silvery or fiery, will lead this country to greater unity and strength

in pursuit of its manifest destiny. The outbreak of the European war disclosed the fact that we had people who were with us but were not of us. For some reason or other, some of them choose to live and prosper in a country governed for the people, but, in their cases, not by the people. Others choose to participate in the government and opportunities of this country, but not to imbibe its spirit. When the founders of this nation proclaimed its function to give a real chance in life to the oppressed of all nations, they could have had no idea that people would ever think of exploiting this country while still holding in their hearts loyalty and worship for dynasties from under whose domination they desired to rescue their bodies and their life-laborers. The conflict between European nations disclosed the fact that we had numbers of un-American persons posing as American citizens, and that we also have numbers who have lived as though they wished to avoid the burden of citizenship in any country. Fortunately, the threat of war is awakening all such people to their duties to leave no doubt whatever as to their manhood and their recognition of the fact that when they swore allegiance to this country they also swore allegiance to any other. Those who are joined in associations with names linking American with hyphens to other world alliance, are hastening to declare that they are Americans, first, last, and all the time in loyalty and patriotism. Thus, at the very first hint of a warlike state, we are winning a great victory at home. It seemed to need a threat of conflict to demonstrate to the world that the United States is not a great aggregation of heterogeneous peoples, from which all old powers could recall their contributions, but a thoroughly organized and unified people, whose solidarity and spirit were American because they love the principles of freedom for manhood upon which this country was established and for which it continues to exist.

HOW IT WORKS.

LET the reader suspect that this passing of the hyphen, by the laying-on of patriotic hands during a crisis which compels choice, is rather fanciful than real, we hasten to the demonstration. As we write, there is only a cloud of war, and yet there is a rush of citizens of recent or remote escape from foreign yokes to declare their attitude toward the nation which they or their ancestors chose out of all the world for their home and country. This is a significant item in the current news from Portland, February 5th:

"German-American citizens of Oregon had planned a celebration and entertainment in honor of the Kaiser's birthday, but when 1500 of them assembled at the German House they found it decorated entirely with American flags, all German costumes discarded, and German national songs eliminated from the program.

"William Rechmann, chairman of the committee on arrangements, told those assembled that the purpose of the meeting had been changed, and that it would be for the German Red Cross. English was spoken by most of the speakers, and when 'America' was played by the orchestra those present rose en masse and sang with a will."

This shows a fact which no one should have ever doubted, that Americans of German extraction are just as good Americans as there are. Doubt was, of course, engendered by the antics of a few recent immigrants, who were infected with Kaiser-worship—but that has now gone by. The Portland Germans sang in English, and sang lustily, because they knew full well there was no requirement to do so. They spoke and sang in English because it is the prevailing language of their chosen country, and is now their language and the language of their children. They sang the language of their newer and superior love and loyalty. Thus our first victory in the possible war with Germany is won within our own territory and citizenship. It is a victory which makes for everlasting peace.

SWEET LAND OF LIBERTY.

AS ALL Americans are not expected to think alike, the same freedom of thought belongs to the hyphenated as to other varieties of them. It is, therefore, perfectly right for Ger-

mans of San Francisco to differ from Germans of Portland, if they so desire. We judge they do differ, if the statements of a morning paper are accurate. It seems that on Monday evening the German-American League met in this city, and after discussing the international situation, adopted the following:

"To the Hon. The President of the United States: "The Executive Officers of the German-American League of California, assembled at the German House in San Francisco, urgently request your Excellency to submit the question of declaring war to a referendum. Thus, we are sure, a way will be found to keep our beloved country out of the hellgates of war."

"H. F. Budde, Sec."

"John Hermann, Pres."

The Americanization of our Teutonic brethren is clearly shown by their desire to hold an election: it is a perfectly American recourse. But the impracticability of the proposition is seen in the fact that President Wilson cannot be sure whether he should call this election in this country, or in Germany. We piously believe that such an election, held in either place, would close the gates of hell upon the makers of this war—providing such election was held in an American and not a Kaiserliches way. But as we write on Tuesday a dispatch comes that the Kaiser "will probably declare war on the United States tomorrow." As we cannot stop our press for the Kaiser, or the President, or anybody else, we cannot wait to see this thing out. At this moment, however, it does seem as though the election to save us from war would have to be held in Germany.

DID NOT KNOW IT WAS LOADED.

WE ARE writing of a matter which may unfortunately become serious, but while it appeals to one as a sort of diplomatic joke that the United States should be at real war with anybody who can fight, we may write somewhat lightly of it. We have been incubating peace pigeons in this country so long, it seems incredible that we could hatch out a war eagle—though that depends upon the egg rather than the hatchery, of course. We are not sure that the Germans do not also consider it a joke, by the comments which the wireless brings from them. Against this surmise, however, comes their traditional inability to see a joke after four o'clock, even by turning back the clock an hour to get more daylight on it. For the wireless brings from Berlin this very humorous statement:

"The general feeling in Germany is regret that the American President gave to the German note an interpretation which was not intended by Germany. The German measures are not intended to damage neutrals, but were caused by the necessity of defending Germany against hostile measures, which are contrary to international law—Germany's enemies therefore being charged with the whole responsibility."

Thus it seems that Germany claims not to have known that its recrudescence of submarine barbarity was loaded for the United States. They claim that we have misinterpreted an order to blow us off the ocean, where we have a right to be if we wish, because they desire to have the ocean for their own purposes. The disingenuousness of this claim is shown by a current event which is thus recorded:

"I have orders to sink every vessel coming to England," said the commander of the submarines to the crew of the American steamer "Housatonic," flying the American flag and having the American colors painted on her side.

And so the American merchant ship "Housatonic" went to the bottom, fully and deliberately identified as such. And as the United States misinterpreted Germany's message to keep off the face of the earth, she had to send us to the bottom of the ocean! If Germany did not take herself so seriously and keep running amuck in peaceful countries, one would be prompted to credit her with playing operabouffe!

WAR FORCE AND FARMING.

OTHER writers in other journals will give ample exhortation as to what resources of men and munitions must be developed in this country if war should really come. It is our province to emphasize the need for food and to

urge its production in the fullness of the country's capacity. It was Frederick the Great, perhaps, who declared that armies move upon their bellies, and the reader of Carlyle can never forget the activity of Frederick's meal-wagons, for they had quite as much dash as his flying artillery. And frightful as has been the efficiency of the new agencies and materials which the present war has developed for man-killing, it now looks more and more as though the present war would be won by the party with the full dinner-pail. Supreme effort is being made on all sides to employ a gnawing stomach against a stout heart, and it is this war measure of the Germans which impels them to barbarity and to the destruction of the lives and property of peaceful peoples who maintain their rights to sail the seas. It is therefore the duty of all those who listen to our suggestions to

prepare for maximum production of foodstuffs this season. There has been an exceptionally good season thus far for getting in crops. Seldom have so many days good for field work filled a winter, and values have encouraged an unusual effort to sow the winter-growing cereals, which are now waiting for the pushing rains to make seasonable advancement. Besides, interest in other field crops of spring and summer growth is very keen and values very promising. The production of them should reach a maximum. If war goes on they will be needed; if the war is ended during the summer, as all hope, there will be an export demand beyond measure, because all Europe has been but scantily fed for a long time and has developed a fierce appetite. All the Americans can do will not oversupply the feasting which will celebrate the return of peace.

too dry. Would you advise planting new vines in their place this year?—C. E. B., Durham.

Dying back in that way indicates some acute injury or physical condition in the root which arrests sap flow. Sometimes the vine is gophered; sometimes the condition is so obscure that it is called "over-exertion," "constitutional weakness," and other things borrowed from human analogies and not understood any better when so named. Dig out a big hole, removing all root wreckage encountered, fill the hole with fresh soil from a distance and plant new, well-rooted vines.

Canary Island Palm.

To the Editor: Is there difference between the Phoenix Carariensis and the Phoenix dactylifera palms, on the botanical basis, and are they identical in their original habitats? I argue that they are originally botanically different; but a friend argues that they are identical, and changed only in habit of growth by removal from their originating locality.—E. S. P., Stockton.

Phoenix Canariensis is a distinct and well authenticated botanical species and it has a different habitat, viz., the Canary Islands, while Phoenix dactylifera is native in Arabia and North Africa. The botanical differentiation of Canariensis from dactylifera is rather recent, having been demonstrated within a few decades, but it now seems widely recognized. Canariensis has in its habitat the same characters by which we recognize it.

Too Much Fun for Fruit.

To the Editor: I have a problem on hand here in a young bearing apricot and peach grove about 8 years old which is in a very healthy condition and makes a very heavy growth each year, but does not turn off a reasonable tonnage. What effective method can I apply to check excessive growth and make the trees put on fruit?—Grower, Banning.

Stop winter-pruning except as may be required to shorten branches which may break out by weight and wind. Stop fertilizing. Stop irrigating, except as may be necessary to be sure the trees do not suffer in late summer and fall. If the trees swing around and set plenty of fruit this spring, you can thin out and shorten shoots after setting to reduce burden of tree as may seem desirable to get good size. If this fruit does come, more irrigation will be required than if the trees dodge again this year.

Give the Trees the Better Land.

To the Editor: I have 18 acres, part of which I wish to set to figs and part to grapes. About 7 acres is about 30 inches higher than the general level surrounding it and is fairly loose soil, deep, and well drained. The other part is very flat but can be well surface-drained, but is underlaid at a depth of 2 or three feet with spots of hardpan and other spots of the stickiest clay. Which part is best adapted to the trees and which to vines? The water level, I might add, is very close during the wet season and probably never lower than 6 feet down.—E. W. D., Merced.

Put the vines on the flat. They are hardier against ill-fortune and will stand soaking for two or three months when dormant.

Fig Trees and Ground Water.

To the Editor: Is it safe to plant fig trees on a sandy loam with water within eight to ten feet of the surface? Some say the water is too near the surface to be successful. Will the roots grow that deep, and if they would, would they rot off and so destroy the trees?—H. L. S., Coalinga.

It will be safe. The roots will not be injured unless the ground water should rise considerably nearer the surface.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco, for the week ending at 5 p. m., February 6, 1917.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka	10	16.78	26.29	60	28
Red Bluff	00	11.14	14.73	72	28

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Great Whitewash Expectations.

To the Editor: I have been advised to whitewash the trunks and crotches of my fruit trees with lime and bluestone to keep the bugs down and to save spraying with lime-sulphur. Heretofore I have each spring sprayed with the latter and have had no pests or diseases. I have over 100 young black walnuts whose trunks are becoming rough and it was suggested the whitewash on them would discourage bugs planning to make their homes on them and afterward migrate to the other trees. Do you approve of the idea, and if so, what proportion of whitewash and bluestone would you recommend?—M. B., Walnut Creek.

Stop spraying with lime-sulphur until you know what you are doing it for. One can get the spraying habit just as some people take castor oil—for their peace of mind. Both habits are irrational. Of course you will learn what pests are, watch for them and use such remedies as their several natures require when you see the first presence of them. Use a good durable whitewash on your smooth-barked tree stems to protect them from sunburn. Your rough-barked black walnuts probably do not need it. Treatment of them to ward off migrating insect is a fanciful consideration because it gives fancied and not actual protection. A proper mixture of lime and bluestone is the Bordeaux mixture for which you will find formula and directions in all your California horticultural books. It is a remedy for fungi and is seldom of any account for insects.

Layering Vineyard Fillers.

To the Editor: In my Malaga vineyard quite a few are missing. I have left one or two suckers next to the missing spots with the intention of running them underground to the missing places to be filled, but some of the canes are not long enough. Do you think I can graft another cane on a short one to make it reach the missing spot? The vines are planted eight by twelve. If not, what is the best way to start vine growing?—A. C., Dinuba.

Running canes below plow-depth and turning up the ends where you need new vines is an old French prescription—the value of which we do not know. It is designed to meet the difficulty of getting a new vine to grow in an old vineyard. Such a graft as you propose would take unless you get it so far down in cold wet ground that the tissue decays before becoming active. You might reduce that chance by leaving the trench partly open for a while. You will get a new vine in the vacancy all right as a rule, but whether it comes from the old vine or simply by rooting of the cutting you can only tell by digging. If the former, it will not be long helped by the old vine. Rather than do all the work involved in such layering we would dig good holes, plant rooted vines, mulch with manure, keep moist enough to force free growth and keep fruit off for a couple of seasons.

How About Millets?

To the Editor: Is it advisable to plant millet in Siskiyou county? I never heard of any being grown here. How does it affect horses? I wish to plant it for dairy cows. Is it a good cow feed?—S. N., Hornbrook.

If we knew what plant you mean when you write "millet" we might give an opinion, for we have quite definite convictions about at least half a dozen plants which are called by that name. Sometimes the sorghums are called millets and when that is the case we have more respect for the bunch. There are several plants which look like coarse grasses and are called Italian, Japanese, German, etc. They yield a seed useful in feeding small chickens and a coarse forage which cows will live on, but it is rather poor stuff. It will also do for poor horse feed provided it is fed before the bristly heads appear. They are rather bad for horses. There is another "millet" which is one of the water grasses, making our rice-growers so much trouble. On the whole, unless your own experience shows that some particular millet is good for some particular thing, we should try to forget them. They are all summer growers and afraid of frost, and when one has summer water enough to get a free growth of them he can usually do better by using the water to grow alfalfa, fodder corn or cow peas or some other tender plant which is worth many times more than any other millet we know unless it is one of the sorghums.

Spring Treatment of Alfalfa.

To the Editor: I have alfalfa, planted last spring. The soil having become considerably packed and there being numerous weeds among the alfalfa plants, would it be desirable to either disk or harrow the field? Considering cost, which would be preferable to spread over the field, cow manure, horse manure, or a good commercial fertilizer?—J. H. M., Menlo Park.

It is a good idea to disk lightly when the surface crumbles well. This will improve the packed cover and kill much foul stuff. The relative value of cow and horse manure depends more upon the way the animals are fed than upon the kind of animal. Usually horse manure is worth more because horses are more apt to be fed grain. Cow manure is "cooler," which means that it does not ferment so fiercely, but that has little if any relation to the fertilizing contents but to the different physical condition of the excreta. A good commercial fertilizer gives you a maximum plant food for the money, but the humus content of barnyard manure and its effect on the nature of the soil may make its actual value for top-dressing alfalfa more than its fertilizer content would show on analysis. If it is convenient, try application of each on different areas which you can compare next summer and let the alfalfa plant advise you as to which menu it prefers.

Death of Garden Grape Vines.

To the Editor: I have two dozen grape vines in my yard. All have been doing good until the first of last July two of the vines began to die at the end of branches and continued to die back till one vine is entirely dead and the other nearly dead. They had made a growth of 4 or 5 feet and were loaded with large bunches of grapes. What could be the cause? The vines next to and between them are healthy. Strawberry vines four feet away from one are doing well, so it cannot be

How the Smyrna Fig and Fig Insect Came to California.

[From a paper read at the Fresno Fig Institute by George C. Roeding of Fresno.]

Early Efforts at Introduction.—In 1880, the San Francisco Bulletin Company, through the efforts of G. P. Rixford, made an importation of fig cuttings from Smyrna and Asia Minor. Later, they made a second importation, in which the late Governor Stanford actively co-operated with them. These cuttings were distributed to their subscribers, but when the trees bore and all the fruit fell off, the people who had planted them concluded that they were worthless and the Bulletin Company was censured for its enterprise in this matter. The Bulletin people themselves were finally forced to the conclusion that they had been tricked by the wily Smyrnans.

In the year 1885, E. W. Maslin, who owned a property at Loomis, Placer county, California, raised a lot of trees from seeds of the finest imported figs and planted them in orchard form. In 1889, in an address which Mr. Maslin made before the State Fruit Growers' Convention, he stated that the trees had made a wonderful growth, bore an abundance of fruit, but had all dropped off without maturing. My father, the late F. Roeding, sent the foreman of our nursery to Smyrna, at a very heavy expense, to investigate conditions there and to bring back a lot of cuttings. These were planted in nursery rows in 1887, and in 1888 the first orchard of twenty acres was planted under my supervision. The orchard was gradually extended until in 1890 there were sixty acres. These trees were pruned, cultivated and irrigated up to the year 1901 without harvesting one single crop of fruit, due to the absence of the fig wasp.

Effort to Get the Insect Goes Wrong.

—The perplexing difficulties which arose in connection with the introduction of the fig wasp might have been avoided, and the many years which intervened before the valuable insect, *Blastophaga grossorum*, was finally established, might have been brought about much sooner had the man whom we sent to Smyrna devoted closer attention to the work he had before him instead of allowing his duties to be interfered with by other matters of a more exhilarating nature.

Doubt of Desirability.—During all this period I faced ridicule, discouragements innumerable, and even my father, as interested as he was in the subject, tried to prevail on me to dig the trees up and say "good-bye" to my fig folly. It finally resulted in his deeding the Roeding Place to me, for he feared that between the nursery business (which he regarded as the most hazardous on earth) and the fig business, that I would put him in the poor house.

The general doubt of the desirability of the insect is shown by the fact that in 1889, the late B. M. Le-long, Secretary of the State Board of Horticulture, in his annual report wrote as follows about "Caprification":

"It has often been claimed that 'the fig in this State does not set, that caprification is absolutely necessary, that the seeds having no kernels fully establish this fact.' If caprification is absolutely necessary, this question arises: 'Why do figs

produce and set their fruit as well as they do in this State without it?' * * * In many parts of Italy and the south of Europe, in olden times cultivators paid much attention to setting the figs by the method of caprification. This practice was much believed in, but is condemned by most modern scientific writers as absurd. Caprification, according to the experience of practical growers, is altogether a delusion, and many of the largest plantations of the Old World have continued to bear fruit without the aid of the caprifig."

Proof that Caprification is Indispensable.—On November 10th, 1891, I read my first paper on the Smyrna fig, reviewed my experiences and outlined what I expected to accomplish. In the previous year, in the early summer months, I had demonstrated to my own satisfaction the absolute necessity for caprification, to produce the genuine Smyrna fig. I gathered pollen on the end of a wooden toothpick, forced this through the eye of a Smyrna fig, and every fig thus treated matured its fruits, while others fell off. In the year 1891, in the month of June, I carried on the same experiment again, except that I improved on the original idea by blowing the pollen gathered from the Profichi crop into the Smyrna fig, by using a glass tube drawn down to a fine point, and inserting this into the eye of a fig. The interior of the fig was not injured by this method and the result was far more satisfactory. In October, 1891, I exhibited caprificated Smyrna figs in San Francisco, and I quote from an article in the Pacific Rural Press of October 10th, 1891, written by Professor E. J. Wickson, the editor:

"We enjoyed on Tuesday a call from Geo. C. Roeding of the Fancher Creek Nursery, who brought samples of his Smyrna figs from goose-quill caprification; also White Adriatic figs to compare with them. All were cured and packed in good style. The White Adriatic figs were as well cured as any we have ever seen, and handsomer than we supposed they could be made without processing and sulphur. They were, however, very inferior in appearance and notably so in flavor to the Smyrna figs cured in the same way. The Smyrna figs had plenty of well-filled seeds, pulp of a translucent character, and with more true Smyrna na flavor than we have yet found in a California dried fig. The White Adriatic had fewer seeds, pulp of a more opaque character, and flavor far less acceptable. These samples certainly showed that there is something in the cross-fertilization of the Smyrna fig at least. Mr. Roeding operated on about 150 figs this year with the pollen of the Caprifig. These perfected fruit; those not thus pollinated did not reach perfection. Mr. Roeding will proceed with his work in this direction, will introduce the *Blastophaga* on his own account, and spare no pains to reach a demonstration of the proposition."

Continued Effort Carried to Success.—In the eight years that followed, I carried on my experiments in artificial pollination by the blow-pipe method. Meanwhile I continued my efforts to secure the *Blastophaga*, and did during this period obtain live insects at several different times, but they invariably failed to establish themselves. Finally, particularly through the action of E. W. Maslin, who never lost interest in the subject, and with the assistance of the late B. N. Rowley of the California

Fruit Grower, the importance of the subject to the fruit interests of California was ably presented to James Wilson, U. S. Secretary of Agriculture.

It was referred to Dr. L. O. Howard of the Division of Entomology. It just happened that Dr. Walter T. Swingle, Agricultural Explorer of the Division of Seed and Plant Introduction of the United States Department of Agriculture, was studying in Italy on his own account at the time. It was through his great interest in the subject and the painstaking methods that he pursued in sending Mamme figs over in the month of March in the years 1898 and 1899, that in the latter year the insect finally decided, after so many years of constant and persistent work

on my part, to become domiciled in the new world, and small as it was, to make history for the fig, as well as to place California commercially as a competitor of Asia Minor in the production of the far-famed "Genuine Smyrna Fig."

In the year 1901 I made a trip to Europe and Asia Minor to personally investigate fruit conditions, and more particularly to see for myself how caprification, cultural and packing methods are carried on in Smyrna. I spent two months in Asia Minor in carrying on my investigations. I was appointed a Commissioner of the United States Department of Agriculture, and my work was very materially facilitated thereby.

The Claim of Prior Introduction.—Strange to relate, but in the year 1908, Mr. Rixford made a wonderful discovery, and he was ably supported in the theories that he advanced by Dr. Walter T. Swingle, for in an

HIGHLY IMPROVED ORCHARD HOME FOR SALE.
77 and 22/100 acres. \$75,000. Terms.

Fronting on State Highway in most favored section of Santa Clara Valley near San Jose. Eleven-room House, Two Cottages, Garage, Barn, Tank House, Fruit House, Complete Drying Plant, Fine Pumping Plant and Stock and Tools. All ready for business. For particulars address owner,

E. V. E., Route C, Box 251, San Jose, Calif.

address made before the State Fruit Growers' Convention in 1910 at Stockton, these gentlemen were very positive in their declarations that this much-sought-after wasp, the *Blastophaga grossorum*, which had caused me so many sleepless nights, so many thousands of dollars, and such a tremendous effort, had been quietly reposing, undisturbed, in the Gates tree, about five miles southwest of Ripon. The tree was planted in 1867. From 1868 to 1908, according to the statements made in the address, this tree was colonized with the *Blastophaga*.

Shortly after this paper was read, I replied to it, fully explaining why I did not think the views expressed by the gentlemen already referred to were tangible. No reply was ever made to this article, although both Messrs. Swingle and Rixford have, from time to time, reiterated their views, claiming the insect was in the Gates tree from the time they claim it had been there, but offering nothing new to substantiate their contention. I still insist, as I did then, that the wasp became established in this Gates tree through colonies which I personally placed in the Caprifig trees in the neighborhood of Ripon and Modesto. The following is an excerpt from the article which I wrote for the "California Cultivator," of December 29th, 1910:

Another strange feature in connection with the Gates tree is that Mr. Watkins and others at Ripon, who have trees which are not much over five miles from the Gates tree, showed no signs of infestation until colonies of wasps were actually placed in these trees. How different has been my own experience! The year following the introduction of the insect on my place, it found its way into Roeding's Capri No. 3, growing on the vineyard of Mr. F. M. Roessler, five miles northwest of my place. I was not aware that the tree was growing there, and my attention was first drawn to it by samples of figs brought to my office in the month of March, 1900.

Apocalypse!—Poor *Blastophaga*, you for whom I worked and strived; is it possible that the ridicule I endured, the care of a sixty-acre fig orchard for a period of fourteen years without any returns until you came; the sending of a special agent to Arizona; the effort to secure one of your tribe from Mexico, through the recognized entomological explorer, Mr. Koebele; the plowing and harrowing I gave the U. S. Department

of Agriculture to awaken an interest in this subject; the investigations by Dr. L. O. Howard and his able assistant, Mr. A. E. Schwartz, in fully elucidating the most complicated entomological and botanical problem of the day; was all for naught? Is it possible as a poor despised worm, ant and fly you have resided in Stanislaus county these many years? Oh! that I could believe it!

[At another time we will give Mr. Roeding's practical conclusions concerning the present status of the Smyrna fig industry in California, to which the foregoing was the dramatic prelude.—Editor.]

In Conclusion.—In all fairness to myself, I consider it the duty of Messrs. Swingle and Rixford to present more conclusive evidence than they have succeeded in producing thus far, in connection with the establishment of the fig wasp in the Gates tree.

I wish to add that it is a great source of satisfaction to me to have growers claim so many superior virtues for this little wasp now, which for so many years occupied the position of an interloper in the fig industry.

SUDAN GRASS RABBIT TRAP FOR ORCHARD.

[Written for Pacific Rural Press.]

Rabbits girdle trees, and many are the efforts to prevent them. Early last spring, O. Bertinsen of Colusa county read an item in Pacific Rural Press about an almond grower who had protected a large young orchard by a few rows of Sudan grass. Mr. Bertinsen bought about five pounds of seed and drilled it in four rows nearly around his 46 acres of three-year almond trees. There were no other young trees close, and the foothills a mile away contained "lots of rabbits." The seed was planted May 9 and by mid-July most of it on one side was waist high and some shoulder high. On the other side the ground was poorly prepared and rabbits more numerous; so it was eaten down more. Every morning Mr. Bertinsen made a trip around the orchard with a dog, which killed the rabbits found in the grass. The trees were not touched because rabbits preferred the sweet grass. A gun might have been as effective as the dog.

Berry Outlook Good.

[Written for Pacific Rural Press by M. J. Moniz, Sebastopol.]

The annual meeting of the Sebastopol Berry Growers, Inc., was recently held in Sebastopol, being one of the largest attended meetings of that association which now numbers over 500 members. The annual report of the auditor showed that the organization is in fine standing financially and that in addition to handling the members' berries it is doing a large mercantile business. The 1916 season proved one of the best the growers ever had, all berries selling for a high price both in the East and for local cannery purposes.

During the season some 61,320 crates of berries were shipped to Eastern points, as far as Chicago, and 1977 tons were turned in to the canneries, making a total of 2600 tons handled, the season being a light crop one. The total volume of business done amounted to over \$315,000 and a large dividend will be paid to the growers on their stock.

President Wm. Hotle stated at the meeting that from direct information given him from large cannery representatives growers are certain of receiving a still better price for their berries the coming season, which is expected to be between \$55 and \$60 per ton. A large portion of the coming crop is already contracted.

As there is a large amount of acreage of berries being grubbed out yearly to give room to the fruit trees which are planted together, and realizing that there is a comparatively small acreage of berries being planted out, it would seem certain that a profitable future is in store for the berry industry, when taking into consideration the new markets that are being continually developed.

Ascolano (QUEEN) Olives, From Photo, Showing Actual Size.

Why not plant trees of this desirable variety of Olives,---and have a "Certainty" of handsome profits for your fruit?

The Eastern markets are "calling" for them. Their fine large size, excellent quality and attractive appearance has created an enormous demand—at "fancy" prices.

You cannot afford to wait---another year or two--"to see"--but should plant NOW---this season.

Ascolano Olive trees are quick, vigorous growers; come to bearing at an early age; produce an abundance of choicest fruit; ripening about two weeks earlier than most other varieties—thus escaping probable early frosts.

CAN SUPPLY CHOICE TREES OF THE ASCOLANO: scientifically propagated from the best-bearing "strain" in the State, —trees that have a record of producing the greatest **QUANTITY**—of the highest **QUALITY** fruit.

Write—or wire for present prices on any number and size desired.

Can also supply Mission and Manzanillo Olive Trees of highest quality, and of "certain" known origin. You should not take "chances" with any other than the **BEST TREES OBTAINABLE**, in starting your Olive orchard. "Guessing" may be dangerous and damaging. My 28 years of careful and persistent efforts have resulted in producing the best obtainable at any price.

Prices on any quantity—in any size, on application.

Free Illustrated and Descriptive Catalog, of all California Fruits, Ornamentals, Shade Trees, Roses, Etc., will be mailed you on request.

Cows Help Peaches---Both Make Cash.

Cows were bought and bedded with straw to provide humus and fertilizer for the orchard, in which alfalfa is grown for the cows and to provide humus and fertilizer.

[Written for Pacific Rural Press.]

Commercial fertilizers did all they could be expected to do in C. H. Schmidt's peach orchard in Fresno county; and still the trees did not act satisfactorily. The soil needed humus daily. Commercial fertilizers could not exert their best effect without humus; and the soil could not hold moisture. The fertilizer had usually been three or four per cent nitrogen in nitrate of soda and blood meal, 10 per cent phosphorus, and 8 per cent potash. A ton of this per acre of 100 trees had been regularly applied in winter so rains would carry it down. Probably a higher proportion of nitrogen would have shown better results; and probably a large part of the other constituents were being simply stored up in the soil for lack of nitrogen to balance them. These fertilizers were probably not carried below reach of the tree roots, for "lots of tree roots have been found here 10 feet deep."

The trees had begun to show the need of something before 1914, to give the yields that have made this eight-acre orchard of Phillips and Tuscan clings eight years old, famous around "The Home of the Peach." Now they average over 100 tons per year, which are sold under a 10-year contract at \$25 per ton to the cannery less than a half a mile away.

Two Lines of Humus making have been employed. Alfalfa and barley are sown in strips about 10 feet wide in the centers, and manure is applied on the strips remaining in the rows. Lots of manure was hauled from town, and a 20-cow dairy was put in two years ago to furnish manure on the place. Mr. Schmidt estimates that he gets about a ton a day from the cows, young stock, mules, and horses.

Handling the Manure.—None of the manure is lost. The cows stand on deep straw bedding which absorbs all the liquid manure so it can be handled. A cement floor helps save it until the straw absorbs it. This strawy manure is hauled every day to the peach orchard except when the ground is too soft or during fruit picking. When the ground is wet the manure is stored in a concrete-lined shallow pit handy for the wagon. During fruit picking, it is applied in deep furrows on another piece of land on which green feed is grown for the cows. A heavy galvanized-iron tank-wagon is used, for the same reason that the pit is concrete lined; when the strawy manure stands awhile, some of the liquid part settles free. This manure lying in the orchard, catches leaves too, and holds them from blowing away, retaining much of the soil fertility and adding humus. It is especially rich in fertilizing elements; for the cows' feed is chopped alfalfa, beet pulp, and mill feeds, most of whose fertility elements are found in the manure. Being strawy, its use on light land would be objectionable if plenty of water were not used; but Mr. Schmidt is a crank on watering, as will be discussed below. Moisture soon enables the straw to be turned into humus.

Manure is not applied direct to the alfalfa, for the straw would mix with the hay and not get into the soil to rot; manure would make the alfalfa distasteful to cows. In warm weather, too. Mr. Schmidt thinks it would burn the alfalfa if applied heavily. Its fertility reaches the alfalfa, however, as explained later.

Barley was sowed about Sept. 1, eight or ten pounds per acre, as thin as it could be flipped broadcast with three fingers. It grew a foot tall before frost, and was pastured down close by the cows to prevent its choking the alfalfa, for it stood very freely.

Alfalfa also was seeded with a sort of drill, 10 pounds per acre, but in 10- or 12-foot strips as mentioned, so it is as thick and about 20 pounds per acre in the open. This Mr. Schmidt expects to cut about May 1 when well along in bloom. Much of it will be chopped and fed green, the object of letting it mature well being to avoid scouring the cows by feeding "slushy" green alfalfa. Some alfalfa hay is fed with it. This is bought and chopped.

Much of the alfalfa grows waist high, though when the foliage gets dense, it is almost like a house under the big trees, and the alfalfa grows spindly. "I have plowed the alfalfa time and again, when it was all the mules could do," says Mr. Schmidt. It cultivates the subsoil with its roots, and absorbs or distributes the alkali which is more or less prevalent in this district.

Commercial fertilizers containing potash and phosphorus have been regularly applied until last season. It was omitted then in the belief that a surplus of these elements has been already supplied. Tree growth and crops will be watched to see if this is true.

Irrigation Distributes Fertilizer.—In common with most of his neighbors, Mr. Schmidt irrigates by flooding. The checks are made according to the lay of the land so he can turn in six inches of water all over a check; and then turn it into another check. This flood water becomes a yellowish brown on account of the fertilizer in it. This is distributed unobjectionably over the alfalfa, too.

Ditch water is used freely at 75 cents per acre per season for all that he wants. A pumping plant was installed when the orchard was planted, to provide water in the fall when the ditch supply may be minus.

Frequent Irrigation.—Most people irrigate two or three times per season, and the trees often suffer for water. Mr. Schmidt irrigates five times per season; and insists on keeping the lower strata moist. Otherwise he would expect a light crop or injured trees; for digging has shown the lower soil to be full of root feeders. Cultivation also is used freely to save moisture along the rows. But clean orchard cultivation is abhorred as the destroyer of humus.

Some places take more water than others, for while the soil is generally uniform as far down as you

would care to dig, it is mostly light ashy land washed down from the mountains and contains a mixture of feldspar, quartz, silt, etc., in varying degrees in streaks more or less noticeable.

Fall Irrigation caused Mr. Schmidt's friends and neighbors much uneasiness for his sake. They said it would kill the trees; that it was unnecessary. But he says it is very essential to peach growing on rich soil. As soon as the fruit is picked, the trees look dilapidated, the foliage is pretty much dried up, and the trees are nearly dormant. Their fruit buds have started, but are not developed into good vigor ready for a reasonably sure setting of fruit next spring. An irrigation now starts new vigorous growth on the trees in a few days. If fertility is there and kept available by enough water, the fruit buds become fat and strong, and the terminal buds mature well. Without water, even a vigorous tree would stay dormant and not have circulation enough to develop the fruit buds satisfactorily.

If trees are not vigorous, and fertility is not supplied, this fall irrigation and the growth it starts would exhaust the tree more or less; and if oft repeated may kill the tree. Many trees die anyway, for lack of water during fruiting and in the fall.

Pruning was done to get early bearing; and this did not hurt the trees, for they were well nourished. The land had been manured heavily. Otherwise, his system of cutting off only the terminal buds of the young trees and thinning out what was necessary, would have resulted in spindling trees. The 70-ton crop claimed for the 8 acres of three-year trees, indicates his success in that direction, while the tall, stocky, abundant main limbs covered with heavy new growth and foliage require heavy pruning now. They are well spread and the centers kept clear of all but short growth; for daylight, inside and out, is necessary for permanent results. Fruit is encouraged to the limit on the lower parts of limbs; and none of them are sunburned.

The Dairy.—High grade Guernseys and Jerseys are bred to a purebred Guernsey bull. It is intended

to work into purebred Guernseys. They are kept in the barn during bad weather and fed liberally on the balanced ration mentioned. An expensive sterilizer has just been secured to insure clean cans. A steam boiler packed in asbestos, and burning distillate, supplies the heat for washing and sterilizing utensils. Pure raw milk is bottled in a light, screened and cement-floored dairy house. It is sold to a private trade which has been worked up in the nearby town.

Mutually Helpful.—So the cows furnish milk for part of the cash income, and manure for the orchard and alfalfa. The orchard also furnishes cash income, and feed for the cows. About \$15,000 worth of fruit have already been sold from the trees, and the milk money from 20 cows would seem enough for one man. Thus is illustrated Mr. Schmidt's purpose to show what can be done by intensive farming of a small piece of land.

CALIFORNIA PRECOOLING PLANTS.

One of the most interesting papers read at the Illinois State horticultural convention was that by Prof. John W. Lloyd of the University of Illinois, in which he explained California's method of precooling fruit. An outline may be interesting to readers who are not directly engaged in fruit handling:

A number of precooling plants have been established in California, and every year many carloads of fruit are precooled preparatory to shipment. There are two types, car-precooling and warehouse precooling. In the former the freshly packed fruit is loaded into an uniced refrigerator car and hauled to a central precooling plant where cold air is forced through the cars for from three to five hours. Under this method the temperature of the air forced into the car is sometimes as low as 20 degrees, but it does not freeze any of the fruit unless treatment is continued too long. As soon as this process is completed, the car is iced in the usual way and shipped.

In warehouse-precooling, the packed fruit is stored up in tiers in a thoroughly insulated room and there subjected to cooling by means of cold air forced from a conduit through numerous small holes in the floor. In the case of oranges, the desired temperature is about 35 degrees and requires 36 to 60 hours' treatment, depending largely upon the temperature of the fruit when put in. After the fruit is cooled it is loaded into a car that has been previously iced, the car is closed tightly and in the spring shipments, is not re-iced in transit. Eleven days are required for cars to reach New York, and in the month of May usually arrive with bunkers one-third full of ice and fruit in fine condition. These precooling plants, which depend upon ammonia coils and refrigeration machinery for reducing the temperature, require a large outlay of capital, and workers in the Department of Agriculture have devised equipment for a small precooling plant in which the air is cooled by forcing it through a mixture of crushed ice and salt. Such a plant is used by the Sebastopol, California, berry growers' association.

Buy Your Orange Trees NOW

From the famous SAN DIMAS NURSERIES—
"THE CRADLE OF THE CITRUS TREE."

More successful Orange and Lemon groves have been grown from trees selected from our nurseries than from all other parts of the State combined. BEAN POWER SPRAYERS

THE LAST WORD.

Wherever fruit is grown Bean Sprayers are known for their day in and day out efficiency—for their downright dependability—ease and economy of operation—low cost of maintenance—strength—durability—and all around satisfaction.

Thirty years' experience in the building of Spray Pumps has firmly established Bean Spraying Outfits as the world's standard. The Bean is in a class by itself. Hundreds of testimonial letters from satisfied and enthusiastic users attest this fact.

This preference for Bean Outfits is not a mere chance. It is because growers the world over know that Bean Sprayers deliver and get results—that they are the last word in power sprayers.

BEAN EXCLUSIVE FEATURES.

BEAN PATENTED AUTOMATIC PRESSURE REGULATOR—which ends all safety-valve troubles. Absolutely safe and certain. When nozzles are shut off, the liquid is simply pumped back into the tank, without being put under pressure. Saves fuel and much wear and tear on engine and pump.

BEAN PATENTED THREADLESS BALL VALVES WITH REVERSIBLE SEATS—simply ball metal balls which cannot stick, corrode, or give trouble. Reached in two minutes without stopping engine and withdrawing liquid.

PORCELAIN-LINED CYLINDERS—Cannot be injured by any liquid. **NO STUFFING BOX**—hence the source of much sprayer trouble is entirely eliminated.

UNDERNEATH SUCTION—which greatly increases capacity; never requires priming; and makes it possible to empty tank in a few seconds. **BEAN REFILLER**—Fills 200-gallon tank in five minutes.

ECCENTRIC'S INSTEAD OF CRANKS—More durable than cranks, and wear can be easily taken up.

BEAN ROCKING BOLSTER—Wheel on either axle can be in rut without tipping tank or springing frame.

DIRECT CONNECTED ENGINE AND PUMP—Saves power. Pump and engine are bolted direct to steel frame, giving perfect rigidity. Frame is bolted direct to axle, saving 6 inches in height and 150 pounds in weight.

INTERCHANGEABLE PARTS—All parts can be quickly and economically substituted for those that become worn.

NOVO ENGINE—The simplest, sturdiest, most efficient little engine on the market, and unsurpassed for sprayer use.

BEAN SPRAYERS MADE IN ALL SIZES.

We make a complete list of Power Sprayers at from \$100.00 up—as well as Hand and Barrel Pumps, Nozzles, Hose, and all Pump Accessories. Our catalog describes the entire line and explains fully the new 1917 outfits. Send the coupon.

MISSION OLIVES

EARLY RIPENERS

THE EHLMANN OLIVE CO.

Oroville, Cal., Nov. 17, 1916.

Mr. W. A. Hayne, Box 461, Marysville, Cal.

Dear Mr. Hayne: Answering your kind favor of the 15th, I am enclosing herewith photograph of some of this year's fruit on the Fogg grove, and you will note that they are above the average Mission. We also were able to harvest this entire crop before the frost, which shows that they are early ripeners.

We will be glad to keep in touch with you on this matter, and if we can be of any further service, don't hesitate to let us know.

Yours very truly,

I propagated the Fogg orchard thirty years ago. The origin of the Fogg trees was directly from the old Mission at Santa Barbara. The trees I have now for sale are full brothers to the Fogg olive trees, and like the Fogg trees, they are all propagated from the large size cuttings. W. A. HAYNE.

ARTHUR CANN, Seedsman,
SAN JOSE, CAL.

Alfalfa Helps Apricot Yield.

[Written for Pacific Rural Press.]

A thousand dollars for the crop from about 300 ten-year Newcastle apricot trees in Imperial county is last season's record for E. H. Erickson. Three reasons for this are emphasized.

Alfalfa among Trees.—The trees bore a big crop their fifth year. From the sixth year, the crops diminished in spite of heavy manuring. The ground under most trees was covered thick with tons of rotted horse and cow manure, but some trees were left without it. No difference was noticed.

A row of old trees along the edge of an alfalfa field, however, had always borne heavy crops regularly. So two years ago, alfalfa was planted in the orchard. It made a good stand, was cut, and pastured. Last spring it was plowed up about six inches deep. Shallower plowing is impracticable in alfalfa because "you can't hold the plow less than six inches deep." It came up again, flourished all last season in a fair stand, was cut four or five times in little batches; and within the rows it went to seed so that late in January, 1917, a multitude of new plants were coming up. It is furnishing pasture for the family cow. For the sake of cultivating the trees, it will be plowed again this spring, and expected to flourish again. "The alfalfa seems to be just what the trees need," says Mr. Erickson. It furnishes nitrogen, for much of the tops are turned under and the cut-off roots decay, the lower soil is permeated with humus; and perhaps the shading of the ground has something to do with it.

Results Encouraging.—The new wood growth the past season has averaged six feet long, fat, plump, with as many as four sets of fruit-laterals and lots of fruit buds on the main stems of the new growth. These fruit buds are as fat as can be found outside the Valley. They are in striking contrast with almost every other orchard in the Valley, for most of the rest have peaked little fruit buds on slender thin short little weazened-up twigs, scarce and discouraged. Mr. Erickson's trees are ready for as good or a better crop than last year.

Irrigation is given much of the credit for the crop and wood growth. High borders surround the checks, and the water was run into them nearly two feet deep around the trunks of trees all day long once last fall; for Imperial Valley normal rainfall is only two or three inches per year. Next morning the water was all gone. The soil is light and the subsoil lighter. Mr. Erickson has dug five feet deep and was then able to push his shovel handle deep into the subsoil. With a retentive subsoil, he points out, this might easily be too much water.

Throughout the growing season, he gives the trees water whenever they need it, which is likely to be every two weeks. Only when in blossom must irrigation be withheld. The orchard was to be plowed early in February and worked down, and then after blossoming, given a good soaking.

"It is my experience here on this

soft porous soil," says Mr. Erickson, "that the more water I give the apricots after they are well set, the earlier they ripen. Last year was an extra early season; and my first shipments of apricots went out late in April."

Pruning.—The third reason for Mr. Erickson's good crop of 1200 or 1400 crates last season is his system of pruning. This was done late in January, 1917.

The limbs had been cut back rather short from early life, so that the years can be easily counted by the crooks in them. They have, however, been kept thin enough so that laterals now growing out of the wood of all the years except the first have thrifty new growth with plenty of fat fruit buds. Practically all of them are well matured to the tip, not being shriveled at the ends for lack of nourishment.

An important trouble with the training of young trees in Imperial Valley, says Mr. Erickson, is that in their first years they were cut too long and have not adequately shaded themselves. Their bark got hard and black-and-blue. Fruit wood grows only in the top; and the fruit there is small and inferior.

Though he was cutting back the new wood-growth severely, not even leaving fruit buds or laterals on it in most cases, all laterals from last year's and older wood were left entire, except where thinning was necessary.

The extraordinary fruit-wood growth down all over the main limbs not only shades the bark from sunburn; but it bears fruit as juicy and fine and considerably larger than that in the tops of the trees where more sunshine gives it redder cheeks.

The general plan was to keep the center open, and to leave only one shoot of new growth at the end of the two-year wood where several usually grew this past season. Since the trees are pretty big (some even touching across the 24-foot space between them) only the vertical shoots were saved; and this year these were cut back to about eight inches, below the first burst of laterals. Shoots leaning outward were cut off, even though plumper and stronger than the vertical ones left.

DATE PLANTING.

No date offshoots from abroad are available for planting and there are practically none from California date gardens. Seedlings, however, are quite numerous. Planting such has already produced more good varieties in 10 years than were produced in the old country in 300 years, according to Bruce Drummond whose work in charge of the Mecca and Indio Government date experimental stations has contributed most of what Californians know about date growing.

It is reliably estimated that 5 per cent of the total orange crop of the Redlands district was frosted but much of the district escaped injury. Frost fighting preparedness would have been a good investment for those who, as it proved, were in frosty locations.

NOW is the Time to Fertilize Fruit Trees

The rains will dissolve the plant food and take it down to the roots. The well-fed trees will bear and mature **BIGGER CROPS OF BETTER FRUIT.**

Fertilizing is not an expense, but an investment, yielding large and immediate returns.

PLOWS ORANGE COVER CROP IN JULY.

[Written for Pacific Rural Press.]

Much of the orange soil on the ridge southeast of Redlands is heavy and likely to harden when it gets dry. It seems to be decomposed granite without enough humus for good orange growing. Melilotus winter cover crops are generally grown, with clean cultivation through summer. It seemed to W. N. Barlow, who has charge of the work on H. H. Ford's ranch, that clean cultivation and sunshine through the summer was burning out much of the humus put into the soil by winter cover crops. Moreover, by plowing them under early in spring, he was not getting the full amount of humus. So last year he selected the worst two acres on the top of the ridge and allowed the melilotus in alternate centers to grow until all the green color was gone and all possible raw material for humus was made. This was plowed under after the July irrigation, and Mr. Barlow says the trees very soon showed a marked advantage in leaf color and growth over those in rows next to the two acres. He also notices considerable improvement in softness of the ground. This piece, which was the worst on the ranch to wilt in the summer, now takes water so that it will be safe to leave melilotus on the whole area to mature next season. He says that if he had left all of it last season, the water would have run through and off from its hard crust with the trees wilting for water even at the time. Working this land in connection with irrigation does not keep it in good shape; for where it takes 50 inches of water to cover an area in summer, by late fall it is so cemented that 10 or 15 inches will cover it and of course the roots get very little benefit. In spring, after winter rains have soaked it, on this particular piece, water soaks away too deep, for there is not enough humus to hold it where roots can use the water. Of course where not enough water is available, as seems to be the case here, it should all be permitted to penetrate to tree roots and not beyond them. This, the extra humus is expected to make possible. That the trees on the two acres are not this February in much better shape than their neighbors, is ascribed to water shortage all around. But that they are in equally good shape shows greater improvement than their neighbors.

CULTIVATE AFTER RAIN.

Two neighbors in Fresno county plowed their vineyards at the same time just before the last rain last spring. One of them didn't touch his vineyard, waiting for another rain, till about five weeks later. Then he ran the water through, and "had an awful time replowing."

The other man, Mr. Pickup, ran a revolving harrow over his vineyard as soon as possible after plowing; and three weeks later when he replowed, most of the vineyard turned up moist dirt. He cultivated eight or ten times before ripening and got a good crop of Muscats.

"This heavy land," says he, "must be worked after every rain or it will bake hard and then will not take water unless the water is backed up and held to soak."

Turlock Cantaloupe Planting and Culture.

Unusual system of planting reduces damage to vines at picking time and saves labor. Careful culture gives over 4,000 crates from less than ten acres.

A heavy yield of fine cantaloupes right up to frost is the unusual feature of Geo. D. Mead's farming in Stanislaus county. It is due partly to his system of planting and partly to his way of picking. From 9 or 10 acres he sold over 4,000 crates last year through the Turlock Merchants' & Growers' Ass'n.

Mr. Mead and his family learned a lot about cantaloupe growing in their first year. They lost half of that crop due to various causes.

Early in January, 1917, they were plowing ten acres for the 1917 crop. This winter plowing was eleven or twelve inches deep to get a soil reservoir for winter rains and to turn under the manure, which is applied thinly all over rather than heavily on a part each season. Straw manure is likely to "burn out the ground" in this sandy soil and should be worked in well and deep. The next plowing is only six or seven inches deep. This is done early in March just before planting time, which would best be about Mar. 15 if the soil is warm and the rains over. Last year the Meads planted just before the last hard rain. The crust which formed needed loosening even at expense of plants. A couple of little spike harrows hitched to a pole fixed two rows at once.

Rows Uniquely Laid Out.—In their first year, the Meads laid out their rows in the customary way, omitting every ninth one for a driveway for convenience in picking season. Then the pickers, two or three of whom were hired, but most of whom were in the family, had to pick as far as the sacks they carried would hold the melons, then climb over several rows to unload into crates in the drive. This damaged the vines and reduced the later settings of melons. It also wasted the pickers' time.

To avoid this loss, last year no rows were omitted for drives, but the drives were laid out with a harrow, crosswise of the rows. They were put just far enough apart, about 10 rods, so that a picker commencing at one drive would pick a row and arrive at the next drive with his sack full. It would be dumped there, and he would proceed on across the field.

In their first year the Meads had inferior varieties which ripened all at once and got soft, so nearly half rotted before they could be marketed.

"Pollocks 25 Rust Resistant" seed from Rockyford was supplied last year by the T. M. & G. at cost to its members. This was \$1.25 per pound; and two pounds were supplied per acre, though Mr. Mead thinks a pound is enough, barring unfavorable weather or loss of seed by pests. Only this variety is desired by T. M. & G. because they need uniform melons on which to build and keep their reputation. Their men had inspected the Colorado fields and selected those bought for seed last season.

Sprouted Seed.—Much or perhaps all of the seed was sprouted before planting, but Mr. Mead points out that this practice is fraught with danger. If seeds are kept too warm, they are forced too quickly; and if the tender sprouts get longer than just a nib on the seed, they are likely to break off and the seed dies. If at the right stage of sprouting, the weather and ground are cold or the weather rainy, obvious results follow.

The seed are put in a sack, soaked about 12 hours, flattened out not over an inch thick so they won't overheat, and buried in sand. They sprout in two or three days, depending on the heat, and must be planted at once. The field is harrowed two or three times while the seed are sprouting.

Planting.—Seed were planted on the level in rows about six feet apart by machine last year, but by hand the year before. The machine uses more seed, but is so much faster that neighbors borrow the Mead planter when they are not using it. Some folks use a sweet potato planter. Any machine requires one person to drive and one to work out the seed. The Mead machine will be described elsewhere. It drops the seed thickly in rows, not in hills. The straighter the rows, the easier they are to cultivate and the easier it is to cut out volunteer plants from the undesirable varieties previously grown.

If plants are very thick, they are thinned with a hoe as soon as they come up; but later if not so thick. The final thinning comes about June 1 when the vines average a foot long, showing which are strongest. These are left as nearly as convenient three feet apart.

Irrigation and Cultivation.—If continued cultivation does not keep the vines growing, they probably need water. This was given once last season through a furrow in each center. Plenty of time was allowed for a thorough soaking, but no water was allowed to touch the plants, because that would bake the soil around them. Several rows were irrigated at once with a small stream. Within two or three days the ground was cultivated and the vines soon showed better growth. The first year the irrigator would fill a ditch or two and then run the whole head into the next one or two, but that system did not supply enough water and consequent vine growth. About two more cultivations were given before vines prevented.

Nurserymen report sales very heavy and some lines cleaned up. One large company states that they have sold their entire stock of pears, apricots, prunes, nectarines and almonds. Apples have been above the

average in demand, cherries have been slow in moving, peaches also slow, but there is some demand for clings and early sorts. Good call for table and raisin grapes. Ornaments of all kinds are selling well.

Paint Without Oil

Remarkable Discovery That Cuts
Down the Cost of Paint Seventy-
Five Per Cent.

A Free Trial Package is Mailed to
Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powderpaint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof, sanitary and durable for outside or inside painting. It is the cement principle applied to paint. It adheres to any surface, wood, stone, or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, Manufacturers, 146 North Street, Adams, N. Y., and he will send you a free trial package; also color card and full information showing you how you can save a good many dollars. Write today.

That Dose of Gypsum.

To the Editor: In your issue of January 13th you suggest a dressing of gypsum to alfalfa at the rate of 1000 lbs. to the acre. Is not this a printer's error and should it not read 100 lbs.? I ask this as it is a most important matter and I have never heard of such quantities being recommended except to overcome the poison of black alkali or by salesmen. Though I cannot recall the many interesting experiments I saw at Rothamstead 30 years ago, it has been firmly implanted in my mind and substantiated by practice that nitrate of soda and gypsum are both in the nature of stimulants. They leave nothing desirable in the soil but take away from it.

Nitrate of soda, of course, gives immediate nutriment to the plant and robs the soil for the next crop unless other permanent ingredients be applied afterwards. Gypsum robs the soil if applied in large quantities and gives nothing. I think, from one to four hundredweight of gypsum applied during a dry spell on any of the legumes or alfalfa would be beneficial. More than that will result in dilapidation no matter how vigorous the stand or how rich the ground. We are all trying and trying to better the conditions of our soil—the most valuable in the world—to give it more humus and nitrogen, to make it more friable with judicious applications of lime and careful working. Our experiment stations are doing splendid work, but they need years behind them yet. Because splendid immediate results are obtained by the use of gypsum our farmers should be warned to use it with caution and not abuse it. Gypsum does best on light, sandy or gravelly loam and not so well on heavy soils unless they have been well limed beforehand.

We have not yet learned how to conserve our stable manure satisfactorily in this dry climate and we are all trying our best to reduce loss from exposure and firefang. Here is where gypsum is most help and where its use can be fearlessly advocated, i. e., as an absorbent and fixative for the ammonia. It is very useful to keep also as a dust for the

chicken houses. Here again it is said to fix ammonia in the hen manure where the use of lime would release it.

J. J. F.

Napa.

[The prescription was based upon the (at least tentative) demonstration by Reimers of the Oregon station that sulphur is often a good plant food for alfalfa and sulphur can be had from raw sulphur or from gypsum or from superphosphate. While it is of course true that gypsum does act upon potash and set it free to be used by a plant or washed away by drainage, it can be hardly held to rob the soil, because potash has a way of its own of resisting washing out. As for leaving anything in the soil, gypsum leaves lime, which may or may not be of much value. In some cases the plant may need it directly as a plant food or indirectly as a promoter of bacterial action in the soil. On the whole, gypsum now appears to have more value and less injury than was held at the earlier time to which you allude. Still your point is perhaps well taken that 400 lbs. per acre would be a wiser amount than 1000 lbs. You are right about the superior desirability of plaster on lighter soils, because gypsum is apt to increase acidity in heavy soil for which lime and not lime sulphate is the corrective.—Eds.]

About 5,000 carloads of cantaloupes were shipped from some 8500 acres in Imperial Valley last year according to Horticultural Commissioner F. W. Waite; and the nearly 12,000 acres signed up this year are expected to yield about 8,000 cars. If plans go through, the total shipped out will be considerably less than the yield; for it is hoped to prevent shipment of inferior melons this year by county ordinance if the State Legislature fails to act satisfactorily.

Agricultural Bills Introduced.

Interest centers in various bills affecting the office of State Markets Commission. One bill calls for the repeal of the commission because of a doubt as to its continued existence, while two other bills would enlarge the powers of the Market Director.

A bill introduced into the assembly specifies the manner in which fruits and berries of many kinds may be packed.

A bill relating to land ownership and settlement will provide a way by which those entering on colony lands may have a lien of some equity in the land.

In his eighth biennial report Dr. Chas. Keane states that to accomplish the work which the law calls for his office will need \$70,000 instead of \$10,000.

It is reported that reclamation and flood control will be big issues at Sacramento this session.

A bill has been introduced which would prohibit the sale of eggs in bad condition and their use in manufactured products.

A bill providing that no foodstuffs of a perishable nature be kept in storage for more than 90 days.

Drainage districts organized under an act of 1903 would be validated by passage of a drainage bill introduced.

A seed commissioner with a salary of \$2400 per year whose duties would be to establish the purity of agricultural seeds is provided in one bill.

On request of 15 per cent of the qualified voters of a district a county free market would be established, according to another bill.

An appropriation bill for \$800 was introduced to defray expenses in making an official search for an insect to destroy beet leafhopper.

A bill introduced enlarges duties of county horticultural commissioners to compel eradication of plant diseases or animal pests and allows filing a lien on property to cover expense.

Companion bills proposing the establishment of a land settlement board of five members to promote better agricultural settlement and to enable the State to acquire 10,000 acres for colonization purposes were introduced.

A bill asking for an appropriation of \$150,000 for the establishment of a University Farm in Southern California.

The Imperial Valley Agricultural Assembly this year is to be held Feb. 10 at the annual meeting of the County Farm Bureau. Dr. Elwood Mead and Director Forbes of the Arizona Experiment Station are among the programmed speakers.

Hercules Triple Power Stump Puller

Get My New FREE Land Clearing Book Fortunes In Stumps

Here is the only real Triple Power, Portable Stump Puller ever built. Read how it is making money for owners.

A tremendous American story—how two workmen in a little western town built a vast business by making fortunes for others. Thousands of men are making big money now—every day—every month—with the Hercules. Find out how. Write for the story. It's human. It's real. It's true. Write today.

HERCULES Triple Power Portable STUMP PULLER

Torrens Title System and Farm Loans.

[Written for Pacific Rural Press.]

The farmers in this part of San Joaquin county are becoming much interested in the "Torrens Title System." In fact plans are being formulated whereby an organization will soon be effected, and immediate steps taken to pool their interests that will materially redound to the financial benefits of all the property owners who take advantage of this movement.

For the benefit of those who may not have become sufficiently interested in the law to familiarize themselves with it, it might be of interest to make a brief explanation of its purpose and how it works.

The Old Way with Titles.—We have in this country two different methods of dealing with land or property titles. The first system, and the one most generally used, is the recording system, of which most property owners are already quite familiar. The second one is that of the Torrens System. While this is not a new system, yet, it is not generally in use, although many of the Eastern States are using it quite extensively. In this State it is being put into practice quite generally in the Southern part, and leading judges and attorneys pronounce it a decided success. Just why it has not been put into practice in Northern California more than it has is probably better known to the present abstract companies who have all these years reaped a fat harvest from the property owners.

The Torrens Way.—The Torrens System is a system under which all instruments affecting title and real property are filed with the registrar and proper notation made by him on certificates of title kept by him. In brief, the Torrens system is a method that does away with the expensive and long searches of title by providing what is practically a land index in the office of the registrar of title. All land brought under the Torrens system is immediately indexed, not only according to description of the property, but also according to the name of the owner. For every parcel of land there is an original certificate of title in the registrar's office; that certificate of title shows the condition of the title to that property and is always up to date. By examining the certificate, which is a decree of the State of California, vesting the title in a certain individual, one can ascertain in a few minutes the exact condition of the title to the property and can learn whether or not there are any mortgages, liens or incumbrances of any kind against it, the names of the holders of those of adverse interest, and their addresses, and also the amounts of such liens or mortgages. When property is transferred, the seller, or the buyer in his behalf, merely files in the registrar's office his dupli-certificate and his deed to the purchaser, and the registrar cancels the old certificate and issues a new one to the purchaser. This requires but a short time and costs the purchaser only \$1.00. When property is mortgaged the owner presents the duplicate certificate and the mortgage at the office of the registrar, who receives and files the mortgage and makes a proper note thereof on

both the original and duplicate certificate; this costs only fifty cents and requires but a few minutes of time. The certificate, as to all people who act upon it in good faith, is conclusive evidence of the title to the property, and behind it is the guaranteed fund provided by the Torrens law to protect any person who might suffer injury by reason of any mistake that might be made in the certificate. With every transfer of land a new certificate is made out, with the result that the title is always up to date, and one wishing to know about it does not need to go back to the original source of the title, or make anything in the way of a long search.

How Title is Determined.—The method by which property is brought under the Torrens system is as follows: Property is registered under the Torrens law by filing a petition in the Superior Court of the county in which the land is situated, requesting said court to determine the title to that land and order the same registered. In this State, any number of owners, and any number of parcel is less than it is in those united in a petition. The result of this provision in our law is that the cost of registering any particular parcel is less than it is in those States where each owner must bring a separate petition. After the petition is filed the court refers it to an examiner of titles, who searches the records and reports back to the court as to the condition of the title to the property. The court then orders notices to be given, which is done by publication in some newspaper of the county, and also by personal service on the owners of the adjoining lands and on any who hold interest in the land that is being registered. After notice has been given, a day of hearing is set at which time the owners testify as to the way in which they acquired title to the property and whether or not there are any liens or mortgages against it.

After hearing, the court signs the decree that establishes the title to the property and the registrar makes out the certificate according to the facts set forth in the decree.

The Difference in Cost.—One of the advantages of the Torrens system over the old recording system which is chiefly used in this State, is the difference in the value of the certificates. The certificate of title one gets from the ordinary title companies merely guarantees that the records were correctly searched and that guarantee is only good for two years, which means that, if because of any fact that arises outside the records, as is often the case, the title is no good, or if some mistake, even in the search of records, if after two years from the date of the certificate, the injured party has no recourse whatsoever against the title company. It is not at all uncommon for persons to lose their property by reason of facts outside the records that are never covered by the title company's guarantee.

Guaranteed by the State.—The certificates obtained under the Torrens system is not merely a statement to the effect that a search of the records shows the title to be so

and so, but is a statement from the State of California, vesting the title in a certain individual and behind that statement is the guarantee of the State to protect any person who might in any way be injured by reason of any mistake or error.

In other words, in case the property owner loses his property through an error of the title companies he has no recourse whatever, while under the Torrens title, the State pays him the amount of the loss he has sustained by reason of an error made in the title.

Again, there is a material difference in expense and convenience of the two systems. The initial expense, by reason of the fact that companies have been organized for the purpose of registering property under the Torrens law and are able to combine in one petition anywhere from one to one hundred or more parcels, the

initial expense of getting one's property under the Torrens system is in few cases greater than the cost of getting an ordinary certificate of title.

The registering of property under the Torrens system wipes out all the old clouds on the title that do not really affect it, and yet are inconvenient every time a new certificate is required. In other words, the title is given a new birth when brought under the Torrens system.

When property is registered the question of whether or not it is community property is determined at the time, thereby preventing perjury and fraud frequently committed under our present system, especially in probate matters.

When property is registered under the Torrens act, all people who have any interest in it are from then notified whenever any street liens, or

Leading attorneys in the United States who have made a thorough study of the Torrens law have unanimously recommended it as a great improvement over the old system and have decreed it to be constitutional. In every State where the Torrens system has been questioned before the Superior Court of the State, its constitutionality has been decreed. Justice Holmes of the Supreme Court of the United States; Ex-Justice Hughes, and the Hon. Chas. C. Tarry, President of the American Bar Association, all have decreed the Torrens system constitutional.

Relation to Farm Loan Business.
—Thus we find ourselves, upon investigation, in possession of a law enacted for the purpose of benefiting

us, but of which we have not yet taken advantage.

Apparently, in this part of the State at least, the property owners are awakening to their privilege. With the advent of the Federal Farm Loan Bank, and the birth of the different Farm Loan Associations throughout the State the old and expensive system of title searching is doomed to be relegated to the rear. Let the property owners take hold of this, their privilege, at once, get in touch with the different secretaries of the National Farm Loan Associations of their immediate districts, and arrange to get under the Torrens system of obtaining title to their property.

J. B. Jorz,
Secretary of North San Joaquin
National Farm Loan Ass'n.
Acampo.

Early Sweet Corn.

Sweet corn planting is on, Feb. 1 to 15, in Coachella Valley. R. R. Cheatham is one who makes a neat sum from the Early Adams variety by shipping to the Los Angeles market. From four acres last year he averaged 30 cents a dozen for the whole crop of over 3000 dozen ears.

He drills 10 pounds of seed per acre in rows three feet apart on ground previously flooded and worked down fine. It is a light silty sand more or less mixed with heavy silt from last spring's floods and those of previous years. The ground is already well warmed up, though the winter has been unusually cold. As soon as the corn is well up, it is hoed and thinned to about 15 inches apart in the row; is watered and cultivated about every 10 days until the tassels come, usually about two months after planting. It is forced along so fast by the water and hot weather that worms are too slow to damage it much.

Some of this sweet corn has been picked ten weeks after planting, though this is not usual. In about 10 days after the first picking, the third and last picking has been made, the corn packed in boxes of three dozen each, and shipped.

The stalks are cut right after the last picking and while still green in June. They cure overnight and are

hauled and stacked within 24 hours after being cut. In this Valley the dryness and heat make possible such prompt stacking, and the stalks never spoil. They come out of the stack bright and green; and are eaten up clean by the cow and horses.

Beans Follow Corn.—To fertilize the land and shade it from sun as well as to get another crop, 20 pounds of pink beans were planted per acre on the corn land after the fodder was taken off. About Nov. 1, a crop of 1,000 pounds per acre was cut. If 40 pounds of seed had been planted, Mr. Cheatham says the crop would have been increased 500 pounds per acre; for with the thin planting, the beans made too much vine growth. The vines were offered to stock, but only the pods were eaten. The fine stuff from the vines was put back on the ground to supplement the fertility added by flood silt last spring.

Weather Bureau officials have started a campaign for more accurate terminology for various kinds of frozen rain. Sleet is officially described as small globules of rain frozen before striking the earth. When rain freezes after falling and forms a glassy coating on the ground, trees and wires, the condition is called a glaze, and when this is severe and accompanied by wind, it is reported as an ice storm.

What About California?

Dr. B. M. Rastall, head of the industrial survey conducted by the San Francisco Chamber of Commerce, has devoted a great deal of time to analyzing the resources of San Francisco and the State in natural resources aside from those supporting agriculture. Among other statements made by him are these:

"California is very rich in the most important lines of raw materials. The Pacific Coast has five-elevenths of the standing timber of the United States and 20 per cent of California's area is in forests. At the present rate of cut, California has a visible supply of 140 years of redwood and 350 years in mixed timber.

"In the minerals, California is the fifth State in value of output but in the opinion of leading geologists is first in the variety and value of its mineral deposits. The State has deposits of practically every mineral known in America. In gold production California is first in this country.

"The Pacific States have 40 per cent of the developable water power of America. Only 8 per cent of California's water power is at present being utilized.

"The situation is even more extreme with regard to oil. Two-thirds of the world's supply of petroleum is produced in the United States and nearly two-fifths of the American supply is furnished by California, or approximately one-quarter of the total world supply. This oil is brought to San Francisco bay by pipe lines of so low operation cost that for all practical purposes San Francisco is placed directly alongside the wells."

FIELD CROPS.

Asparagus shipping from Imperial Valley will begin early next week, according to advices of a Rural Press representative.

Prospects are good for a big barley oat crop in the Ramona district of San Diego county. Planting is being done at this time.

Reports from Imperial Valley say that there will be about 11,000 acres of cantaloupes planted in that section this year. Shipments will begin about June 1.

Two thousand 50-pound crates of Bermuda and Crystal Wax onions were harvested from two acres in 1915 by E. A. Miller of Coachella Valley.

The Timken Ranch Co. announce that they will plant 1400 acres in cotton at their Imperial county ranch this year and 1400 acres to alfalfa.

According to George Hewlett, President of the Cal. Hop Growers' Ass'n, a 20 per cent reduction in the hop acreage of the State would materially benefit the hop markets.

As a result of a satisfactory try-out of the Globe rice mills at Woodland recently that mill is now in daily operation milling some 150,000 sacks of rice which the concern has in warehouse.

One picking of peppers yielded 1800 pounds from an acre for Fred Miller of Imperial county last year. It was planted Feb. 20. The peppers are only good from early May till early June.

Nine cuttings per season, averaging 1½ tons per acre are claimed for Peruvian alfalfa on 45 acres worked by A. H. Smith of Coachella Valley before it was covered by the floods of 1916.

It is said that Edward Swanson, in the Pixley district of Tulare county, will plant 2000 acres to rice this season. This will be the largest acreage of rice under one management in the State.

A Rural Press representative writes that about 2,000 acres of land in the Brentwood district of Contra Costa county will be planted to sugar beets this year, most of the land for which is being subsoiled.

A report from Turlock says that 4,000 acres of land along the Tidewater and Southern railroad in Stanislaus county will be planted to sugar beets the coming season. Much of this land has not been farmed in recent years.

Potato buyers have been quite numerous in the Gold Ridge district of Sonoma county recently paying growers \$2.20 per cwt. in carload lots. Only two or three carloads of last season's crop remains in growers hands and seed is selling at a high figure.

Asparagus shipments will be made from Walnut Grove and other Sacramento river points about March 1. It is expected that 325 cars will be shipped from those sections this season. It is estimated that there will be 1,000 acres more asparagus planted in the district this spring.

The coming season promises to be a prosperous one among ranchers of Southern California. The price of all produce is so high as to make crop growing profitable. The rainfall so far has been rather light, but the mountains are full of snow, which means plenty of water for irrigation.

The aphid pest in San Luis Obispo county is to be combated by the bean growers, the County Horticultural Commissioner having started the State and Federal machinery at work on the pest. The damage done to the bean growers last year is estimated at \$200,000. It is said that the horse bean acts as an alternating host and so helps the pest through the winter.

CITRUS AND SEMI-TROPICAL.

Orange shipments increased in size from Riverside last week, 41 cars going forward as against 28 the week before.

Some planting of pineapple quince trees is reported from Porterville where the fruit is said to bring good prices and crops.

Five acres of young date seedlings in Coachella Valley were recently bought for \$5,000 by Dr. Duffield of Los Angeles county.

The directors of the Cloverdale Citrus Fair have decided that the opening date will be February 21. The fair will be open five days.

Heavy citrus planting is expected to follow in those districts of Tulare county which were not visited by frost during the past winter on the assumption that there is little if any danger in such locations.

The 340 date palms 10 and 12 years old which were moved from Heber to Indio are all thriving and the only set-back noticed was due to irrigation not going as deep as irrigators judged without digging.

The dreaded citrus canker has been found by E. H. Paddock, Horticultural Inspector at Santa Ana. It was received there in an advertising box of kumquats mailed to a Villa Park rancher from Mobile, Alabama.

It is said that Frank A. Tetley, the well-known Riverside nurseryman, who has extensive grove and nursery interests in North Whittier, will begin soon to dig and pack 16,000 lemon and orange trees for shipment to Donna, Texas.

Forty varieties of avocados growing on C. E. Needham's ranch in Los Angeles county all stood the frost better than Eureka lemons among which they were interplanted. The avocados were practically dormant while the lemons were growing thriftily.

W. L. Briscoe, general manager Sharyland Orchards Nurseries Company of Sharyland and Mission, Texas, was in Pomona last week buying nursery stock for his locality. He has contracted for 20,000 citrus trees. A car of ornamental stock was also bought.

An agreement has been entered into by the Southern California Retail Grocers and the Cal. Fruit Growers' Exchange whereby grocers in that part of the State will be supplied with the choicest of citrus fruit instead of being compelled to take large quantities of cull and other inferior fruit.

Citrus shipping was again started from Tulare county points last week, the water separators doing very satisfactory work in culling out the frosted fruit. Packing house people declare that the loss of Valencias will not amount to over 5 per cent and less than that where smudge pots were used.

About ¾ cent per pound to the grower for cull lemons is made possible while war prices last by the recent discovery of a commercial way to make U. P. citric acid at the Corona laboratory of the Cal. Fruit Growers' Exchange. It is now up to the company to produce commercially, a U. P. lemon oil. So far the experiments have failed to produce the fine aroma with their pure distilled lemon oil.

It is announced from Pomona that the days when orange packers made from \$6.00 to \$9.00 per day is a thing of the past. This year they are making from \$3.00 to \$3.50 on the average. The San Antonio Fruit Exchange is paying 3½¢ per box for packing and the independent shippers are paying 4¢. Instead of allowing the girls and women to crowd the fruit into the boxes as rapidly as they can, the managers are requiring them to wrap carefully and put a pig-tail twist on every wrapper.

DECIDUOUS FRUITS.

An apple institute is to be held at Yucaipa Feb. 28.

Almond trees at Banning are full of fat, vigorous fruit buds.

A considerable acreage of pears is reported to be going in around Colfax.

Fifty-four acres of peaches are being planted on the Silva ranch near Gridley.

Byron D. Beckwith is planting an 80-acre prune orchard on his newly acquired ranch near Colusa.

The Yucaipa Apple Ass'n has re-elected P. B. Hasbrouck president and Frank Dillon vice-president.

Almond spraying for brown mite and shot hole has been going on at Banning for two weeks. It is claimed that this also helps control of gumming of the nuts.

It is reported that J. F. Siems, who has extensive interests at Chicago Park, Nevada county, will plant 3,000 Bartlett pear trees at that place this spring.

The promotion committee of the Prune and Apricot Growers' Ass'n have asked for an extension of the time limit for incorporation from March 1, 1917, to May 1, 1917.

The Banning Almond Ass'n handled 235 tons in 1916, an increase of 35 per cent over 1915, due to additional acreage coming into bearing according to Manager R. H. Coombs.

Almond growers in the vicinity of Durham, Butte county, have purchased 10 carloads of smudge oil with which they expect to protect their orchards against freezing weather.

According to S. W. Baker of Sonoma county the prune acreage of that county is being materially increased by the interplanting of prune trees in hop fields and wine vineyards.

Three new apple evaporators are being built in the Sebastopol district this year to assist in handling the apple crops in that district. There are already over 100 evaporators in that district.

A severe slump in the prune markets of Santa Clara county is reported as a result of the war talk. Thursday of last week they were reported to be offered at 4½ cents for 40-60's for fall delivery.

Peach shipments from California, while not so large this season as in previous years, are bringing almost twice the returns to the growers that they have in previous years according to figures just issued by the California Peach Growers, Inc.

According to County Horticultural Commissioner Harry Lad of San Joaquin county, prunes will lead all other fruits insofar as planting in that county is concerned the present season. Already 500 acres have been planted there this year.

The plant of the Green Valley Canning Co. of Graton, Sonoma county, was leased last week to J. W. McCarthy, Jr., for a term of five years. Mr. McCarthy has been leasing this cannery from year to year in the past but expects to operate it on a larger scale from now on.

VINES AND VINEYARDS.

Imperial Valley Malaga grapes are being contracted for at \$35 a ton on the vine.

The vine pruners' strike in Fresno

ANNOUNCEMENT

---On and after Feb. 15, 1917, the prices of all kinds and sizes of SCHMEISER LAND LEVELERS will advance at least 10%

We will protect all persons on price who send in their order on or before that date, but urge prompt action, as we are behind in filling orders at the present time.

SCHMEISER LAND LEVELERS make a world of difference in the Work and Time and Cost of leveling land. We manufacture levelers suitable for any tractor or any number of horses. Write for literature.

SCHMEISER
Manufacturing
Co.,
12 Mechanic St.
Davis, Calif.

county continues to be a source of worry to vineyardists, no settlement having been arrived at as yet.

An increase in the grape acreage of Imperial county is expected this year by County Horticultural Commissioner Waite. There are 1010 acres of bearing grape vines in that county, most of which are table varieties.

William Gould, newly appointed horticultural commissioner of Yolo county, has completed the inspection of 100,000 grape cuttings, most of which will be planted by P. N. Ashley and E. W. Bray. Thompson Seedless and Sultanas are the varieties being planted.

County Horticultural Commissioners in the San Joaquin Valley are urging the passage of legislation which will make it compulsory for all shippers of green grapes to comply with the sugar test. The claim is made that many growers ship in lug boxes to overcome the present law, which only applies to crate shipping.

Practically all of the 1916 raisin crop has been cared for by the 34 packing plants of the Associated Raisin Co. and as a result they were all shut down last week for the season. Because of rain damage the 1916 crop was very little more than that of 1915, but prices have been good and very little of the crop will be carried over.

MISCELLANEOUS NOTES.

C. A. Robertson has agreed to give 100 acres to the Chowchilla Fair Association near the town of Chowchilla. It is understood that the land will be used exclusively for the holding of agricultural fairs.

The Board of Prison Directors have set the price of jute bags for 1916 at 10 cents each. This is one cent less than the cost of manufacturing Calcutta bags, it is said. It is estimated that the State will be able to deliver 3,000,000 to 4,000,000 bags this year.

At an enthusiastic gathering of farmers and business men of Napa county at Napa last week steps were taken toward the establishment of a Napa County District Fair. It was necessary to form such an organization in order to secure an appropriation from the State.

Announcement comes from Stockton that a third sugar beet company is to be organized in San Joaquin county at once. The new company will erect its factory adjacent to Stockton and will have both rail and water transportation facilities. It is their purpose to secure a large acreage of beets in the delta districts.

Water will be turned into the main canal of the Modesto Irrigation District at La Grange dam within the next few days, according to reports from Modesto. The ditches and reservoirs of the district are said to be in good condition, and with a heavy snowfall in the mountains a good run of water is looked for.

Announcement is made at Sacramento that Governor Johnson has reappointed the following members of the State Board of Agriculture: John M. Perry, Stockton; Chas. J. Chenu, Sacramento; T. H. Ramsey, Red Bluff; Theodore Gier, Oakland; E. Franklin, Colfax; E. F. Mitchell, San Francisco; I. L. Borden, San Francisco and E. J. Delorey, Los Angeles.

About 600 of the required 650 farmers of San Bernardino county had signed up for a farm adviser previous to Feb. 3. H. A. Cherrier, chairman of the Redlands Chamber of Commerce committee to secure a farm adviser, and State Ass't Leader C. W. Rubel had been holding meetings about the county for a week or more and the final arrangements are expected soon.

PRUNE MEN ELECT AND START WORK.

Returns from the final election of trustees for the Prune and Apricot Growers' Selling Association show the following men elected:

District 1: W. J. O'Connor, F. W. Wilson.

District 2: Henry Wheatley, H. C. Dunlap.

District 3: A. B. Abshire, P. W. Bussman.

District 4: T. S. Montgomery, H. G. Coykendall, F. L. Barnhisel, J. J. Stanfield, George Glendenning, Nathan Lester, A. Kammerer, J. S. Williams, S. E. Johnson, I. E. Pomeroy, Frank Swett, Henry Hecker.

District 5: E. F. Eggen, W. E. Riesland.

District 6: David Felsenthal, F. E. Bagnall.

District 7: J. W. Macaulay, Arthur Swall.

The first meeting of the trustees was called for Feb. 8 at San Jose for the purpose of perfecting a permanent organization.

HAY SCARCE AND HIGH.

The following reports have been received from Pacific Rural Press representatives during the past week regarding the hay situation: Fresno, alfalfa hay scarce, dairymen paying \$14 a ton loose in the stack; Kingsburg, alfalfa baled on ranch \$15 a ton; Imperial Valley, baled alfalfa in stack brings \$20 a ton with a very scant supply; alfalfa in

San Diego county selling for \$22 a ton, loose in the stack, and baled oat and barley bringing \$20 a ton on the ranch.

Nitrate of Soda

The most practical form of supplying **NITROGEN** to all crops. Easily applied and wonderful in results.

Increases Crops 25 to 50 per cent

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

HEAT DOESN'T AFFECT TRACTORS.

[Written for Pacific Rural Press.]

The market for automobiles in Imperial Valley may possibly be limited; for most everybody that has a roof to sleep under in rainy weather already has a car garaged under a shade of arrowweed, palms, or grass.

But the market for tractors ought to be tremendous; for only a few are yet in use, and the heat of summer makes the working of horseflesh inhumane. Folks tell us it is so hot in summer that even houseflies are under the weather and do not bother; but that is only relatively true. Some folks say it is too hot to stay in the Valley through summer; but that is not true, for we found many families in pleasant, comfortable homes, who hadn't been out of the Valley for years. They had such homes because they had stayed and attended to business.

Some folks tell our solicitors it is too hot to read in summer; but that is not true, for a large proportion of Imperial Valley farmers read Pacific Rural Press.

But we must agree that it is too hot to work livestock through the summer days; and we have found the crop system regulated to avoid summer work.

A man could fix an umbrella or awning over himself on riding implements and do ranch work in the heat. This is where the tractor comes to the rescue. With big fans and good radiator capacity, a tractor does not overheat even in Imperial Valley. If it did, an evaporation system could be worked on the radiator. A fan can be connected to the belt wheel to keep the operator cool as breezes can.

Needed for Seedbeds.—In all our conversations with farmers all over California, we have never found a place where careful seedbed preparation made so much difference as in Imperial Valley in a season of water shortage. Yet at the proper time for seedbed preparation, most folks think they are too busy to work the soil deep and fine.

With a tractor, a man does so much more in the same time that he keeps ahead of his work and keeps it done thoroughly. He is then in position to harvest maximum crops.

NOT ENOUGH WATER TO SUPPLY PUMP.

To the Editor: I have a well with a 12-inch casing, 101 feet deep. I figured on putting in a 20 h.p. engine, but finally decided to use ditch water for irrigation so put in a 4 h.p. engine with a No. 2 centrifugal pump having a 3-inch suction and discharge pipe. Now the water stands about 12 feet from the surface and my pit is 10 feet deep, so the water is about two feet from the bottom of pit. My pump is on the bottom of the pit, but the water pumps down so that I have to lift it about 16 feet and I do not get enough water to suit me. When they dug the well they passed through about a foot of water and sand at 60 feet, but I thought that might not furnish me with enough water so had them go deeper. A neighbor who bored a well and stopped at this 60-foot stratum has plenty of water with the same sized

engine and pump. I had thought some of perforating the well at that stratum. Is there danger of the well filling up with sand if I do so? The trouble is that in the summer when everybody is irrigating the water gets higher in the well, but as soon as I start pumping it pumps down and as soon as I stop pumping it raises about 10 feet in one minute. What can you suggest?—E. L., Merced county.

[Answered by Prof. F. W. Woll, University Farm, Davis, Cal.]

We have read carefully the description of the above pump installation. We do not believe that there is anything wrong with this installation and that the whole difficulty lies in the fact that the water cannot get through the well casing fast enough to supply the pump. We would be inclined to suggest a perforated section in the casing at the first water bearing stratum. One foot of sand and gravel is not adequate, but perhaps with a screen installed here to supplement, preventing the water coming from below, there would be enough flow to supply the pump. Whether or not the one foot of sand and gravel will be adequate depends largely upon the coarseness of the sand and gravel. The pump will not operate efficiently with such a varying lift as described and some change should be made.

CHEAP FARM ELECTRICITY AND WATER.

[Written for Pacific Rural Press.]

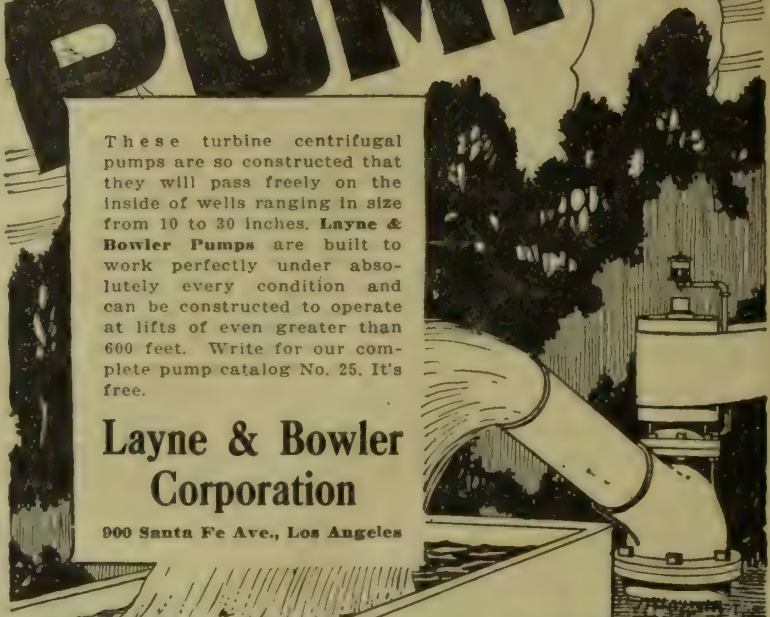

A three-horse-power gas engine runs a two kilowatt dynamo on the ranch of W. E. Gird in San Diego county to light the house and ranch buildings. From the other flywheel, a plunger pump is operated to supply water for house conveniences and fire protection.

The engine and dynamo are both on a concrete floor in an ornamental house which contains also a storage battery of 56 cells. Wires run through a tube imbedded in the concrete to the battery. The dynamo supplies a 16-ampere current at a pressure of 125 volts, which will light the ordinary incandescent lamps, of which there are about 80 in the new home which Mr. Gird has recently built in the hills, and perhaps as many more about the place and in the old home. Not over a dozen lights are ordinarily in use at once; but with the battery charged and the dynamo running, many more can be used at will. A sewing machine motor and vacuum cleaner are used; and of course electric flat irons, toasters, washing machines, etc., are available. The engine is started by turning electricity from the battery through the dynamo.

The well is drilled 96 feet deep; and supplies water to a 5,000 gallon concrete tank set higher than any of the buildings. Water is piped all through both houses for all modern conveniences.

Don't turn full power into an electric motor at once if a rheostat, or controller is used. This causes excessive heat, strains bolts and machinery, and consumes an abnormal amount of starting power.

Layne & Bowler PUMPS

These turbine centrifugal pumps are so constructed that they will pass freely on the inside of wells ranging in size from 10 to 30 inches. Layne & Bowler Pumps are built to work perfectly under absolutely every condition and can be constructed to operate at lifts of even greater than 600 feet. Write for our complete pump catalog No. 25. It's free.

RELEVELING ALFALFA FIELD.

[Written for Pacific Rural Press.]

There was a 15-30 tractor in the alfalfa field acting somewhat like a dog chasing its tail. The "tail" was a three-bottom moldboard gang plow and we thought the operator was demonstrating the tractor's agility.

Not so: it was performing stern work. The 150 acres on which it was working had been checked, and alfalfa had been grown on it for some years. But there were lots of high places where water could not be plentifully applied without drowning the rest. The ranch has since become the property of the Timken Ranch Co. and the high places are being leveled right. The plowman was kept busy regulating the depth of the plows; and when he got them too deep in that alfalfa sod he didn't raise them, but waited for the engine to take a breath and pull them out.

On the same field were about 20 teams of four horses or mules each, plowing and running scrapers. When we found that the tractor had done good service here for two years, we asked why they didn't have some more.

"There's another one coming," said the operator; and so it is on hundreds of Imperial Valley ranches.

LIKES WHEEL TRACTOR.

[Written for Pacific Rural Press.]

"If it is too wet to use my wheel tractor, the ground ought not to be plowed," says Warren E. Hyde of Santa Clara county. Mr. Hyde has 50 acres on which he uses his small tractor to plow, spring-tooth seven feet wide, slab-harrow 10 feet at a trip, and to pull a spike harrow. He mentions the light upkeep of wheel tractors, but does not seem to have any wet spots that must be plowed when the rest is ready. The effect of a tractor in mashing all clods before the end of the season is noted, where the ground is so thoroughly worked.

PUMPING PLANT SUPPLIES PASTURE.

[Written for Pacific Rural Press.]

A little pasturing in the middle of the day during the summer, supplied by a pumping plant, helps to keep up the milk flow and doesn't do much, if any, damage to the alfalfa, in the opinion of Simon Lanini of Monterey county who farms his own land.

To turn the cows directly into the alfalfa field with empty stomachs would be dangerous on account of bloat; so alfalfa hay is fed in the morning before pasturing is commenced. To leave the cows in the field long enough to give them all of the green succulent feed they need, would also be bad practice because of the harm done to the alfalfa. This is overcome by cutting green alfalfa and feeding it after it has wilted, that which is cut one day being fed the next day at the evening meal.

The conditions under which this practice has seemed advisable are, a well drained, sandy loam soil, where irrigation is done by pumping plant, cement supply pipes, and galvanized iron surface distributing pipes.

POWER NOTES.

A 25 h.p. tractor is used to run the alfalfa seed huller by C. C. Bowles of Imperial county. An extra advantage is that the huller may be quickly moved from stack to stack in the field.

We recently watched a plowman stick a tractor with six moldboards shoved deep into heavy stick soil. He simply waited while the tractor operator backed up and jerked several times, slipping the tracks and straining every bearing. Of course the repair bill on that tractor won't please the owner.

During the present winter there has been plenty of weather in California when it was the part of wisdom to drain automobile and auto truck radiators before leaving them to stand overnight. It has been noted that the radiator won't freeze in ordinary freezing weather if a cupful of wood alcohol is kept in it with the water.

Testing a carboned spark plug in open air does not tell what it will do in the cylinder. Under the pressure in a cylinder, the carbon may be compressed so it will conduct electricity between the points and thus prevent a spark, while in open air, the carbon may fill the space but be too loose to conduct the current, thus permitting a spark.

Is Beef Probable on Alfalfa Land?

[Written for Pacific Rural Press.]

There has been a growing interest for the past several years in the possibilities of alfalfa land for the growing of market beef; and this idea has continued to gain adherents as the acreage of alfalfa increased and the grazing of mountain and hill areas contracted.

There has never been any question as to the desirability of this practice, but rather as to its practicability, with land values as they now are in the State and where profits are the chief consideration.

Straight Alfalfa.—In reply to a number of questions concerning this phase of the cattle industry submitted to us by a subscriber, W. G. Stimmel, former superintendent of the Stanford University's ranch at Vina and one with considerable experience along this line, says, "I believe it is practicable to raise beef cattle on a straight alfalfa farm, but I have no figures to show that it would be profitable. As a matter of fact I do not believe that beef cattle can be so raised, except at a financial loss. I believe that under present market conditions the ranges offer the only possible opportunity to raise beef cattle alone at a profit."

"It is my belief that our only way out on the cattle business on the irrigated alfalfa land is through the dual-purpose cow and the baby beef. The dairyman may argue strenuously against this, but if this can't be done successfully then, in my opinion, we might as well dismiss from our minds all hope of making profitable beef on high-priced lands, with intensive cultivation. The present price of beef on hoof will not pay cost of production under such conditions."

E. W. Little, superintendent of the Whitehall Estates ranch at Tracy, where alfalfa and beef are both grown, is emphatic in his statement that beef cannot be profitably raised on alfalfa alone in California, and W. E. Premo, who feeds great numbers of steers on alfalfa near Porterville, is certain that it is not profitable to raise beef on alfalfa alone at present prices.

E. A. Noyes and Son of Sutter City, experienced beef raisers with

some alfalfa acreage, do not believe a straight alfalfa proposition is practicable, although they think it might be feasible if part of the alfalfa was irrigated and part of it on higher un-irrigated land, and supplemented with hay during the winter months.

Amount of Hay.—Answering the question as to whether some alfalfa should be fed as hay at all times of the year Messrs. Noyes, Little, and Stimmel do not think so. Mr. Noyes preferring to feed hay only during the winter and when preparing for market, while Mr. Little does not believe it an economical practice at any time. Mr. Premo on the other hand thinks some alfalfa hay should be fed all of the time. By feeding hay he thinks 100 acres will furnish feed for 100 cattle, but not if the alfalfa is pastured.

Pasturing Alfalfa.—The question as to whether cattle can be pastured some of the time on green alfalfa naturally brings up the old question of economy that is so often advanced by dairymen. Generally speaking, no dyed-in-the-wool cattleman will hand-feed cattle, when pasture is available, for it is an old saying among them "that the less farming you do the more money you will make." It is probably on that basis that both Mr. Little and Mr. Stimmel think pasturing advisable, as does Mr. Noyes also, who further advises not to feed more than an hour a day for the first few days and never while there is dew on the alfalfa. Some, he says, prefer to feed some hay in the morning just before turning onto the alfalfa pasture and this is no doubt the safest way to prevent bloat.

Supplementary Feed.—While all of the above answers leave little doubt as to the impracticability of raising cattle on alfalfa lands, there is some difference of opinion as to what other feed, if any, should be raised if cattle raising under such conditions is contemplated.

Mr. Stimmel says this: "I would not raise other feed under such conditions unless rotation was necessary. As long as my alfalfa yields were good and the condition of the soil right for alfalfa I would not attempt to raise supplementary feed, but would buy such feeds and by so doing, through careful disposition of the fertilizer, maintain productivity of my alfalfa land."

Messrs. Noyes, Little, and Premo do not quite agree with this doctrine, Mr. Noyes saying that "for a small herd, corn or rolled barley can be fed successfully; for a large herd, would use oat or barley hay as a part of the winter feed and when finishing for the market." Mr. Premo would raise silage corn and some small grain and Mr. Little would grow carbonaceous soiling crops together with corn, barley, and oats. This is only practicable though, he thinks, with purebred animals, for intensive management must be compensated by quality and breeding prices.

Range and Alfalfa.—Probably the most practicable manner of including alfalfa in the production of beef at the present time, is to use it in connection with some range or mountainous area. The amount of land

Buy Berkshires from Leading California Herds

PUBLIC SALE

Davis, Cal.

February 15, 1917

Sale under the auspices of

The Western Berkshire Congress

A committee will inspect the entire offering, and will not allow any animal to be sold that is not a worthy representative of the breed. This insures an exceptionally high quality offering.

Berkshires have proven in the strongest competition that they are the logical breed for the West. No such opening will be offered this season for procuring different lines of breeding from prominent herds at your own price.

This sale will be preceded by a two days' meeting, February 13th and 14th.

Arrange to attend the meeting and sale. Everybody invited.

If unable to attend, send mail bids to L. E. Frost, editor of The Berkshire World, Sales Manager. For further particulars address either the Secretary or the President.

W. S. GUILFORD, Pres.,
Willows, Calif.

F. R. STEEL, Sec'y.,
Grant's Pass, Ore.

The Western Berkshire Congress

of each kind required for the maintenance of 100 head of cattle would depend entirely upon the character and quality of the range, that is, the quality and quantity of the grass or wild feed, and the quality of alfalfa land, water supply, stand of alfalfa, in short the annual yield of feed.

That there is a difference of opinion on this question is evident from Mr. Noyes' reply in which he says that 100 to 125 acres of alfalfa, subdivided, and 250 to 300 acres of good range land should furnish feed for 100 head. Mr. Premo believes that 10 acres of range to one of alfalfa would be about right, and Mr. Little thinks that 50 acres alfalfa, 500 acres of good range and 300 acres of rented stubble land would make the best combination for 100 head.

It should be understood that the above comments have to be solely with the profitable raising of beef cattle on alfalfa lands as found in California today and do not take into consideration possibilities for the finishing of range-raised beef on alfalfa. That also is a much-discussed question which some few are finding it exceedingly difficult to prove or disprove. It seems probable, however, that it is the brightest star in the alfalfa-beef raisers' horizon.

CREAM MAKES STRONG BUTTER.

To the Editor: We have a cow which makes strong butter. Her milk seems good and the cream is good till I commence to sour it for churning. She is fed on alfalfa hay, bran mash, and we put her out on the grass every day. She is three years old. Has had her first calf. Will be fresh in May, again. I keep the milk in a screen porch where there is nothing else kept. She seems well and eats good. The older the butter is the stronger it gets. Can the cream be churned sweet?—Mrs. H. W. Lankerheim.

[Answered by F. W. Andreasson, Secretary State Bureau, San Francisco.]

There are cows that give bitter milk sometimes. In such cases the udder or one quarter of the udder has been found to be affected. By taking a little milk from each quarter of the udder and placing it in sterile fruit jars or bottles it could be ascertained whether this was the cause of the trouble.

Where milk is placed in milk pans to allow the cream to rise by gravity the temperature of the room should be kept at from 60 to 62 degrees F. and the milk should be sour and ready to skim in 36 hours. The cream is then ready to churn. Where the room in which the milk is stored is kept at a low temperature (50 to 58 degrees F.) it takes too long before it is ready to skim. As the lactic acid bacteria develop very slowly at this temperature other bacteria which develop disagreeable flavors predominate.

Some creameries churn the cream sweet. It is then churned at a low temperature and takes longer to churn.

Feeding Whole or Rolled Rice.

To the Editor: Several successful experiments have been reported in feeding rolled whole rice to both dairy cattle and beef cattle. As we are uncertain as to the exactness of these claims, also the feasibility of feeding such rice on account of the hulls, which seem to be a large part of the product, we should very much like to have your advice on any damage these hulls might possibly do to the stock.—J. C. L., Alameda Co.

[Answered by Prof. J. Davidson, University Farm, Davis.]

Considerable ground or rough rice has been fed in the past in Southern States, and there are also reports of its having been used for stock feeding in this State, especially for dairy cows, with no ill effects, so far as I have been able to learn. The hulls are, of course, undesirable components of any feeding stuff, both because they are intrinsically useless as feeds and through their roughness and sharp anatomical structure they irritate the lining of the alimentary tract of the animals and may cause impaction of the bowels when eaten in considerable quantities. There is, however, no danger in this respect so far as is known, when cattle do not get any more hulls than naturally go with the rice kernel. The danger that has sometimes come as a result of feeding by-products containing rice hulls, has been due to the presence of an excessive amount of hulls therein. Unfortunately, unscrupulous rice millers and dealers have often in the past diluted rice bran or rice feed with large amounts of ground rice hulls, in order to get rid of and make something out of this waste product that accumulates in large amounts at the rice mills. The result has been equally damaging to

the reputation of these feeds and to stockmen that bought them. At the present time, when the California rice industry is in the process of development, our rice millers can adopt no better policy than to deal honestly with their customers and sell only pure unadulterated goods which can be fed to stock with safety and profit.

Rough rice (so-called paddy rice), or rolled or ground whole rice, may be used for feeding farm stock to advantage, where it can be obtained at a fair price in comparison with other feeds. Its feeding value is somewhat lower than that of barley, as is indicated by the chemical composition of the two cereals. Rough rice contains about 73 per cent digestible matter (4.7 per cent digestible protein; N. R., 1:14.6), against 85.3 per cent for barley (9.4 per cent digestible protein; N. R., 1:8.1). It is a more starchy feed than barley, but compares rather closely with dried beet pulp in chemical composition and contents of digestible nutrients.

As in the case of most grain feeds, rough rice is preferably fed mixed with other feeding stuffs, and if it makes up not more than one-third or one-half of the grain mixture, it will be likely to be worth nearly as much as other standard grain feeds, pound for pound. Rough rice has been used to some extent for feeding cattle, sheep, pigs and chickens. It is less adapted for feeding swine than the other class of farm animals, and should be fed in moderate amounts to them, say not to exceed one-third of the total grain feed given.]

Will Dairy Shelter Pay?

Is it going to be good business for the California dairyman to provide some kind of shelter for his cows during the cold stormy winter months instead of allowing them to stand in deep mud and shiver from the cold?

Frequently we have asked practical dairymen this question during the past winter and always we have been answered in the affirmative, sometimes very emphatically, as was the case with F. Stenzel, of San Lorenzo, large Holstein breeder and market milk producer.

Previous to the present winter Mr. Stenzel has spent much time and money grading and graveling his corrals in order that they might be free from mud, and while he succeeded better than most do under like conditions he still had to contend with mud and, what was more important, a falling off in milk of two to three 10-gallon tanks in the daily yield.

To overcome this he erected last fall a large shed, having a good galvanized iron roof equipped with ventilators and a closely laid plank floor. One side of this building was left open and openings were left at regular intervals in the other side that the sun might gain access to the building in clear weather. Through the protection afforded the cows by this building Mr. Stenzel says he has been able to keep the milk flow of his entire herd up to the normal

amount produced in clear weather.

A cheaper form of shelter was shown in a recent illustration of Bohnett Bros' dairy, on the front page of this journal. They consider that cold weather is as costly to the milk flow as wet weather and muddy corrals, it having been their experience before erecting the shed roof, that the cows fell off in their milk worse in cold weather than they did in wet weather. Another factor which makes the shelter more desirable than any form of corral surfacing one can do is the conservation of manure, which is no small matter in itself.

MAKING SUDAN HAY BETTER

[Written for Pacific Rural Press.]

Sudan grass can be made to produce a much finer grade of hay by sowing it thick, thinks R. R. Henderson of Kings county, who has several acres planted to that crop this year.

He sowed his seed this year the last of April, using 15 pounds to the acre broadcast. On a few spots where alkali was prevalent, it did not do well; but on the good land it had produced two heavy cuttings August 1, and was expected to grow another crop. He has noticed that the best quality of hay was secured where the seed was sowed thickest; and another year will use plenty of seed.

Breed for Butterfat

Beryl Clothilde Hengerveld, Champion in Butter-fat Contest, Sacramento, 5-day record, 21.11 pounds, test 4.7 per cent.

The quickest and surest way to make your Holstein herd more profitable in spite of high cost of feed is to introduce blood from high-testing ancestry.

My herd has a larger percentage of high-testing cows than any other herd in the State.

My young herd bull, DUTCHLAND SIR PIETERTJE CREAMELLE, has high-test breeding, and is transmitting this breeding to his sons and daughters. Five tested daughters have records averaging 21 pounds, all testing better than 4%. One of these, Clothilde Pontiac Creamelle, is California Champion 2-year-old, with a record of 22.52 pounds at 2 years 1 month; test 4.72%.

Have a few fine young bulls that will soon be ready for service.

WRITE OR CALL AND SEE THEM.

F. STENZEL

Breeder of High-Test Holsteins.

SAN LORENZO,

CALIFORNIA

GRANDSONS OF TILLY ALCARTRA

We now offer two young bulls for sale that are old enough for service. No. 1—Born Sept. 13, 1915.

Prince Alcartra Korndyke. Best bred son of Tilly Alcartra.

No. 2—Born Sept. 3, 1915. His dam is a heavy producer and will be put on test next time she freshens. His full sister has a record of 19.36 in 7 days at 2 years 6 months and will also be kept on test for the year.

The bulls are nicely marked, have perfect top lines, are good individuals and both sired by Prince Alcartra Korndyke, who now has 6 A. R. O daughters and more coming.

Write for prices, or better come and see them.

"THE NAME GIBSON INSURES QUALITY."

Marketing Stanislaus Hogs Direct.

[Written for Pacific Rural Press by Otis L. Linn, Modesto.]

The value of co-operation has been pretty thoroughly demonstrated by the farmers in the Modesto section of Stanislaus county by the actual cash benefits they have received in marketing their hogs together.

Since September 20, 1916, when the first car was shipped there have been 12 cars of hogs handled co-operatively with an actual net saving of \$50 to \$150 per car, which has gone directly to the farmer. That is, these farmers through co-operative shipping of their hogs have received that much more than they would if they had accepted the highest price offered by the local buyers.

Farmer's Agent.—The working plan by which this has been made possible is very simple and could be duplicated in any district where there are sufficient numbers of hogs to justify the effort. In this case the Stanislaus Farmers' Union appointed an agent whose business it is to create an interest in co-operative shipping and as soon as a carload of hogs have been promised the farmers are notified just when to assemble them at the shipping point.

On the given date the hogs are all

ment is made each shipper is paid the total amount his hogs brought, less the actual cost entailed in the shipment. The agent who manages the shipment is paid so much a car, usually from \$10 to \$20.

The expense of shipping a car of hogs from Modesto to San Francisco, including a shrinkage of about 15 pounds on each animal, amounts to just about three-quarters of a cent per pound, but even at this the farmers have been paid, on the average, a dollar an animal more than they could have received by the old method.

Troubles.—Of course there are disadvantages under which the method of shipping must labor, such as shrinkage, failure of farmers to bring in their hogs as agreed upon, poor transportation advantages (sometimes as much as 14 hours being required for the shipment to arrive in San Francisco from Modesto, a distance of 100 miles), and not least of all the fact that the hogs must be practically sold when they leave the shipping point. These disadvantages will doubtless be overcome in time by better organization

HOG SHIPPING DAY AT MODESTO.

Each carload contains several consignments, some large and some small, as is indicated by the various sized vehicles used.

brought in to the railroad corrals, weighed, marked and turned over to the shipping agent who accompanies the car to market. The marking is done by simply clipping a spot on some particular part of the hog, each consignor being given a separate mark.

When the hogs arrive at the packing house they are separated and each consignor's shipment graded, and sold separately. The packer butchers the hogs in separate lots and each shipper is given credit for any premiums due to high butchering percentages, or charged if per chance the government inspector condemns any for disease. Half of this latter charge is sustained by the packer after allowance is made for the usable parts of the carcass.

Expense.—When the final settle-

among the producers, compelling, if need be, better transportation facilities and a centralized stockyards where the element of competition may have a larger scope.

Advantages.—Some of the advantages of this method of shipping may be enumerated as follows: actual cash demonstration to the producer between the good hog and the poor one; an actual reduction in the number of middlemen; education of the producer that it pays to produce good animals for the market.

On the whole, the farmers of this section, having shipped the first car of hogs co-operatively ever marketed in California, feel that they have an experience to offer that will help to bring about the solution of the much discussed marketing situation of livestock in California.

For a Kicking Cow.

A contrivance that effectively prevented the cow from kicking, yet was easily made and applied or removed, was recently seen in use. Two strap irons about 2x4 inches had been bent in the middle so they would fit snugly over the cow's legs just above the hock. On one, a chain was fastened by a wire which laid flat against the cow's leg and had its ends fast to the corners of the outside end of the iron strap. On the other, a wire was

hung in the same way but so shaped at its middle that any link of the chain would fit into it and be held by pressure of the next link against the wire.

The dairyman said that this sometimes slipped off, but it wouldn't if it were an inch longer on the inside end. He suggested using harrow teeth in place of the iron straps, fastening a short chain to the pointed end of each tooth and bending

TREWHITT'S BIG TYPE POLAND CHINAS

The blood lines of the herd are unexcelled, the foundation stock having been secured from the Topnotch Herds of the Middle West. Sows of fine quality, yet big and roomy. The sort that have large litters of vigorous pigs.

Offering for sale a choice selection of gilts, boars and bred sows.

W. D. TREWHITT,

HANFORD, CAL.

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW,
P. F. I. E. 1915; Sacramento, 1916.

For many years at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Young stock, \$30 Up.

IOWANA QUEEN, 29th
224799

This sow was bred by Iowana Farms, Davenport, Iowa, farrowed Sept. 1, 1915, sired by Iowana Rival Champion 2nd 194729 out of Iowana Queen 2d 188557.

When Harry Murphy left for the National Show at Omaha last year he was to bring out a gilt or two for our herd that would show good on the circuit next year, and to pay a neat price if necessary to get the right kind of stuff. He shipped two Iowana gilts from the Berkshire sale at Omaha. Iowana Queen was one of these, and we are selling her at a sacrifice to our herd.

She is royally bred and she has a wonderful conformation, splendid head, depth and length, large hams and smooth shoulders—well, she is a real Berkshire and bred to a real boar. She will start some one in the Berkshire business right.

end of one chain would hook into any link of the other chain, required to hold the hocks close together.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING.

A cow 13 years old finished a year's record about Nov. 11 of over 456 pounds fat, for F. H. Van der Pool of El Centro. She freshened again Jan. 22, 1917.

A bacteria test of 5,000 c.c. was obtained in Los Angeles recently on two counts of cream shipped there by J. D. Houston of Imperial. His usual test runs about 10,000 per c.c.

A San Francisco company is endeavoring to sign up 1,000 cows in the Manteca section of San Joaquin county in the hope of establishing a casein factory at that place.

Preparations are now under way for the installation of the milk condensary machinery at the large Borden plant recently completed at Modesto.

D. & H. Rowles of Stanislaus county have recently sold five registered Holstein cows from their herd to Walter Schmidt of Hughson for foundation purposes.

L. E. Prestage of Tulare county has recently purchased from Tulare county parties eight registered Holstein cows and four registered heifers as a foundation herd for his ranch near Plano.

Because he had plenty of silage and pasture for his 120 dairy cows G. V. Rude of Imperial county has been able to sell 40 to 50 tons of alfalfa hay from his ranch for \$20 a ton baled the past month.

The N. H. Locke Co. of Lockeford reports the sale of registered Jersey bulls to the following parties during the past month: one to F. W. Bush, Fair Oaks; one to Mr. Ward, Orland; and one to A. W. Maguire of Fresno. They were all descendants of King's Valet and out of dams of extremely high quality.

A record butterfat production for the Gridley Cow Testing Ass'n was made last month by the registered Holstein cow Piebe Laura Inka De Kol, owned by J. H. Guill, Jr., by producing 1630 pounds of milk and 86.4 pounds fat. There were eight other cows in the association which made better than 45 pounds of fat.

Seven cents a pound above Los Angeles butter quotations has been paid regularly for fat in whole milk by the California Central Creameries Co. at El Centro and it was recently reported that they had raised the price to 10 cents above Los Angeles. This is so that they may obtain milk to make into casein at their new factory.

The highest producing cow in the Sacramento-Yolo Cow Testing Ass'n for January was a grade Holstein owned by John Herzog of Courtland, according to advice supplied us by C. C. O'Hara, tester for the association. Her monthly production was 1197 pounds milk and 50.2 pounds fat. Twelve cows in the association made better than 40 pounds of fat during the month.

We are advised by H. E. Spires that he has recently moved his herd of 27 registered Holstein cattle and his purebred Duroc swine herd from Kansas to his Fresno county ranch where he will raise purebred stock exclusively in partnership with Dr. J. M. Crawford. Their herd sire is Sir Piebe De Kol Segis Pontiac, a good son of King Segis Pontiac Count of Andrews Farms fame.

The five herds which led in production of butterfat in the San Joaquin Cow Testing Ass'n during January were: F. Kell, 9 cows with an average of 32.1 lbs. fat; E. B. Goodwin, 51 cows with an average of 31.7 lbs.; M. C. Gammon Est., 27 cows with an average of 30.6 lbs.; H. Bailey, 37 cows with an average of 29.4 lbs., and the County Farm, 35 cows with an average of 28.8 lbs. fat. There are 800 cows on test in the association.

SWINE.

Four carloads of fat hogs have recently been shipped to Kansas City from Imperial county to be used in the manufacture of hog cholera serum.

We are in receipt of an instructive sales catalogue of Berkshire swine issued by Silver Birch Farms of Newport, Washington. More breeders should use this method of following up their advertisements in farm papers.

Haden Smith, Duroc breeder of Yolo county, reports the sale of 17 bred sows to Chas. E. van Barneveld, Glenn county; a boar to A. J. Gomes, of Calaveras county; and a service boar to Joe Hulén of Solano county and a gilt to F. W. Marston of Shasta county.

A dispatch states that farmers along the Sacramento river in Glenn county are fattening hogs on bass, shad and salmon. The first, the report says, are sucked into the irrigation canals by the water pumps where they die when the canals are emptied during the winter months.

Normandy Farms of Visalia has sold the registered Berkshire Capital R. sired by College Robinhood and out of Majestic Duchess B, to S. Usuka, a Japanese dairyman of Fresno county. Capital R. was one of the foundation animals in the Normandy Farms and has produced some outstanding pigs.

R. H. Whitten of Glendale has just issued one of the most attractive purebred swine catalogues ever gotten out in the State describing the hog industry in general and his ranch in Tulare county and his registered Poland Chinas in particular. Mr. Whitten now has one of the largest herds of purebred Polands in the State.

R. M. Whitten, owner of the Whitten Ranch at Terra Bella, advises us that he has recently bought the Poland China boar Jumbo Model, a son of Big Smooth Model that has been used as herd sire in the herd of Chas. Herring of Nebraska. He will be used on the daughters of Mouw's Long Smooth Jumbo now in the Whitten herd.

The members of the Kings County Poland China Breeders' Ass'n are sending out invitations to Poland China breeders in all parts of the State asking them to be present at Hanford March 7 when an attempt will be made to organize a State Poland China breeders association. The Kings county breeders will hold their auction sale on the same date.

Model A. D., the Duroc herd sire on the Cocapa ranch of the Timken Ranch Co., was the grand champion at the Imperial Valley Livestock Fair. He has a fine arched back, deep, medium-long body, with hams carried well down and as broad as his shoulders. He was brought from the East to breed to most of the 80-odd purebred sows bought for this ranch from the Peters, Lamson & Walker herd.

The Carruthers Farms of Mayfield has received from I. N. Barker, Thornton, Indiana, the great Berkshire brood sow Rival Lady's Goods, sired by Rival Champion. This sow is the mother of Hamilton Farms grand champion sow at the last International. She is also the mother of the grand champion sow of the National Swine Show held at Omaha last year. A Chicago report mentions her as the greatest Berkshire brood sow in the world. She is due to farrow in the early part of March.

BEEF CATTLE.

Experiments are to be tried out in Nevada with sunflower silage, which is said to be a good cattle feed by government authorities.

Beef cattle growers in Mendocino

K. W. Abbott Wins Rural Press Prize

K. W. Abbott of Milpitas, Santa Clara county, was winner of Pacific Rural Press monthly prize of \$25 for January for the highest production of five grade cows entered in the California State Dairy Cow Competition headed by a purebred sire. Prof. F. W. Woll advises us that the average production of these cows was 1436.5 pounds of milk and 56.605 pounds butterfat (average test 3.9 per cent) 54 days after calving, on the average, from the beginning of the month.

county have organized the Mendocino Stock Men's Ass'n during the past month to combat the work of cattle thieves operating in that district.

A bill has been introduced into the Nevada Assembly calling for the use of one bull to every 30 head of breeding cows or fraction thereof in a herd on public range. The bill must also be registered.

Alfalfa and barley finishing of beef steers is becoming more prevalent on ranches near Porterville, and farmers are securing a premium for steers fed in this manner. Recent sales of nine cents on foot are reported from there for steers fed in this way.

SHEEP AND WOOL.

According to a dispatch from Porterville local sheepman there are being offered \$6 a head for their spring lambs and 32 cents a pound for their spring clip of wool.

A dispatch from Colusa says that F. J. Mendosa of that place has sold 60,000 pounds of wool for 33 cents a pound. He refused, however, to contract his lambs for June delivery at \$6.50.

Utah reports say that a severe loss is expected by sheep men on the desert of Tooele county because of the extreme cold weather. Estimates are being made that the loss will amount to 100,000 head unless warmer weather arrives shortly.

Reports from Merced, Stanislaus and San Joaquin county sheep growers are to the effect that a good percentage of lambs is being secured in spite of short feed. Rain is needed, but they believe they will be able to get through the season all right with little more or none at all.

An organization to be known as the Northern California Wool Growers' Association was formed at a meeting of prominent sheep men of Tehama and Glenn counties Jan. 22. Their purpose is to combat unfavorable legislation and co-operate with the Forest Service in laws governing grazing in the National forests. Fred Ellenwood was elected president, G. B. Willcox, vice-president, and A. E. Bell, secretary.

HORSES AND MULES.

John Burrell, the well known jack and jennet breeder of Kings county, has recently sold a high-priced jack to Adolfo Camellero of Ventura county.

H. B. Thornberry has just got back to Stockton from Missouri with four carloads of jacks which he purchased for Pacific Coast distribution. He is establishing a branch office at Spokane.

MISCELLANEOUS NOTES.

A shipment of 45 cars of livestock was recently made from Imperial county to Los Angeles which is said to be the largest shipment of its kind ever made from the valley.

A company to be known as the Tassajara Land and Livestock Co., capitalized for \$1,000,000, has filed articles of incorporation in Alameda county. The company proposes to establish a 7,000-acre ranch near Pleasanton.

Word comes from Washington, D. C., that the Department of Agriculture has decided not to establish an animal quarantine station at San Francisco on the grounds that there is such a comparatively small number of cattle importations at San Francisco that the expense is not justified.

A total of \$9,000 has been subscribed of the \$14,000 necessary for the purchase of suitable grounds near Fresno for the erection of a meat packing plant. It is said that attempts to establish a co-operative plant have been given up and that instead a Chicago concern will erect the plant.

Reports from Winnemucca, Nevada, say that notwithstanding the severe weather cattlemen are experiencing in that section, their stock is going through the winter in good shape and only minimum losses are expected. A large number of sheep are being grazed on the deserts and the balance are being fed grain and hay.

BERKSHIRE MEN MEET NEXT WEEK.

The 1917 livestock sale season in California will begin next week at the University Farm at Davis, when the Western Berkshire Congress will hold its sale of 50 bred sows in connection with a three days' meeting of that organization.

The details of this meeting and sale have been carefully worked up by the directors of the association, initial steps for which were taken immediately after the State Fair sale last year, and it is expected that the three days' session will be one of the largest attended events of its kind in the West.

The Berkshire men have a habit of cutting into the core of their troubles at all of their meetings, instead of throwing bouquets at one another, and with several out-of-State speakers, including A. J. Lovejoy, a national authority on swine, this meeting should bring out much of educational value to breeders and farmers alike.

The sale is looked upon by Berkshire men as the event of the year in California swine circles, the offering being composed of consignments from 15 prominent herds of California, Washington, Illinois and Oregon. A step in the right direction which has been made by the association for this sale was the appointment of a secret committee of three to inspect all animals before the sale in order to insure a uniformly high class lot of hogs. A feature of the meeting will be the women's judging contest, seven silver trophies for which have been provided. W. H. Hord of San Francisco will cry the sale.

CATTLE FEED FOR SALE

I have both wild feed and hay to be sold together, and fed out by owner. Write me at once for prices, etc.

JAS. McCORD,

Hanford, Cal.

DUNLAP SECURES GOOD HEREFORDS.

Writing from Omaha, Neb., R. M. Dunlap states that he has purchased for the Simon Newman Co. at Newman, the grand two-year-old Hereford bull Bonnie Brae, who is an intensified Bonnie Brae bred bull out of the dam of the bull a year older that sold last June to O. Harris and Sons at public auction for \$11,100. Mr. Dunlap writes that this is a great bull, full of quality and weighed 2800 pounds when 28 months old, also that he believes him to be the highest-priced bull that ever came to the Pacific Coast. He has been bred to many of the best cows in the Wm. Andrews' herd. Besides this Mr. Dunlap has purchased three yearling bulls for the same firm.

STENZEL'S HERD SIRE A PRODUCER.

F. Stenzel, Holstein breeder of San Lorenzo, informs us that another two-year-old daughter of his herd sire, Dutchland Sir Pietertje Cream-elle, has made a seven-day record under official test of better than 20 pounds of butter, with a test of 4.48 per cent fat.

This makes five daughters of this bull which have made 20 pounds or better in seven days and all have had a test of over 4 per cent fat. As only six daughters of this bull have freshened and the other one made better than 15 pounds of butter in seven days as a two-year-old, Mr. Stenzel believes he will be able to develop some record-breaking daughters of this bull.

LIVELY TO SELL HEREFORDS.

We are informed by D. O. Lively that he will hold an auction sale of purebred Hereford cattle at his ranch near Mayfield on May 3. Mr. Lively is still in the East, where he is purchasing a number of high-class females for this herd. He also advises us that he has secured a young herd sire from the Hereford herd of Warren McCray.

A lame foot will be pointed forward when the horse is at rest. If two feet are sore, they will be pointed alternately.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

SWINE.**Poland Chinas.**

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

SEND FOR FREE CATALOG—Finest ever issued. Tells of the famous Whitten Ranch money-making strain of Big Type Poland-Chinas. REGISTERED SHIRES—Black Hawk Stock Farm. Importers and Breeders, Easton & Ward, Proprietors Burlingame, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT Co., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Redwicks, or San Francisco banks. Office, 319 Underwood Building, 525 Market St., San Francisco.

LIVE STOCK INSURANCE—Registered live stock and farm work horses should be insured. The Hartford Company, strongest in the world, writing live stock. No trouble to answer questions. D. O. Lively, special representative, 215 Hobart Bldg., San Francisco.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

Gertie's Son, Victor, No. 123159.
Dam, Victor Lady Lake (R. O. M.)
of 536 pounds butter in 303 days
as a 4-year old.

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on
Blatchford's Calf Meal than on all
other milk substitutes combined.

100 lbs. makes 100 gallons of milk substi-
tute, costing only one-third as much as milk.

Prevents scouring and insures the early
maturity of sleek, handsome calves.

It is steam-cooked and no trouble to pre-
pare or use.

University Sheep Also Winners.

While the winning of Champion
and Reserve Champion steer honors
at the Chicago International Live-
stock Show was in itself a feat that
the University of California as well
as all Californians may well feel
proud of, additional honor is re-
flected in a report of the Interna-
tional issued by Clay Robinson Co.
of Chicago, commission merchants.

It has been the practice of this
concern for many years to offer
\$1,000 in prize money to agricul-
tural colleges for the best exhibits

of fat hogs, cattle and sheep, and in
the report mentioned it is shown
that the University of California was
awarded \$305 of this prize money as
against \$180 to the Kansas Agricul-
tural College, the next largest prize
winner.

The large winnings of the Univer-
sity of California in this division
was largely attributable to their win-
nings on sheep—best wether, best
wether lamb, champion wether, and
the best pen of five wethers, all be-
ing won by the University.

Hogs and Calves Combined.

[Written for Pacific Rural Press.]

Cheap hogs and calves are raised
and fattened by C. J. Ellis of Poway
Valley, San Diego county. He raises
corn and feeds it ground with ground
barley in a soaked mash to fatten
the animals. The corn is drilled in
June, extra thick. It is thinned out
to three feet apart as needed for the
hogs, of which he now has 30 about
ready for market besides the breed-
ing stock. Suckers and tops are also
fed later. Pie melons are fed the
year around. One vine produced 60

melons. They can be bought at \$1
per ton.

Mr. Ellis also makes a business of
buying dairy calves from neighbors,
putting as much as five on one cow,
fattening them on ground corn and
barley, and selling them at about
100 pounds to a local butcher who
comes to the ranch, butchers the
calves there, pays 12 to 15 cents per
pound for them dressed and leaves
the hides for Mr. Ellis, who thereby
realizes another profit.

A Simple Milk Record Cabinet.

Keeping milk record sheets clean
of fly specks and finger marks is a
continual source of worry to all who
keep milk records and bothered
Bohnett Bros. of Santa Clara county
till they devised a record sheet cabi-
net. This cabinet is nothing more
than a small board box equipped
with two wooden rollers, similar to
towel rollers, one end of each ex-
tending out of the side of the box
so that they may be turned back
and forth.

The milk sheet is rolled up on one
of these, like a kodak film, and the
other end fastened to the other
roller. The box is equipped with a
partition through the center, over
which the milk sheet runs, this par-
tition affording a solid place for
marking down the figures. Except
for this middle space the front of
the box is enclosed with glass, which
protects the sheet from dirt and at
the same time makes easy reading
of several days' records possible.

Sudan for Sheep Pasture.

To the Editor: Would you advise
me to put in for pasture for sheep,
Sudan grass or sorghum? Either
can be irrigated.—C. H., Denair.

[Answered by Prof. Robt. F. Miller,
Univ. Farm, Davis.]

Sudan grass would be very su-
perior to sorghum as a pasture for
sheep, sorghum being too coarse for
a desirable pasture crop. Sudan
grass has been proven to be entirely

adaptable for raising sheep with good
results. It is usually, however, best
to take off the first cutting as hay,
then irrigate and allow the sheep on
the pasture as soon as the grass is
6 or 8 inches high, providing irri-
gation is possible. It is not neces-
sary, however, to irrigate the Sudan
pasture as this is a dry-land crop,
although irrigation helps the yield.

Alfalfa-Meal-and-Molasses Ration.

To the Editor: What results do
you think I would get by feeding a
ration of about 30 pounds of alfalfa
meal sprinkled with stock syrup and
about five pounds of grain included,
for a cow with fairly good pasture?
—Subscriber, Riverdale.

[Answered by J. M. Bomberger,
Modesto.]

The writer does not state the size
of cows nor what the cows are pro-

ducing, but it is hardly probable that
a cow on good pasture would eat as
much alfalfa meal as suggested. The
proportion is good, but the average
cow would eat less of it on fair pas-
ture. That mixture is most relished
by the cows if moistened just enough
to settle all the dust; also in that
way there is no loss of molasses by
seepage from the feed.

BUTTERMILK FOR CALVES.

Because he sells whole milk and
does not have skim milk for calf
feed, H. Mini of Solano county has
been using pasteurized buttermilk,
purchased at the creamery, for the
past four or five months with good
results.

In changing from whole milk to
buttermilk Mr. Mini uses the same
precautions that he formerly did
with skim milk, adding the butter-

milk to the whole milk gradually
and reducing the latter till finally
the entire ration is made up of but-
termilk.

Besides the saving of feed Mr.
Mini states that his calves are
healthy, no trouble being experi-
enced with scours or other diseases
and when fed in the same amount
that he previously fed skim milk he
finds that his calves always have a
keen appetite and keep in good grow-
ing condition.

The Book of Dairy Books

It's the book, because it's the au-
thority on the breed—the beauti-
ful, ever-paying Jersey.

This book, "About Jersey Cattle," goes
way back to the beginning of the breed,
shows how it was line-bred and protected
from mixture by law, and shows why it
has developed into the most economic
and most persistent milking of all breeds.
It gives tests, yields, etc., proving that
the Jersey is the money cow—the "Giant
of the Dairy."

The book is free but worth a lot. Send
a postal for your copy today.

The American Jersey Cattle Club
320 West 23rd Street, New York City

Comfort for Cows

Keep the cow's udder free from irritating conditions and the
milking will be easier, the yield better. Bag Balm is a soothing,
penetrating ointment that quickly heals all cuts, chaps,
ruives, sore cracked or injured teats. A sure relief for
sore teats, and useful in treating lumps and stricture.

Large 50c package, sold by druggists and feed
dealers. Ask for free booklet, "Dairy Wrinkles."

VETERINARY QUERIES.

[Answered by Dr. H. E. Wintringham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for \$1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

COW WEAK IN BACK.

To the Editor: I have a cow that is heavy with calf and she seems to be weak in the back. She has been down for about a week. At first I could help her up, but for the last two days she hasn't been up at all. She has a good appetite and seems to be hungry all the time. I have been feeding her oat hay and rolled barley, with alfalfa meal mash at noon. Can you tell me what to do for her?

Give fluid extract nux vomica in one-dram doses four times a day. This may tide her over till she has the calf, when she will probably get up.

DOG WITH WORMS.

To the Editor: I have a very promising young dog, Airdale and Collie. He acts like an old dog—all crippled and stove up; hasn't shed his hair, sleeps most of the time, has a hard swelling in heel, the front leg swelling the same; passes small, flat-headed, white worm; has always drunk fresh milk, but refuses it now; doesn't eat much.—J. B. R., Kingsburg.

Give this dog one dram powdered areca nut mixed up in a little butter on an empty stomach. Follow this six hours later with a good dose of castor oil.

EXAMINATION OF HORSE NECES-SARY.

To the Editor: I have a mare that has a tendency to keep her hind legs spread apart when standing and when backing she lifts left hind leg high and swings it out. She is very flat-footed and inclined to drag left foot. She was in this condition when I got her. Can you suggest a remedy?—W. H. H., Caruthers.

The condition appears to be of such old standing that treatment will be useless. In any case an examination would be necessary to make a diagnosis.

BLEEDS AFTER COVER.

To the Editor: I have a mare that was bred about five or six weeks ago, and at the time I noticed she bled considerably after the cover, but the blood soon stopped, and lately a greenish matter has been coming out of the vagina. She eats good and is in good flesh and is healthy in every other way.—E. W. C.

Douche this mare with a one-half of one per cent solution Chlorazene (Abbott) twice a day until the discharge stops.

RABBIT HAD FITS.

To the Editor: What is the matter with my Flemish Giant doe. A week ago she had a fit, knocking her nest over, and could not stand. Now when I feed her she will struggle around the box until she gets to a corner, and there is able to prop herself up and can manage to walk along the side of her hutch. Her head stays twisted to one side. I feed her oat hay, barley, and some green grass.—C. P., Martinez.

This looks like ear mange. Wash the ears with lime-sulphur solution daily.

RADIAL PARALYSIS OF HORSE.

To the Editor: From no apparent cause a 10-month-old colt lost the use of its left front leg. There was no sign of bruise or external injury of any kind, neither was the skin broken. There was no flinching from any pressure that was applied. It came on suddenly about four weeks ago. I have been applying liniment and the colt is just beginning to let the affected limb support a little

weight again. What can I do?—M. E. H., Woodland.

This is a case of radial paralysis. Time will effect a cure in this colt assisted by the application of ammoniated liniment of camphor to the region of the shoulder once a day.

MILK DISEASE OF SHEEP.

To the Editor: We lose a number of ewes each year from an affliction our local veterinarian does not seem able to cope with. The animals act dizzy, their heads are thrown high and occasionally they become blind. This condition exists during the lambing season and not at other times. We have tried short rations and different feeds without results. Can you suggest a remedy?—Subscriber, Yolo county.

This trouble is milk disease or eclampsia of sheep. The form which you have can be treated very nicely by the hypodermic injection of morphine or by giving enemas of chloral hydrate. This must be done however by a veterinarian. At times the disease simulates milk fever of cows and can be treated in the same manner.

BOAR WITH SWOLLEN SHEATH.

To the Editor: I have a young Poland China boar, shipped from Iowa about a month ago. Shortly after he arrived I noticed that his sheath was swollen and on examination found that the urine was collecting there. What can I do to stop this?—A. F. B., Potter Valley.

This is a common ailment of boars and does no harm unless the sheath becomes distended. Inject a little 5 per cent solution of tannic acid into the sheath twice a day.

HERCULES HORSE COLLARS

three words of comfort to the horse that pulls. Those three words stand for the proper materials, scientific design, skillful workmanship, and fidelity to the horse.

If a horse could express his preference, he'd ask for a Hercules Collar.

When a dealer offers you a Hercules Harness, Horse Collar or Saddle, he is offering you **THE BEST THERE IS.**

The Cheapest and Best Horse Power Known to Mankind

THE ONLY POWER which guarantees a man from 12 to 20 years' service. The only power capable of anywhere from 500 to 5000 pounds displacement under ordinary road conditions, per horse power. The only power that reproduces itself while it serves you. Government reports show that it pays you from 3% to 5% interest on the feed it eats by fertilizing your farm.

WHY NOT RAISE HORSES AND MULES NOW?

There has never been the shortage throughout the country there is today. There is no possibility of replacing the exportation of horses and mules within the next ten years to come. Few, if any legitimate businesses, can possibly show the profits to be secured from the raising of horses and mules within the next ten years.

I have at my barn in Stockton the best lot of jacks I have ever imported from Missouri and Kentucky to California. Also, PERCHERON STALLIONS, up to 2300 pounds in weight. Also, the Best Saddle Horses, which can be procured throughout Missouri and Kentucky.

And now is the time to buy. One year from today sires of both horses and mules will advance 33 1/3 per cent, and they will continue to advance until they have practically doubled themselves in price. Also, money to be made raising jacks. Dill Brothers, of Clements, California, four years ago bought of me \$12,600 worth of jennets. This year, their first year's offspring of jack colts have reached a salable age of three years, for which I paid them \$10,000 cash, or \$2,000 per head. They will have for sale next year fourteen head of jack colts, worth easily \$20,000, and should equal this the following years to come, which shows a profit of over 150 per cent per year. Can you beat it?

Why not do likewise? Why not follow their lead? As the above only lists their jack colts, they still have their jennet colts for sale in addition to the above as additional profits.

Call and see my stock at the Race Track, while in Stockton. Prices reasonable, and terms payments, if desired.

Talk it over with your neighbors, organize a little company among yourselves, and come in and buy.

H. B. THORNBERRY, FAIR GROUNDS, STOCKTON, CALIFORNIA

Poultry Breeders' Directory.

EXTRA QUALITY White Leghorn chicks, 12c until March 1st, then 10c. Carefully line bred from MacFarlane Young, Martin, and Cyphers strains of foundation stock. Eggs, \$1.50 per 15, \$2.50 per 30, \$5.00 per 100, \$50.00 per 1000. Acres of free range connected with our breeding pens, 20,000 feet under roof. Only Jubilee incubators used; disinfected every hatch. Don't save 2c per chick in buying, and lose a dollar per pullet in raising; get the Best and Success. Newton Poultry Farm, Dept. 1, Los Gatos, Cal. Catalogue free.

ROOFEDEN RANCH CHICKS—Are good chicks, well hatched from first-class utility breeding stock—money-making egg producers. The prices are right—7c to 11c, depending on breed, month, quantity (dozen to thousands). White, Buff, Brown Leghorns; Black Minorcas, Rhode Island Reds, Barred Rocks for dollars and sense. Send card for circular. Roofeden Poultry Ranch and Hatchery, Campbell Cal.

THE J. K. BIGELOW POULTRY RANCH and Hatchery—300 acres devoted to superb vigorous Hogenized White Leghorns. Bigelow chick are incomparably superior to the product of ordinary commercial hatcheries. Prices same as former seasons—10 cents each till April 1, 9 cents during April and May, and 8 cents thereafter. 10% deposit required with order. The Bigelow Poultry Ranch, Sonoma, Cal.

WHITE PLYMOUTH ROCKS—Baby Chicks, hatching eggs, from heavy-laying strain of Hogenized layers. The following winnings at the California State Poultry Show, Dec. 10, 1916, show the quality of my stock: 1st for best egg-type pen; 1st for best exhibition pen, special for best egg-type individual; 2nd and 3rd exhibition pullets and 3rd exhibition cockerel. Mrs. J. B. Tupper, Route A, Ceres, Cal.

BARRED PLYMOUTH ROCKS—COCKERELS—Cockerels—Cockerels—Yes, we have them; also Hens and Pullets—all bred from our Champion Winners at California's leading shows. Also hatching eggs. If it's Barred Rocks you want, get in touch with me right away. Have bred them exclusively for nineteen years. Send for Catalog. Chas. H. Voden, Box 306, Los Gatos, Calif.

"FINEST HATCHERY IN THE WORLD"—Baby Chicks, White Leghorns, and Rhode Island Reds, settings, 100's, 1000's, hatched right in our \$60,000 brick and concrete hatchery from our quality heavy layers. Reasonable prices. Stock, Hatching Eggs. Pebbleside Poultry Farm and Hatchery, Sunnyvale California.

WHITE PLYMOUTH ROCK, White Leghorn Incubator Chicks, Breeding stock, Eggs high class. Scientifically bred. Awarded all first prizes, California State Fair 1916. Make your arrangements for 1917 delivery of chicks. Mahajo Farm, P. O. Box 597, Sacramento, Cal.

HATCHING EGGS—We will sell a limited number of eggs at \$2.00 per setting of 15, from our pen of Hogenized S. C. White Leghorn hens, 4 and 5-finger measurement, mated with magnificent cockerels, 235-egg type. Atterbury Poultry Farms, Rt. 1, Box 183, Turlock, Cal.

BABY CHICKS—From large, healthy, vigorous, heavy laying thoroughbred Single-Comb White Leghorn—\$10 per 100; \$2 per 100 when order is booked, and balance 5 days before delivery. I pay the express to your nearest express office. H. A. Schlotthauer, Exeter, Cal.

BABY CHICKS—Get some of our good strong youngsters but order as far ahead as possible. Hatches every week. R. I. Reds, Barred Rocks, Black Minorcas, White and Brown Leghorns. Write for circular. Campbell Poultry Ranch, Campbell, Cal.

WHITE LEGHORN AND BROWN LEGHORN day-old chicks from healthy, vigorous breeders. "Chicks well hatched are half-raised." Will be pleased to send you our circular. San Jose Hatchery, 373 Meridian Road, San Jose, Cal.

THOROUGHBRED WHITE LEGHORN and Rhode Island Red Chicks. Delivery up to June first. Our stock are strong and vigorous, are practically non-setters, and heavy winter egg producers. Brooke Farm, Rancho Del Paso, Office 807 J St., Sacramento.

FOR SALE—WHITE ORPINGTONS—One dozen pullets and a few cockerels. Direct from Aldrich Poultry Farm, Columbus, Ohio. Bred from Quality King, best prize-winner in America. 1024 Ramona St., Palo Alto, Cal.

BABY CHICKS—We hatch from our own stock of 10,000 vigorous, healthy S. C. White Leghorn hens of heavy laying strain. Write for price list and further particulars. George Brothers, Petaluma, California.

TUPMAN POULTRY FARM—Panama Pacific Winners. Place your order now for chicks, eggs and breeding stock from our heavy-laying, prize-winning, utility S. C. White Leghorns. Phone OX2 Ceres, Cal.

CHOICE Rhode Island White Cockerels for sale at \$3. A few trios at \$7.50. Eggs for hatching in season at \$2.50 and \$3.50 per setting. A. W. Mumm, Route 3, Sacramento, Cal.

"BRED-TO-LAY" White Leghorn Hatching Eggs—Hogenized utility birds. None finer. Order now for February and March. Pine Tree Poultry Farm, Los Gatos, Cal.

HICKS JUBILEE HATCHERY, Petaluma, Cal.—White Leghorn and Black Minorca chicks and hatching eggs. Circular "How to Raise and Feed Chicks" Free.

S. C. RHODE ISLAND REDS—220-egg record in 12 months. Hatching eggs, Chicks, Stock. Also Rose Comb Reds. Wm. Larm, 3915 39th Ave., Fruitvale, Cal.

Raising Poultry for Profit

QUESTIONS AND ANSWERS.

Don't Feather Well.—I have some chicks, two months old, that are not feathering good, heads are bare and but a few feathers on wings and they do not seem to be doing well.—F. L. B.

Your information is too meager. You should have told me what you fed and how you brooded, but the most likely thing is that the fault is in the brooding. They are too crowded and hot if in brooder, and if with a hen the same will apply. Some hens are very hot, and if the chicks are not in a warm room they crowd under the mother more than is good for them and it kills the feathers. Time and good feed will remedy the trouble, but they require care or they soon take cold when they are bare.

Clabbered Milk.—What amount of clabbered milk, without the whey, can be fed to one hundred hens in breeding pen so eggs will be good for hatching?—Subscriber.

This is a question which can only be answered by reasoning the thing out, for very few people, if any, have ever experimented with it. However, if the hens are not fed any other animal food or dry mash, or, in fact, mill feed of any kind, but simply grain and clabbered milk, I would not be afraid to feed them all they could or would eat once a day, and that at noon. Feed grain in litter morning and night, and the milk—clean, of course—at noon. The exercise of getting the grain out

of the litter will counteract the full feed of easy getting at noon. These hens ought to lay well without being unduly stimulated, and chicks would be stronger if the breakfast were made from sprouted oats scattered in the litter, but I would not feed anything green in connection with the milk.

Flax and Buckwheat as Feeds.—Will flax and buckwheat make good chicken feed? Will it make them lay? I have 200 R. I. Reds ten months old that have not laid an egg. What can be the cause? They are well fed, have clean, warm sleeping place.—P. M. B.

If you mean to feed flax and buckwheat green it might do, but flax as a grain can be fed only in very small quantities. It is too laxative to feed in quantity, but in a ratio of 2 pounds to 100 of other grains it is good. Buckwheat would be all right as a mixture in winter, but too heating in summer. But why bother about such feeds that are out of the usual when we have so many more that are better known and more suitable for our climate? Oats, barley, Gyp corn, rye, buckwheat, in proportion, all make good feeds that will take the place of wheat; but go slow on flax. Your Reds are lacking something in the feed, or I am sure they would lay. I see lots of them lay at five months of age. Better look into the matter; you may think you feed well, but if those pullets don't lay at ten months old, your ideas on "feeding well" are not right, or you don't give enough. The pullets are short either on quality or quantity, and perhaps both.

Droopy Turkeys.—Kindly tell me what to do for turkey hens that become droopy, heads slightly darkened, somewhat stiffened, and no appetite. They drink well and droppings are a waterish yellow. Have given a tablespoonful olive oil for four mornings; also immersed their heads in kerosene. Have kept them in a good dry coop since affected with this ailment.—Mrs. E. B., Potter Valley.

Your turkeys have a touch of liver trouble. Perhaps you have been feeding too much grain. You did not state how you fed them. The best thing now is to give them them one of "Carter's Little Liver Pills" every day for three days. Get ten cents' worth of iodide of potassium and put three grains to a quart of water and let the turks have no other drink. Dipping the heads is of no use; the trouble is internal, not external. Give a little parched wheat and cracked corn, but don't overfeed. Keep them dry and moderately warm until they recover. A little sulphur made into a pill with flour and water will help if you have no liver pills handy. Parch the wheat and corn to just light brown and let cool before feeding.

The flush season for Eastern poultry on the San Francisco market is from months of August to February, during which time there is usually an over supply.

During the past year there were no Eastern eggs shipped into California. The first time this has occurred during the past 70 years.

MAMMOTH BRONZE TURKEYS and Eggs. Booking egg orders now for early Spring delivery. M. M. Zelman, Planada, Cal.

CALIFORNIA TABLE POULTRY AND BROWN EGGS.

(Continued from first page.)

the same price for the brown egg as the white egg is now being considered by dealers of the San Francisco market, providing, of course, that the brown egg is graded, sorted, etc., the same as is now done with the white egg. The poultry industry for this State is growing with great strides, and Mr. Coleman states that their plant at Benicia alone will be capable of handling 1,000,000 head of poultry per year.

Economy in Modern Methods.—Mr. McCullough, of the McCullough Provision Co., states that the best modern method of handling poultry is the establishing of buying houses in the larger poultry centers. The poultry is taken to these buying houses, where it is killed, chilled, graded and packed and shipped to the central station for distribution. This method enables the buyer to pay the rancher more and by saving shrinkage, commission, expressage on coops, etc., puts a superior chicken on the market at a lower cost to the consumer. He states that under former marketing methods the shrinkage of live poultry from ranch

OLIVE TREES—Mission, Manzanillo, Ascolano. Propagated by me from trees of known bearing qualities. Guaranteed. L. T. Schwabacher, Hemet, Cal.

MISSION OLIVE TREES—Raised from my own bearing trees. This is the only sure way to get what one wants. W. A. Hayne, Box 461, Marysville.

FRANQUETTE WALNUT TREES—Grafted on Black Roots. Vigorous stock at lowest prices. Ogden Bolton, Jr., Route 6, Santa Rosa, Cal.

FOR SALE—Gold Dollar and New Oregon Strawberry plants, \$3 per M. D. R. Bannister, P. O. Box 185, Oakdale, Cal.

WANTED—Machinery and equipment for cannery—new or second-hand. R. G. Root, Rte. 3, Sacramento, Cal.

COUNTRY LANDS.

BIGGER CROPS and pleasanter climate are the advantages enjoyed by farmers in Eastern Washington, Northern Idaho and Western Montana. This "Inland Empire" is noted for sure crops by ordinary farming methods—without the extreme heat or cold that injures crops and takes a lot of joy out of life. Conditions are favorable for general farming, dairying, live stock, poultry and truck farming. Write for our folder, "A Farm Home For You," and tell us what kind of a place you want. Farm lands in the Northwest are bound to increase in value. Farm Development Bureau 19, Chamber of Commerce, Spokane, Washington.

HUMBOLDT STOCK RANCHES—\$10.00: Safe Sheep Range of 5000 acres on State Highway. Neighborhood controlling coyotes; three pack hounds. \$10.00: 5700 acres Cattle Ranch near Railroad. Joins Forest Reserve. 500 acres tillable. Good soil. \$4000.00: Half cash. Worth it. Will Perry Ranch with tools, Alderpoint. Se owner. Bad health. Just returned to S. F. Sold Curless Ranch, Stockton. C. E. Robertson, 105 Montgomery St., S. F.

FOR SALE—948-acre stock ranch in Napa county. Price, \$17,000 net. All modern improvements. Living creek. 125 acres hay, grain and alfalfa land. Free range adjoining. 175 head of cattle can be purchased if desired. Liberal terms. Owner, Box 363, Napa, Cal.

FOR SALE—20 acres good alfalfa or fruit land. Splendid location, 2 miles from Modesto. Fair improvements, leveled, checked. Only \$5500. \$3000 can remain 5 years. J. H. Wilder, owner, Rt. 1, Box 129, Modesto, Cal.

FREE NEW BLUE BOOKLET—State, Government and Indian Lands. Bargains overlooked. Joseph Clark, Sacramento.

to the time it eventually reaches the retailer is about 15 pounds to the 100. California imports about 300 carloads of live large breed chickens each year for table purpose, and that there is no reason why these larger breed chickens cannot be raised in this State and marketed to the advantage of the raiser when it is taken into consideration that the expense to the Eastern shipper, for freight, shrinkage, feed, etc., in shipping to this market is 5c per pound. The buying house or branch of the McCullough Provision Co. at Petaluma handled 187,461 head of poultry in 1915, and 275,868 head during 1916.

INCUBATION POINTERS.

[Written for Pacific Rural Press.]

"The trouble with many beginners is that they don't air their eggs enough," says C. H. Hosford of Riverside county, whose 15 incubators have a capacity over 6,000 per hatch. He keeps most of the incubators in a basement whose walls rise high enough above ground to supply light and air. Being in the basement, which is not wet, avoids sudden changes of temperature.

It is well not to cool the eggs too much at the start; but toward the end of the hatch, they need cooling an hour or so per day, depending on the weather, but never in a draft. More trouble comes from keeping the eggs too consistently warm than from too much cooling. Mr. Hosford left an incubator door open all night once and that proved the best hatch of the lot.

All eggs in an incubator should have been laid about the same time; for fresh eggs hatch sooner than older ones. The incubator cannot safely be opened to ordinary outside temperatures while chicks are hatching. Thus the first-hatched chicks from the fresh eggs use up the oxygen and the later ones are severely handicapped.

Incubators should have a way of ventilation and introducing moisture. If the air is too dry, pipped chicks dry out and stick to the shell. There is usually plenty of moisture when the first eggs hatch, but later ones may suffer if the hatch is very uneven.

If a chick is not strong enough to get itself out of the egg, it isn't worth bothering with and is given away by Mr. Hosford. A few of such sold as good chickens might easily ruin a reputation which has taken years and much expense to build up.

RICE AS POULTRY FOOD.

[Written for Pacific Rural Press by Geo. H. Croley.]

Rice as a food for poultry and other livestock is a very valuable ingredient, providing it is not used in excessive quantities. Rice is a very one-sided ration, composed principally of starches and heating material, and is also lacking in a number of mineral elements that are necessary for a complete food.

Rice bran is also valuable as a food for poultry when fed in moderate quantities with a variety of other foodstuff. However, it should be genuine rice bran and not a mixture containing part of the hull. The hull in which the grains of rice

HOPLAND STOCK FARM, POULTRY DEPT..

White Leghorn and White Plymouth Rock Cockerels. White Leghorns and White Rock Baby Chicks hatched from specially selected heavy-laying stock. Prices same as last season. White Leghorns, January and February delivery, \$12.50 per hundred; March, \$10.50; after April, \$10.00. White Plymouth Rocks, \$15.00 per hundred. All F. O. B. Hopland.

San Francisco Office,

1210 Flood Bldg.

grow are woody and tough and usually they carry considerable silica or small sharp sand. The hulls when ground have very rough edges and sharp points that carry small barbs that cut and tear the intestines.

The Louisiana Experimental Station tried numerous experiments and reported many cases of vomiting and death with animals that were fed rice hulls. As a result of these experiments the Station decided that rice hulls in any form were worse than worthless. Unhulled rice, or paddy, may be fed to poultry to good advantage, providing this article does not exceed 10 per cent of the grain ration. When fed in this manner the hull does not seem to cause serious injury as is the case when it is ground.

POULTRY NOTES.

Fallbrook will soon have a collection branch of The California Poultrymen's Ass'n.

The large breeds of fowls shipped from local points at present time command the same price as Eastern stock of the same type.

Poultry raisers should study market conditions, shipping when best prices are obtainable and not wait to ship until such time as it suits their convenience.

Sell young roosters before they get coarse, staggy and develop spurs, otherwise there is usually a difference of 4 to 6c per lb. in price between a smooth young rooster and one that has developed hard spurs.

The Pomona Valley Poultry Breeders' Association at its annual meeting, recently held, at Pomona elected the following officers for the ensuing year: Henry W. Boon, president; R. A. Condee, first vice-president; C. H. Taylor, second vice-president; Dr. E. W. Harris, secretary, and Carl Tribing, treasurer.

The American Black Minorca Club held its annual meeting during

THE SPRING STYLES.

My dear Friends: Practically all the stores are showing spring millinery and so far there seems to be only two popular styles. One is the sailor with rather a large, high crown and either plain or rolling brim and the other is a high stiff-crowned hat with almost no brim at all. The sailor is shown either in all straw or with a facing of silk or sometimes with a facing of straw and the whole upper part of the hat covered with either silk or crepe. For general wear, the colors are dark, either blue, black or brown, but for sport wear the very same shape is developed in bright colors. The small hats are in all colors, but not as much straw is seen except in the dark shades. The brighter hats are mostly made of silk, satin or ribbon. The ribbon hats are so easy to make that any clever woman could make one at home, if she had a shape and a couple of bolts of narrow satin or picot-edged ribbon. If white is going to be popular this spring, it has been slow being shown, only a few in combinations of braid and satin are in the show windows.

Soutache braid continues to be used as a hat trimming and also on some very pretty dresses. One wonderfully attractive dress was a simple model of white crepe and serge and the serge was heavily braided with soutache. Still another was of mustard colored crepe made in a middy style with the braiding of the same color around the neck, on the cuffs and around the bottom of the middy blouse.

Khaki-kool is the name of one of the most popular silk fabrics of the spring—it is a rough silk and comes in both plain colors and fancy stripes and designs. It is used in combinations very largely and makes very stunning looking sport costumes. In the more subdued patterns it would be good for wear with sweaters. Some of the newest sweaters are in plaids—one a beautiful combination of green, gold and black, with gold sash, and another one in gold and dark grey with a sash of dark gray with gold border, and the sash worn tied in the back.

Blouses continue about the same in material and style. The crepe de chine are still tailored, plain sleeve with a cuff and many of them with the convertible collar. The Georgette crepes are a little more dressy and some of them have large collars and wide revers trimmed in lace.

One of the new fabrics is called Forestry cloth—it is a smooth-finish material in an olive green coloring and is specially recommended for tramping or general outing wear.

So far this spring there are very few radical changes in the styles—the long lines and pleated effects with loose belts seem to be just as good style for dresses as they were last winter.

The peplum blouse is very pretty for slight figures and it makes a very pretty summer dress when blouse and skirt are of the same material.

Rosabella Best.

For Unboiled Icing.—A little melted butter added to unboiled icing will prevent its forming a crust and cracking.

THE HOME CIRCLE

HOME-GROUND WHEAT BREAD.

From the inquiries that have reached this office, much interest was aroused in the article on home-ground wheat that appeared in the issue of July 27. In response to these readers, the following recipes on the use of home-ground wheat in bread-making are given.

The following recipe was worked out in the Office of Home Economics, U. S. Dept. of Agriculture: 3 cupfuls of wheat meal, or 2 cupfuls of wheat meal and 1 cupful of white flour; 1½ cupfuls of lukewarm water, ½ cake of compressed yeast, 1 level teaspoonful of salt, 1 level tablespoonful of sugar and 1 level tablespoonful of shortening if desired. Mix the yeast with a small amount of lukewarm water; dissolve the sugar and salt in the rest of the water; mix the two solutions and add all to the meal (or meal and flour). Mix thoroughly so that all the liquid is incorporated in the mass, cover and set in a moderately warm place to rise. After about 2 hours or when well risen, add the shortening and knead well, adding a little meal if necessary, until a smooth, elastic dough has been formed. Cover and set aside again to rise for about 1 hour. Knead lightly, form into a loaf, place in a greased pan and allow to rise until just double in bulk. This is only two-thirds of the usual rise in the pan when white bread is made. Bake slowly for ¾ of an hour.

Another recipe which is a little more economical and higher in food value, on account of the use of milk, follows: 1½ cups skim milk, 3 cups home-ground wheat, 1 tablespoon sugar, ¼ teaspoons salt, ½ dry yeast cake and 1 tablespoon butter or other fat.

Put the sugar and salt into a mixing bowl, scald the milk thoroughly and pour over the sugar and salt. Dissolve the yeast in a little of the liquid, add it to the rest of the liquid and beat in 1½ cups of meal. Cover and keep about 70 degrees over night or until the sponge is very light. Add enough more meal, about 1½ cups, to make a loaf stiff enough to mold without sticking either to the hands or the board. Mold in the fat now. Allow the dough to double in volume, mold into a loaf, put into a pan and allow it to rise until it meets the top of the pan. Bake 50 to 60 minutes.

To prepare the wheat for use as meal, it must be washed until the water is clear and then spread out on a cloth to dry thoroughly before it is ground. An ordinary coffee grinder will answer for the grinding.

A GARDEN CONTEST.

Every school district should have a garden contest for its children. This contest could be for a score of 400 points: (1) 200 on efficiency; (2) 100 on quality and (3) 100 on variety or the greatest number of kinds of vegetables. Efficiency in the use of space may be obtained by a succession of crops or by utilizing the ground for two crops at once. Quality should include not only the quality of the vegetable, but the condition and general appearance of the garden.

To make a success of the movement, there must be wide awake leaders to distribute directions and give advice, and interested men of the community to furnish the prize money. If the contest is under the supervision of the teacher, the ground for the gardens should be near the school. Otherwise it is just as well to be at each child's home. The judge of the gardens should be some one of standing whose verdict will be accepted without question.

STANDARDIZED DRESS.

The women of the Resartus Club of Stanford have adopted a style for official dress that it is hoped will be generally accepted for college wear. The skirt is to be four-gored, opened in front, with a bias seam in back, comfortably short and reasonably full and the blouse is to be belted, open at the throat with turn over collar. Collar and cuffs of white material may be worn. At one Middle West school, this pattern is used for all dresses, varying the material as the occasion requires.

BURNED KETTLES.

If you are unfortunate enough to burn a granite kettle badly, do not scour it with a scouring soap, for you are likely to chip the enamel and thus make the pan unfit for use again. Instead, sprinkle a little lye in it, add water and let boil until clean. This makes the pan almost like new again.

TO SET COLOR.

To keep color from running in colored materials, when washing put 1 tablespoon Epsom salts into 1 gallon of water and even the most delicate will not run or fade. Use in the rinsing water as well.

LIVING WITH OTHERS.

It costs to live with people. We have to give up many of our own preferences to please them. We have to deny ourselves many enjoyments, so as not to give them pain.

ENGLISH BEEFSTEAK PIE.

Rub a baking dish with onion, butter it well, sprinkle with chopped parsley. Cut steak (upper round) into thin pieces, 3 or 4 inches long. Season with salt and pepper. Cut thin slices of bacon, same size, and roll up in the steak. Pack the dish with these little rolls; pour over this 2 cups rich soup stock or gravy, well seasoned. Now add ½ teaspoon Worcestershire sauce with 1 or 2 hard-boiled eggs sliced. Sprinkle fine chopped parsley over all. Cover with crust with openings to let steam escape; bake until crust is done. For the crust, use 1 cup flour, one-third cup lard, one-third cup water, and one-half teaspoon salt.

Floral Department.

[By Geo. N. Tyler.]

MOLES—SEED SOWING.

I have had a query this week in regards to moles. I am greatly troubled with them myself, so here is an article from the Florist's Review, which looks good, and I will certainly try it:

I read the letter of F. W. & Co. in the Review stating that they are troubled with moles in their sweet pea beds. Some years ago I was annoyed by moles just as F. W. & Co. are and I tried almost every known remedy, but without avail. Then one of my employees, an old man from Holland, told me that if I would procure some salt fish he would rid the place of the moles. Surely enough in less than two weeks not a trace of the pests could be seen. He dug holes in the runs, dropped into them pieces of the fish about the size of a walnut and then closed the holes. He told me to repeat the dose if any of the moles returned. I spread the good news to my neighbors and they also have freed their places of moles by following the same method. The old man explained the operation of the remedy by stating that the moles love fish and the salt kills them. Whether that is the right theory or not, the plan worked well for me and may do so for others.—W. M. Coleman.

You can now sow seeds of the tender annuals. Marguerite carnations should be sown now. Get a good strain of seed (they bloom in four months from seed) and at least seventy per cent of them will come double.

Sow cosmos now as described in my last article, also ten weeks stock, calliopsis and coreopsis, corn flower, larkspur, gaillardias, lobelia, feverfew, salpiglossis, cannas; maurandia vine for hanging baskets, and as a climber for the greenhouse.

In sowing fine seeds such as petunias, begonias, etc., take a seed pan, put in ample drainage, and about two inches of finely prepared soil. Water with boiling water, and after the soil has cooled sow the seed evenly on top of the soil and cover with a glass or piece of paper. Keep warm and shaded until they germinate, then give more light and air.

Sow asters as follows: I grow Vick's late branching for cut flowers and my own use. Prepare your flats as described in last article. Firm the soil down and water in an hour or two; sow the seed on top of the soil and cover with one-fourth inch of fine sand. They must be in a warm place and protected from frost. A cold frame or green house is just the place. In watering seeds or seedlings do so in the morning with lukewarm water, for if you water them at night, the damp surface is liable to produce a fungus, which will cause most every plant to damp off during the night. This especially applies to all fine seed plants, and also to asters, etc.

RAISIN AND RHUBARB PIE.

If you have never eaten raisin and rhubarb pie, you have missed one of the most delicious of pies. Here is the receipt for it: 2 cups seeded raisins, chopped; 2 cups rhubarb, cut in ½-inch pieces; 1½ cups sugar. Stir together and add one egg well beaten. Line a pie tin with crust, add the mixture and place bits of butter on before adding the top crust. This quantity will make 2 pies.—Contributed by Mrs. W. L. M., Visalia.

POOR SPELL.

I cannot spell—I wish I could. The dictionary is no good. To aid a boy in spelling write, And mother is too busy quight, She never can take time to seigh. Whether a horse should 'ney' or 'nay.'

Whether a pen: "The pretty flour Came up and withered in an ow'r," Or not, and anyhow I trigh. It's not correct or even ny, I'd like to be a savage, thain I'd never need to spell agen!

—Selected.

UNDER THE MESQUITE.

Nan and Don Rogers crawled in under the mesquite bushes to get away from the hot sun.

They longed for the green grass and the cool shade of the tall maples they had always played under in the North. But away down here in New Mexico there were no trees, just scrubby bushes and burning sand that stung their bare feet when they ran about in it.

Nan and Don had been playing tag among the Spanish daggers. The Spanish daggers are tall plants with long, narrow, sharp, tough leaves that are like daggers.

The children were very hot and tired. So they were glad to lie under the mesquite and rest, even

though the shade was "patchy."

Small Don liked to watch the queer little animals, especially the lizards that seemed all tails, and the funny horned toads, darting about here and there in the sand. But Nan was afraid.

Whenever one came near her she just drew her feet up under her and screamed.

This delighted Don, who thought it very silly and very cowardly of Nan to be so frightened. So he laughed at her and teased her about it.

Pretty soon, however, something happened. Just as active Don was beginning to tire of watching the little creatures, and Nan was ready to cry, a rabbit, a cotton-tail, came up and peered through the bushes at them.

Both children kept very still so as not to frighten it. It came so close than Nan almost could touch it. Then suddenly it turned and bounded off, its short white tail looking for all the world like a little bunch of cotton sticking to it. That is why they are called cotton-tails.

As the children watched it, breathlessly, hopping in and out among the bushes, all at once Don gave a great scream—oh, a much greater scream than any Nan had given!

"What is it, Don?" Nan cried anxiously as she saw him grasp a chubby foot.

But Don only screamed louder and louder.

Then she saw, and her little face grew white. A centipede had fastened itself to Don's bare ankle.

Now Nan was more afraid of a centipede, with its many little feet, than of anything else, and usually nothing could have induced her to touch one, and she always ran just as fast as she could to get away from them. But now, in spite of her terror, she reached out her little hand and jerked the thing from Don's ankle instantly. Then she hurried him home to mother.

By the time they reached the house, Don's ankle was all red and swollen, and how it did smart! But mother bathed it, and put some cooling medicine on it, and wrapped it in soft cloth, and said it might have been a great deal worse if Nan hadn't acted so quickly.

The next morning Don's ankle was very much better. But you may be sure he never again called Nan a coward or teased her for being afraid of little wild creatures.—Bessie C. Paine, in Sunday School Times.

Good Health.

[By H. E. Pastor, M. D.]

A Commendable Work.

Canned goods are growing in favor yearly under more careful supervision of the raw material and the observance of more sanitary conditions in the cleaning and preparation of the vegetables and fruit used. Adulteration and other forms of sophistication are happily growing rarer, so that it is now quite possible to buy in the open market wholesome and palatable canned goods at those seasons of the year when there is a dearth of the fresh article, as well as at other times. It is disappointing, therefore, to read in the California State Board of Health re-

port for December (1916) of a flagrant case of disregard of sanitary regulations by a tomato-canning concern in Alameda county. A Health Department official, accompanied by two inspectors, visited this plant late last year, and found there much moldy and rotten stock awaiting processing. It is regrettable in the extreme that any company engaged in the work of preparing food for human consumption should be so criminally callous of the health and lives of its prospective patrons as to deliberately use unfit raw material in the manufacture of its output. On the other hand, it is gratifying to be reassured that, as a result of rigid inspection by the public health authorities, sanitary conditions are observed by canners generally, and that very little unfit food-stock gets by undetected.

The Rural Press is glad to note the persistency of the Bureau of Foods and Drugs of the State Board of Health in ferreting out and prosecuting firms engaged in the manufacture of food products which are given to unsanitary practices and the use of unfit raw material for canning purposes.

Get the Habit of—

1. Early rising.
2. Retiring early.
3. Eating slowly.
4. Seeking the sunshine daily—when there is any.
5. Daily physical exercise.
6. Laughing at misfortunes—your own, not others'.
7. Cleansing your teeth just before retiring—at least.
8. Masticating well every mouthful of food.
9. Gargling the throat with cold salt water after cleansing the teeth.
10. Not coddling yourself when winter comes; too much clothing is not desirable nor hygienic.
11. Having fresh air in the bedroom the year round.
12. Relaxing mind and body when you retire; do not try to hold the bed up.
13. Observing the correct poise and carriage of your body.
14. Exercising before a daily bath and taking a vigorous rub afterward.

This list is not original, though it is almost as good as if it were. We fell upon it in a chance magazine, but did not hurt it, so present it to our readers.

Don't Neglect.

Adenoid growths in children are much more common than is generally supposed, and the bad effects of their presence is underestimated. They frequently interfere with speech and are liable to cause partial deafness. Their effect, too, on the mentality is very decided, causing children of fair average brain power to appear dull and stupid. The presence of adenoids is easily diagnosed, the victim among other things being marked as a "mouth breather." The operation for the removal of adenoids is as simple as the diagnosis, and should under no circumstances be neglected. If you suspect any of your children to be suffering from this troublesome affliction, you had better have an examination made at once.

Strange, but True.

If some form of eugenic law had been enforced in the last generation many enthusiastic eugenicists wouldn't be with us today.

Is cigarette smoking becoming "effeminate"? Then stop it.

A New, Better and More Satisfactory MAIL ORDER SERVICE

For Everyone Out of Town
Who Wants a More Livable,
BETTER Furnished Home!

We maintain a Personal Service Shopping Bureau especially for the benefit of our out-of-town customers. Every order is given the same attention by our expert shoppers who buy FOR YOU, as though they were buying for themselves. They seek the very best values in our stock FOR YOU. They take advantage of the very best BARGAINS. They give your instructions the greatest possible care.

Write for what you want. We send, in many cases, for your inspection, actual photographs of furniture upon our floors, which we believe will best meet your preferences. We quote you prices of the very best values in our stock. We enable you to secure the very newest products of the very best factories, and at lowest possible cost.

We send drapery samples, wall paper samples, etc. Tell us as nearly as you can what you wish and we will make special effort to meet your demands.

We pay the freight 100 miles and part of the freight for greater distances. Careful packing, prompt shipments.

All goods GUARANTEED ABSOLUTELY AS REPRESENTED and SATISFACTION ASSURED. Write us. Address MAIL ORDER DEPT.

San Francisco, Feb. 7, 1917.

WHEAT.

Local trading in wheat has been very light during the past week and only one notable change is to be found in the quotation list. California Club is bringing five cents per cental higher. This advance is the result of one firm's buying to fill a shipping order to South Coast ports.

Sonora wheat\$2.75@2.80
Northern club2.70@2.75
Calif. club, cti.2.65@2.70

Northern RedNone offered

BARLEY.

Sales of barley are held back by the light offerings but the demand is not heavy enough to bring an advanced price. The long dry spell in the country sections has brought ready sale for all feed barley and this offering is bringing as high as \$2.30 per cental. Not enough brewing stock is held here now to warrant quoting.

Seed, cti.\$ 2.50
Shipping, cti.2.35@2.40
BrewingNominal
Choice feed, cti.2.25@2.30

OATS.

The offering of red seed oats from Texas at \$2.75 to \$2.90 per cental has been the feature of the past week's trading in this line. White oats of inferior grade were shunted onto the market by some up-state dealers and the quotation on this grade broke to a top of \$2.25 per cental. Red feed stock is practically cleaned up and the quotation remains nominal at last week's level.

Red feed\$1.85@2.00
White2.15@2.25
Red seed (Texas)2.75@2.90

CORN.

The snow blockade in the East proved effective in holding prices on corn steady during this past week, as only one car has reached here to date. Eastern varieties are particularly hard to get, and this shortage has been reflected in a better call for California stock.

[First-hand prices on strictly first-class grain, San Francisco.]

BEANS.

Prices on several varieties of beans were advanced this past week, but this cannot be of much benefit to the producer, as very little stock is left in first hands. Humboldt growers are still shipping in small lots of Lady Washington and red Kidneys, but seem to feel that it would be advisable to hold their stock in the warehouse here for a time. Limas are being held firm at \$3.25 in the South, but the call has been only average and local offerings at \$3 have proven sufficient to care for the demand. Cranberry, bayo and Mexican red beans have all advanced and trade sentiment seems to favor a further advance on limas and small whites.

HAY.

With the exception of alfalfa hay and baled straw, there was a general advance in hay prices last week. Offerings were of about the same volume as for the preceding week, but the country call was much heavier. The prolonged drouth has been the cause of heavy buying by dairymen and stockmen and many producers who sold hay around \$16 to \$18 per ton are being forced to buy it back at prices far about these figures. City trade continues light. The hope is being expressed that the warm weather which has marked the start of this month will continue, as it will mean at least a partial supply of green feed and will do much to relieve the tenseness of the present situation. It is reported that in a few sections the stock is on the verge of starvation. This has resulted in a call on the hay districts from other interior sections, causing a very apparent shortage for the city trade. Such stock as remains in farmers' hands is being held until rain is received and it is practically impossible to purchase any of the few lots remaining in first hands.

[Price per ton, carload lots, San Francisco.]

POTATOES, ONIONS, ETC.

With the market in the practical control of three wholesale firms, the price on onions is being forced higher every day. Ice house goods is being held at \$10.00 per cental while street sales are commanding \$6.50 to \$8. There is very indication that the market will go still higher. Salinas potatoes are practically out of this market. Deltas are bringing up to \$3.40 per cental with Oregon stock commanding a ten cent premium over this. The offering of Southern celery has had a very marked effect on the price for delta goods, the latter declining to a top of \$3.50 per crate. What few California tomatoes came to hand dragged at unchanged prices, the lots being of generally poor grade.

POULTRY.

The general trend of poultry prices has been upward, the snow blockade having delayed Eastern offerings while California producers show a tendency to ship in lighter quantities. The start of the laying season has halted receipts of hens to a marked degree and quotations on this line are higher. Dressed turkeys have held about steady with live fowl easier under a slower call. Belgian hares have advanced.

BUTTER.

Increased receipts and a very decided drop in the demand, the result of the high prices in effect the first of the week, brought a lower closing on butter quotations. On last Thursday the extra grade of butter was quoted at 43½ cents per pound, a record figure for February during the past five years. This resulted in retail prices of \$1.00@1.05 per two-pound square and the trade in groceries promptly dropped off to such a degree that lower prices were made necessary to move current receipts. The Northwest was a light buyer here. More than 100,000 pounds of butter was shipped to Los Angeles this week. Local conditions point to an easier market, the opening weather for February portending plenty of green feed and more butter.

CHEESE.

The cheese market continues firm, with a good shipping demand figuring in keeping prices up. The East is still a buyer here, with two cars of Flats sent from here and six cars from in-

Special Citrus Market Report.

Los Angeles, Feb. 6.

Shipments of citrus fruit from Southern California from November 1 to February 4: oranges 5,713 cars and lemons 1,319 cars. Same time last year: oranges 4,174 cars and lemons 1,387 cars.

Shipments from Central California from November 1 to Feb. 2: oranges 3,957 cars and lemons 141 cars. Same date last year: oranges 4,138 cars and lemons 119 cars.

There was less life in the markets the past week and they were hardly so firm. The very cold weather interfered with the movement of oranges and lemons and caused buyers to hold back and go slow and this caused a weaker tone to the market. Good highly colored oranges sold in a fair way, but all others were draggy and weak. Lemons held up better than oranges, not so many going forward. Locally the week was another dull one with local packers. The market was overrun with culls, which worked much against the regular market. Packers bought sparingly, but when they did, paid last week's prices, 1c per pound for good highly colored oranges in the grove picked. Grapefruit

is still 2c per pound in the grove picked for best northern. Southern is not ripe enough yet to attract attention. Tangerines slow sale at 1@2c per pound in the grove picked. Lemons were in very good supply and dull and weak. Packers bidding 1@1½c per pound in the grove picked for the best of them. Poor sell for what you can get. But always below 1c per pound in the grove picked. The weather just now is having much to do with the markets East and until it becomes more moderate little improvement need be looked for.

AUCTION SALES.

New York, Feb. 5.—Market steady on oranges, but easier on lemons. California navels averaged \$1.95@2.10. Lemons averaged \$2.00@3.00.

Boston, Feb. 5.—Twelve cars sold, market unchanged on oranges, doing better on lemons. California navels averaged \$1.75@2.50. Lemons averaged \$3.00@3.45.

Philadelphia, Feb. 5.—Two cars sold. Market unchanged on oranges, slightly lower on lemons. California navels averaged \$1.70. Lemons \$2.40@2.65.

Rice Market Confronted with Large Crop.

With 65 per cent of the California rice crop of 1916 still in the growers' hands, pre-emption of export and Eastern markets by an extra large southern crop; lack of water transportation, together with recent decision of Inter-State Commerce Commission raising the freight rate east of Denver, the local market remains in a demoralized condition.

Statistically the situation is not favorable to higher prices, which are figured on a basis of \$1.70 per cwt. for No. 1 paddy f. o. b. San Francisco. Normally the consumption of clean rice in the U. S. is 6,500,000 pockets of 100 pounds each. During 1915 the production of the country was 7,000,000 pockets leaving a carry-over of 500,000. This with the 1916 crop of 9,500,000 pockets makes a surplus of approximately 3,500,000 pockets.

The 1916 California crop is still further handicapped by lack of quality, millers estimating that two weeks longer in the field would have improved it fully 20 per cent. Local consumption is being increased somewhat by stockmen and poultrymen, and the high cost of living is evidently aiding in the disposition of the Southern crop. An increased trade in brewer's rice, rice flour, breakfast foods, etc., is also proving a factor in distribution. Southern rice is being crowded out of Coast markets to the extent of 30 per cent.

Millers declare that present prices may be lowered later as much of the immature rice held will not keep, necessitating immediate dumping of large quantities on this market. Lack of proper organization in 1916 is given as the chief cause for the present situation.

J. W. E. Barnard submits the following estimates of 1917 acreage: Gridley, Biggs, Richdale, will reduce last year's areas about 60 per cent; slight increase in Marysville district; Chico and Butte City will increase about 40 per cent; Willows about same acreage; Yolo county about 25 per cent increase and the San Joaquin Valley will plant about 7,500 acres.

terior points during the past week. The Eastern demand for cheese is so good that one dealer has taken a car of Eastern goods from the ice house and sent it back to its original shipping point, paying freight two ways and storage charges here and still realizing a profit on his first cost.

DECIDUOUS FRUITS.

Storage withdrawals of apples continue at a heavy rate, the last weeks total being 16,000 boxes in excess of that for the preceding corresponding period. Storage holdings in local warehouses at the start of this week were 216,000 boxes, about 75 per cent of the total on hand a year ago at this time.

Apples:

Pears, Winter Nellis2.50@3.00

DRIED FRUITS.

Trade in dried fruits is generally held up by the war developments and most of the packers are said to have called in their men for the time being. This is especially true of deals which had been pending with Eastern interests. The spot trade, which is of little interest to the farmers because of the light holdings in first hands, has shown no developments of note. Apricots, spot prunes and pears are somewhat higher with very little stock of either apricots or pears on hand. In bids on futures, local houses are not showing any inclination to advance. However, their evident desire to close contracts indicates that a generally firm market is expected. Figs are still the center of interest with more attention being paid to prunes. Offers on 4-size prunes, 1917 crop, are now 5@5½ cents per pound and general indications point to a further advance. Exports of dried fruits during January was nearly twenty per cent greater than during January, 1916.

HIDES.

Hide prices met no important changes during the week, with buyers holding off. Uncertainty rules in the Eastern markets and local dealers are afraid to make any decided steps at the present time.

HOPS.

Quotations on hops were unchanged during the past week. While some contracting for next year has been reported in Oregon and Washington, the local buyers seem satisfied to wait a short while before starting the campaign in earnest.

GROCERIES.

Flour prices still hold steady in the local market but declines in Oregon and Washington indicate that easier prices may be expected here. The decision of the Interstate Commerce Commission lowering freight rates between here and Utah should be a further factor in this, as the Utah millers can now lay stock down here cheaper.

LOS ANGELES.

Los Angeles, Feb. 6, 1917.

BUTTER.

Receipts of week ending Feb. 6, 1917208,713
Receipts of week ending Feb. 6, 1916347,010

The market closed the past week sharply lower than the week before. While the receipts were somewhat better than last week, yet in the absence of cold storage stocks, were all needed for the consuming trade, which was good. Hence the first part of our review week there was a sharp advance under light offerings, the improvement up to Friday reaching 3½c. This caused a better movement to market and since then prices have worked lower, closing 4c off compared with a week ago. In Chicago extras closed the week 1½c higher and in New York 3c higher than a week ago. This failed, however, to check the late break here in the face of expected better receipts.

We quote extra creamery38c

EGGS.

Receipts (railroads) for week ending Feb. 6, 1917—1457 cases. Receipts (railroads) for week ending Feb. 6, 1916—1933 cases.

A rather firm and steady market was had the past week. Receipts were only fair and lighter than the same week last year. Cold storage stocks have been exhausted which also had a bul-

Optimistic Feeling Among Egg Dealers.

Although the present egg market is admittedly a speculative one, dealers confidently expect prices to remain steady to firm for the immediate future at least. Lowering of the recent high prices has allowed speculators to operate on a satisfactory margin in Eastern shipping, relieving the local market of the increased supplies and aiding in stabilizing the market.

The feeling is optimistic in all quarters, contributing factors for this being: high Eastern quotations because of egg shortage; better quality of eggs as a result of newly formed producers' association; high cost of other foodstuffs which will increase egg consumption at the present quotation.

ish influence, yet prices show but little change. Consumptive demand good to the extent of the supply, though there was no speculation as hens are laying more freely now and it is the time of year for lower values here on the coast. In Chicago firsts are 3½¢ higher than a week ago and in New York 4¢ higher. This advance, however, failed to influence the market here on the coast. We quote fresh ranch case count...

Extras	34¢
Pullets	35¢
Ranch	34½¢ 35 35 35 34
Extras	33½¢ 33½ 34 34 34 35
Pullets	32½¢ 33 33 33 33 33

POULTRY.

A steady and rather firm market was had the past week for all good poultry. There were no Eastern shipments in and the local receipts were only fair. Broilers, fryers and hens all moved without trouble. Ducks sold in a fair way and there was a good demand for turkeys at full quotations. Roasters also sold without trouble.

We quote from growers:

Broilers, 1½ to 2 lbs.	26¢@27¢
Fryers, 2½ to 3 lbs.	23¢@24¢
Hens, over 4 lbs.	20¢@21¢
Hens, under 4 lbs.	17¢@18¢
Ducks	19¢@20¢
Geese	16¢@17¢
Roosters, 3 lbs. up (soft bones)	22¢
Turkeys, heavy, 12 lbs. and up	28¢@29¢
Turkeys, light	24¢@25¢
Squabs, live, per doz.	\$1.50@3.00
Dressed	3.75@4.85

HONEY.

Stocks pretty well exhausted and the crop is said to have been marketed. Some little demand was had; replenishing stocks, and extracted was advanced ½¢ @ ¾¢. Comb was unchanged. While

there was some little demand there was no disposition to buy ahead, the demand being confined to supplying immediate wants. Beeswax in good demand and higher.

We quote from growers:

Water white, pound	8½¢
White sage, lb.	8¢
Light amber sage, lb.	7½¢
Light amber alfalfa, lb.	7½¢
Fancy white comb, lb.	10¢
Light amber comb	9¢
Beeswax	30¢

HAY.

There was more in the past week, mostly grain hay which was slow sale and weak. While grain hay was slow sale alfalfa was in very good demand and offerings only moderate. Outside dairies as well as those here at home wanting alfalfa and what selling brought more money under the influence of scarcity. Receipts for the week 234 cars.

We quote f. o. b. Los Angeles:

Barley hay, ton	\$18.00@20.00
Oat hay, ton	19.00@21.00
Alfalfa, northern, ton	17.00@18.00
Alfalfa, local, ton	19.00@21.00
Straw, ton	9.00@13.00

BEANS.

The market remains unchanged from a week ago. There was some little movement in limas, whites and pinks at quotations, but blackeyes and tepary were very dull, the high prices causing buyers to hold back and buy sparingly.

We quote from growers:

Limas	\$8.00@8.25
Large white	10.00@10.50
Small white	10.00@10.50
Pinks	7.25@7.50
Blackeyes	5.25@5.75
Tepary	5.75@6.25

Special Livestock Market Report.

Los Angeles, February 6, 1917.

CATTLE: While a steady and fairly good market was had the past week, buyers seemed less anxious for supplies than the week before. There were more offering, and killers in consequence, more independent. But as the Eastern markets were all good and strong there was a sympathetic influence which kept prices up to last week's figures.

Per cwt. f. o. b. Los Angeles:

Beef steers, 1000 to 1100 lbs.	\$8.75@9.00
Prime cows and heifers	7.00@7.25
Good cows and heifers	6.50@7.00

HOGS: There were not so many hogs in the past week and under light offerings and continued high markets East, mixed packing and lights were advanced 25¢ per cwt. Killers were all in the market, and as a fairly active demand was had for fresh pork, they were persuaded to bid up stronger for all good hogs. California and Arizona furnished most of the supply. But few Idaho hogs in.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 250@300 lbs.	\$9.25@9.50
Mixed, 200@250 lbs.	9.50@9.75
Light, 175@200 lbs.	9.50@9.75

Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP: A firm market and good demand was had the past week for what came in. Supply only fair. Utah and Idaho continue to furnish most, and gave us some very good sheep and lambs. Killers all in the market and wanted supplies and more could have been sold here at full quotations.

Per head f. o. b. Los Angeles:

Prime wethers	\$8.00@8.25
Prime ewes	7.50@7.75
Yearlings	7.50@7.75
Lambs	7.50@8.00

CALVES: But few coming in and what arriving in good demand and firm. Selling at \$8.50@9.50 per cwt.

San Francisco, Feb. 7, 1917.

[Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F. Hog prices subject to seller standing one-half of all hogs condemned by government inspectors.]

BEEF CATTLE values received another advance early this week as a result of the continued shortage of supplies. Receipts are sufficient to supply the demand for the time being but killers are fearful of the supply in March and April and consequently are conserving their feed lot supplies as far as possible. Unless decreased consumption results from present high prices packers see no immediate chance of lower prices.

Steers, No. 1 8½¢ @ 9¼¢
No. 2 8¼¢ @ 8½¢
Cows and Heifers 7½¢ @ 8¢
No. 2 7¢ @ 7½¢
Bulls and Stags 5½¢ @ 6½¢
CALVES, light 9¢ @ 9½¢
Medium 8½¢ @ 9¢
Heavy 7¢ @ 8¢

HOGS again advanced on this market with supplies reduced in size, although offerings the early part of the week were somewhat more generous. No Idaho hogs are reaching this market, coming from California points.

[Rough, docked 20 pounds, piggy sows, 40 pounds, stags 80 pounds.]

100 to 150 lbs.	8½¢ @ 9¼¢
150 to 300 lbs.	10¢ @ 11¢
300 to 375 lbs.	10¢ @ 10½¢

SHEEP and LAMBS continue to advance in face of almost famine supplies. Practically everything in the sheep line is cleaned up and what few

lambs that are being slaughtered are mostly from Utah. Killers say they are losing money on sheep and lamb business as they are operating on a cost basis almost as high as Eastern killers and are unable to turn at profitable wholesale prices.

Prime Wethers 9½¢ @ 10½¢
Ewes 8¢ @ 8½¢
Lambs 12½¢ @ 13½¢

WOOL prices remain unchanged with a cessation of buying in the Red Bluff district and some activity in San Joaquin valley reported. A good part of the fall clip is said to be contracted for. No activity as yet is reported from Mendocino. Very little wool moving in Eastern markets but the price is quotably higher and local dealers are looking for still higher prices. War declaration would probably improve prices considerably.

Sacramento Valley, spring clip. 22¢@30¢
Mendocino, year's 32¢@33¢
Southern, spring clip 26¢@28¢
Southern, 7 months 13¢@16¢
Imperial Valley, 7 mos. 14¢@15¢
Nevada, year's 31¢@32¢

Hide trade is still inactive, no demand having appeared for two months but holders here look for an improvement and are holding steadily.

Steers	21¢ @ 23¢
Cows	21½¢ @ 23¢
Light hides, 25 to 48 lbs.	21½¢ @ 23¢
Kip	20¢ @ 22¢
Calf and veal	29¢ @ 30¢
Dry Hides	32½¢ @ 33½¢
Dry Kip	35¢ @ 36¢
Dry Veal and Calf	38¢ @ 40¢
Pelts, long wool	\$2.25@2.50
Short wool	1.25@1.50
Horse hides, wet, large, ea.	5.00@5.50
dry, large	3.00@3.50

North Portland, Ore., Feb. 5, 1917.
CATTLE: With 1300 head of cattle unloaded for today's market the cattle pens were a scene of activity, and there was a very good demand for all good beef. Buyers from all coast butchers and packers having good-sized orders and the large supply was quickly bought up at steady to 10¢

higher prices. One load of prime light beef steers sold at \$9.20 which was 20¢ above last week's top, another load brought \$9.15, several other loads of prime heavy steers brought \$9.00. There was a large supply of the good kind of steers which sold from \$8.30 to 8.50; medium grade steers brought from \$8.00 to 8.25; good quality of light feeding steers sold at \$7.50 to 7.60. The prime cows and heifers were a scarce article although there was a light demand.

SHEEP: There was only one load of sheep on the market today which was a load of prime wool wethers which brought an advance of 25¢ above previous quotations, selling at \$13.50; lambs are quoted at \$11.50 to 12.25; prime yearlings \$10.25 to 10.50; good light ewes \$9.00 to 9.25; prime wethers \$10.00@10.50; prime shorn lambs \$10.00@10.50.

PRODUCE BIGGER CROPS USE AMBOY GYPSUM

California soils are severely deficient of sulphur and other valuable elements so vastly important in the production of BIG crops. AMBOY GYPSUM replaces these locked-up elements and does other wonders. Increases soil fertility wonderfully. OUR FREE BOOK on gypsum facts should be in every rancher's hands. Write at once for it. Tells how, when, where and what gypsum to apply to alfalfa, citrus, garden and other lands. Best booklet of its kind.

Butter on a Conservative Basis.

The local butter market is on a strictly supply and demand basis, dealers finding it difficult to secure enough to meet demands some days. Some supplies have recently been attracted to this market from points that usually ship to Los Angeles and a shipment of seconds was received from Oregon but the trade has readily absorbed all offerings.

Dealers do not look for decline for some time, on account of the shortage of rain in coast counties and high feed prices in alfalfa districts.

Cheese Exporting.

One carload of Jack cheese was shipped from this market to New Orleans and another car to St. Louis early this week, making a total of 20 carloads exported to Eastern points recently. Of this amount 10 cars have been sent from San Francisco. Speculators are carefully watching Eastern markets and further shipments will probably be made if quotations justify.

Remco

SILOS TANKS

For dairymen, farmers, feeders in all sizes and proportions.

For water, wine, oil, vinegar, acids, for storage, mixing, fermenting, pickling.

PIPE

For irrigation, power, water supply, in all diameters and for all pressures. Costs less than any other pipe of equal efficiency and endurance. Outlasts any pipe except cast iron.

All Remco products are manufactured to your order from clear, air-dried redwood. Their outstanding features are highest grade material, superior efficiency, maximum durability, true economy.

California's Flirtation With King Corn.

[Written for Pacific Rural Press.]

IT HAS surely been neither fast nor furious. Thought of it would equip no novelist to impart a thrill; sight of it would cause no movie-fan to flutter. It has had incidents of dramatic value; periods of deep feeling and earnest purpose; deep-drawn oaths of worshipful devotion; but it has broken no hearts and has built no homes, and therefore, because it has realized no potentialities, we call it a flirtation, and we dare to study the details of it because it is such a rarity—an innocent flirtation.

When King Corn first sued seriously for the favor of California, he was but a crown prince, for old King Cotton was still reigning potentate of American agriculture. When Corn became king he continued his quest, promising the golden princess of the farthest west full half his kingdom, and California, on her part, listened indulgently; but, as the affair proceeded, temperamental differences disclosed themselves, and all thrusts at depth of feeling encountered hardpan, and the two are actually no more to each other now than they were sixty years ago. Meantime, the baffled suitors have lived full lives, and mourned not for each other. King Corn has now no rival and is producing annual wealth twice as great as ex-King Cotton, though the latter has taken no backward step, except in his lost sovereignty. California, too, leads the nation in unique wealth-winning, which commands her full interest and devotion. And thus they live and rule apart. As neither could touch the other's heart, their courtship, though not lacking in gallantries and coy encouragement, must be reviewed as an interesting and innocent flirtation.

How Corn Came to California.—Probably corn came from Mexico with the padres in 1769, for our lamented aborigines were apparently Diggers for clams and for toothsome roots and grubs, and not for crops. The padres, though they made a record in corn-growing, seem to have inherited the white man's passion for white bread, and though they probably fed their converts to some extent on Johnny cake, they chose white bread for themselves. They also probably found that hardy wheat, barley, and oats, which would make chief growth during the rainy season, were easier

Eighteenth of a series of sketches in which the Editor presents suggestions, drawn from long experience, of what Californians have done and may do for the Advancement of California Agriculture.

bread and irrigation water into wine would yield less perspiration and more cheer than to expend tillage and irrigation on corn. They also learned, of course, that on the lower, moister lands, like those southward from the San Gabriel Mission (which was their greatest granary), corn

to produce than corn, which had to be kept out of the frost, and therefore was pushed into the drouth. They must have soon seen that a system which turned rainfall into

could be brought through without irrigation, but not without more work than winter-growing cereals required.

Whether this was their reasoning, or not, the fact seems clear that the padres did not count much on corn, and probably imparted this view to their early American visitors, for they, too, largely avoided corn. And the impression seems to have been quite enduring, for the first accounts of farming, after the gold-rush, say little of corn, and the very first shows of produce were rich in tall and productive barley, wheat, and oats, but not in corn. Still corn was grown, for it is reported that in 1856, "many corn crops at El Monte, Los Angeles county, average 80 bushels to the acre and as high as 120 bushels to the acre has been raised." In that year the product of the State was estimated at 165,464 bushels, while wheat was 2,937,236 bushels, barley 3,229,230 bushels, and oats 364,420—which was surely a slow start for corn.

The First Corn Boom—Soon after, however, there arose keen interest in corn, based upon such achievements as these:

In 1857 State premiums were awarded to Dr. L. G. Lyons, Ione Valley, for his crop of heavy and well-rowed white corn, which gave 109 bushels of 52 lbs. per bushel per acre. Also to A. F. Potter of Ione Valley, for his yellow "gourd-seed" corn, which gave 84½ bushels of 52 lbs. per bushel per acre.

In 1859 Charles Green of Ione Valley raised 180 acres of corn, which yielded an average of 87 bushels and five quarts of shelled corn per acre. In 1860 he replanted the same ground, and more, to a total of 250 acres, in one body, "which, in the opinion of competent judges, will yield from six to ten per cent more than the previous year." This corn was grown

(Continued on page 202.)

Above is a glance at the roadside of a large corn field near Stockton. The variety is the Yellow Dent, which is popular in California. Below is a typical ear of Yellow Dent, being the winner of the \$1000 prize at the Fourth National Corn Show at Columbus, Ohio.

EDITORIALS

THE RELATIONS OF A MAN.

CALIFORNIA is fortunate in having the mighty national forests within her boundaries, and the mighty industries which will grow in and upon them, in charge of a man who looks deeply into things and thinks deeply upon the relations of things. Coert Dubois, U. S. District Forester for our California division of the Forest Service, is such a man, and he will unconsciously furnish us the theme of a little homily, which we must rescue from drowning at our pen-point by rolling it over and spreading it out beneath the bright, warm effulgence of our readers' favorable consideration. It has to do with the relations of a man.

In these times, when all the altruism, good Samaritanism and brotherly love of the world seem to be driven to this hemisphere by the growth of opposite attitudes and attributes on the other, it is important that we should try to more fully understand these throbbings of the great heart of mankind which seem to be disturbing the complacency which has overspread American nationalism as the product of our strongly individualized modes of thought and action which have proceeded from isolation and efforts at mastery of the newest and greatest opportunities which have disclosed themselves in the recent history of the human race. It is not, however, upon this great world-movement of emotion and action which we intend to discourse. Such a duty lies upon philosophers, statesmen and orators. We simply make declaration of what seems to us to be a fact, that it may serve as a background for a very simple sketch, portraying by small suggestions what a man, whose aspirations penetrate neither firmament above or beneath, and whose actions lie strictly in the plane of his own immediate environment, can think and do to make himself more fit in the world.

THE JUST DEBTS OF A MAN.

AT THIS point we invite Mr. Dubois to stand beside us on the platform and to speak, but as he speaks an institutional language, peculiar to those who are associated with him, or circumstanced like him, in a great branch of the public service, we shall translate his utterance into terms which serve our present purpose in calling attention to the just debts or obligations of every man, either in public or private undertakings, who aims to lead a useful life, and they comprise debts to the community, to the enterprise in which he is engaged, and to himself as a liver of such a life. Such a translation of a paragraph, recently written by Mr. Dubois, is as follows:

"Many undertakings have for their object public service rather than money profit. Their number is increasing of late in the United States, and there is a spirit abroad in the land which shows that the root idea is taking hold on the public mind and creating a backing of popular sentiment that is not only encouraging to managers in these lines of endeavor, but puts new responsibilities on them to deliver the results called for with a high degree of efficiency. As essential characteristics, the personnel of such undertakings must

have a passion to serve, a breadth of vision, and an ability to see concrete facts and situations from an abstract point of view. But even with the whole force imbued with these qualities, unless it has in addition certain features of the successful industrial undertaking, it will fail. It must have intelligent management, economic production, a valuable product, and a real market.

Mr. Dubois made his declaration to those engaged in his branch of the public service. We have only broadened it so that it may apply to every man who wishes to do anything well, for the good of the community, of his associates, and of himself.

THE DUTIES OF A MAN.

IN ORDER to discharge the above indicated debts and obligations, a man has duties to perform. In his studies of public service, Mr. Dubois arranges these in units and makes time usefully spent the basis of the unit in calculation, and we translate from him, again applying the same expanding process noted above:

"The unit of time being an hour, we will define a unit of service as one hour, all sixty minutes of which are devoted to profitable activity. We immediately find that the service may be delivered directly or indirectly; that it falls into three classes:

- "1. Unit of service to the community.
"An hour's work, all sixty minutes of which contribute directly to human welfare.
- "2. Unit of service to the enterprise.
An hour's work, all sixty minutes of which contribute directly to increasing the achievement of undertaking in which he is engaged.
- "3. Unit of service to the man.
"An hour's work, all sixty minutes of which contribute directly to increasing the power of the man himself to render service to either of the above.

"The only way to apply this measure is to so record the work done in a day, or a week, or a month; that each day's performance may be shoved out in the open, where it can be seen, analyzed, and picked apart."

It is an interesting and somewhat unique fact that Mr. Dubois did not try out his prescription on some yellow dog of a subaltern of his, as too many reformers do, but became himself a "forester" (the least of forest officials), and tried out his medicine by taking it himself. His confession of the result was good for his soul, and it is good for our souls also. After keeping tab on himself, with pencil, note-book and watch, for twenty-two days he tabulated the data and found that he had been less than half a man, for he had rendered but 48 per cent of efficiency, of which 22 per cent was public service, 21 per cent service to the institution, and 5 per cent service to himself—and 52 per cent of the possible units of time inadmissible to the efficiency record. For the sake of the homily we must say: How many of us use less than half our time to advantage, and how many of us know it?

HOW DUTIES ARE SHIRKED?

FORTUNATELY, Mr. Dubois' record gave him clue to how time was lost, and the hints he gives of the ways may be very widely suggestive and useful. We ask him to speak this time almost without translation on our part:

"There are many influences which tend to reduce both the quality of the valuable accomplishment and the quantity of it. Some operate through wasting time such as unperfected plans—not knowing exactly what one set out to do or exactly how one proposed to do it until one got on the job, and then taking the time to figure it out. Aimless talk and profitless discussion is a big time eater. Not talk, which is clean cut and to the point, or talk contributing to acquaintance or friendship, but the rambling, inconsequential drift of which one hears and does so much. Another time-waster is failure of co-workers to arrive. This cannot always be avoided, but one does not always do one's best to avoid it.

"Some of these time-killing influences are physical, such as heat and fatigue, poor bodily condition, hunger, discomfort, horse troubles, or plain laziness. Some of them are mental; like failure to think ahead and see what is coming, pure bone-headedness, or inability to grasp the significance of facts, too much hurry, worry over family affairs, or a desire for companionship strong enough to make one quit the job before it is well and thoroughly done. Lack of the right tools and the use of cumbersome makeshifts is another factor lowering productive time, and still another is faulty supervision, which may give too little

instruction or too much—too rigid and complex for the job in hand.

"By concentrating our effort on things which contribute directly to service, to increasing the power of the personnel and facilities of the undertaking to deliver such service; and directly to the improvement of our own stock of serviceable knowledge, we perform more valuable work. To increase our output we must plan the use of our time carefully in advance, plan out each specific job, see that the tools are at hand when we start, keep our minds on getting it done, and keep them off our personal troubles—and then WORK."

HOW SHALL WE BE JUDGED?

COURSE, the proper way to close such a sermon as this is to appeal to our intellects and consciences to help us to be just judges of our own attitudes toward our jobs and of our actual performances therein. But this old test, which has served mankind so ill and so long, is now available only to editors and a few other self-willed and rebellious classes. All other classes are already well within the jurisdiction of the "efficiency engineer." Possibly some readers have not apprehended the fact that agriculture, by act of Congress, approved July 17, 1916, and commonly known as the "Federal Farm Loan Act," is now under the complete domination of the new industrial god—Efficiency. How is that? Well; it is this way: No one can borrow money on farming land with government co-operation unless he is accepted as a member of a Farm Loan Association composed of his neighbors, who personally know and are willing to co-operate with him and to accept a degree of liability for him. No one can obtain a loan without approval of those who admit him to financial fellowship with themselves, and this will include not alone an appraisal of his landed security, but, to some degree, an approval of his purpose in borrowing and his ability to use the money to advantage in some line of production. And beyond the local Farm Loan Association, there are two powerful bodies—the District Land Bank and the Farm Loan Board, the central authority at Washington—which are empowered and are liable to review the transaction. Thus both the land, and the purposes and standing of the man, have to join hands and vault together three barriers which cannot be run under. Occasionally some one indulges in a moan that agricultural security will become of less repute because borrowing by farmers is being made so easy. It is a wholly unwarranted lament. Borrowing will be made more easy, economical, and fair to farmers who are endorsed by neighbors as responsible, energetic, and competent to use money in ways which the judgment of these neighbors approves as reasonable and practicable, and for which the borrower has demonstrated some pretty definite knowledge and understanding. The law does not say all these things, but one can clearly read them in the provisions which make it impossible for an individual to take the first step toward a loan without the approval of those who know best and can best judge, not only the quality of his land, but the quality of his manhood and his ability and determination to make good in a line of extension or improvement which their acceptance of him as a fellow-borrower indirectly indicates.

Thus there seems to arise in our agriculture mutual obligations which are old in American sentiment, but somewhat newer, perhaps, in American rules for industrial practice—the obligation upon all to help each; the obligation upon each to deserve such help. Industrially, of course, these obligations rest upon efficiency recognized and efficiency demonstrated.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco, for the week ending at 5 p. m., February 13, 1917.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		To Date	Normal To Date	Max'm	Min'm
Eureka	.20	16.76	27.86	58	36
Red Bluff	.02	11.16	15.57	68	38
Sacramento	.04	6.58	12.24	68	42
San Francisco	.36	10.52	14.39	64	42
San Jose	.20	6.70	10.30	70	34
Fresno	.00	5.23	5.86	72	38
Independence	.34	15.33	12.21	68	36
San Luis Obispo	.02	9.94	9.54	76	41
Los Angeles	.34	7.00	6.20	68	41
San Diego	.34	7.00	6.20	68	41

*A very light rain (T) occurred at Fresno on the 11th.

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Subterranean Slugs?

To the Editor: What can I do to my seed potatoes to keep slugs from eating them? It must be something put on the cut seed. I have heard complaints of the slugs eating the potatoes up after planting, before they come up. Can the seed be poisoned to kill the slugs without damaging the seed? If the potatoes can't be poisoned, would covering them with air-slaked lime keep the slugs from eating them and not hurt the seed? I expect to plant 120 sacks and am very anxious to know. One of the neighbors planted \$3 worth of seed last spring, and they ate them up.—E. E. C., Yucaipa.

We never heard of subterranean attacks by slugs. Either they have profited by the example set them in the current war or you use the term slug rather broadly. Wireworms and some other insect larvae or millipeds can do what you describe, and though destruction of underground pests has been undertaken for generations no thoroughly satisfactory treatment has been demonstrated to be cheap enough for a field crop to stand the cost of it. Paris green and other arsenicals can be used on cut potatoes put into the ground as a trap for pests, but these poisons cannot be used on potatoes which you wish to grow. Though often tried they have not been approved. Lime will not hurt the potatoes nor the insects either, for lime soon stops burning* and is not poisonous. If the land has not been recently used for roots it may be pretty clean—unless it is the dry land wireworm of the west which has taken possession. Rotation and cleaning by drying, baking and starving on a clean summer-fallow, is the best known way to reduce these ground pests.

Large White Beans and Weevils.

To the Editor: I intend to grow large white beans without irrigation. I have plowed nine to ten inches deep and intend to plow again about the last of March and cultivate regularly. When will it be proper time to plant and will the large white be right to plant, or some other kind? Some say if planted too early the bean bugs will get in them. Do you think I can keep the moisture up by cultivating them to get fairly good results?—J. V. S., Lodi, Cal.

Whether you can get and keep enough moisture depends on the coming rainfall and the character of the soil. We do not know either.

The large white or Lady Washington bean is the least grown commercial bean of California and is generally counted the most finical in its requirements. It is chiefly grown on moist river bottom lands and as it resents hardship, the pink and blackeye are preferred for plains. It ought not to be largely planted in any place where its good behavior is not well demonstrated by experience. All beans except the broad (locally called "horse bean") should not be planted until frost danger is over in the particular place of planting. We have not heard that the weevil could be avoided by later planting. It goes on the watch early and keeps awake all summer by several generations. It is liable to attack the pod soon after blooming and to keep at it even after the ripe beans get into the sacks. If readers have definite conclusions as to escaping it by later planting we shall be glad to hear them. It seems to be a fact that large beans are less infested than small, but that itself does not help much if the larger varieties do not suit one's growing con-

ditions. It is better to have weevils for beans than no beans for weevils.

Growing Young Lemon Trees.

To the Editor: I have lemons set out in a canyon in the Santa Monica mountains. There are two kinds of soil, a sandy loam and on the side hills the ground is heavy and composed of clay and shale. The latter ground looks nice and black, but the trees don't do very well. I have thought I should fertilize heavily. The trees were set out two years ago. What kind of commercial fertilizer should I use on each kind of ground? Does cow manure have to rot to be of value to me? How should I apply chicken manure? I have to use a basin system of irrigation: will filling a basin, six inches deep and as large in diameter as the foliage of tree, once a month be sufficient water?—R. G. M., Sherman.

Brief description of physical features does not give sufficient data for prescription of special fertilizers for these two different soils. Use what the manufacturers call a "complete fertilizer" for fruit trees. Cow manure can be used fresh by surface application. You can half fill your basins with it, allowing a season's rainfall and irrigation to leach the contents into the soil—digging in the refuse when re-basining. If the ground admits, the basin ought to be a little larger than the spread of the foliage. The amount of water you mention ought to be quite enough on the average for the young trees. Dig down and see how the subsoil is in summer: the heavy soil may need less and the sandy soil more. Chicken manure should be thinly spread or scattered. There should not be much in a place nor too much on the whole.

Red-Humped Caterpillars.

To the Editor: In "California Fruits" we are advised to spray with either lead arsenate or Paris green to rid trees of the "red humped caterpillar." Will these sprays have a lasting effect for the season, or must one spray from time to time as the eggs of the pesky things hatch out?—E. R. H., Oroville.

These caterpillars are usually found in bunches, feeding at first near the egg-masses from which they emerge and spreading as it becomes necessary to attack more distant foliage. If you begin looking after the leaves are well out, say in May, you can get rid of most of them by cutting and burning the infested shoot. If you find them too widely scattered for that, spray with lead arsenate. They are slow about starting in and you may not notice them until June or July if you do keep looking sharply. Probably one spraying then will get most of them, though they may keep on hatching out somewhat later. Good cultivation in early spring, especially hoeing well around the trees, will cut off many of them, for the moth comes from a pupa in the ground then and lays eggs on the tree. It is from these eggs that your later trouble comes.

Strawing and Dipping Potatoes.

To the Editor: Is straw gathered from around an old straw stack good for potatoes? If so, how much should be used per acre? I would like to know a formula for dipping seed potatoes and the best time for planting to get them early.—R. M. B., Sacramento.

Straw would have been an excellent thing for potatoes if plowed under last fall. As late as this

we would not plow it in, but would plant next month (if you are not in a very frosty place) and scatter the straw on the surface over the rows after planting. It may help you to get early potatoes by protecting the shoots from frost and they will come up through it all right. If it is short and brittle it will not interfere enough with cultivation to hurt. Uncut seed potatoes, to prevent scab, are soaked for two hours in formalin solution—one pound of formalin to 30 gallons of water. If you wish to cut the seed do it after drying them.

Endives.

To the Editor: I have been informed that the endive that is offered for sale here is grown in Belgium and imported. I am also informed that they are grown in California. How are they grown?—J. R. M., San Francisco.

Why we are leaning on the suffering Belgians for endives we cannot tell. We ought to be ashamed. Endive is grown just as lettuce, and is easier to grow in winter because it likes chilly weather better. There is this difference, however: Lettuce blanches itself by heading up like cabbage. Endive does not do this and the straggly growth has to be gathered up and tied above. Californians like lettuce better, and endive has less chance and is chiefly used by hyphenates. It is not a special or commercial crop. It is grown in market gardens by foreigners, largely for foreigners or for others who have brought back a liking for it from their European tours.

Pollination of Japanese Plums.

To the Editor: Why does the Wickson, which is such a heavy bloomer, set so few plums? Do they require some other variety planted with them for pollenization? Have several acres of these and so far they do not set as heavy as I think they should for the amount of blossoms they produce.—A. C., Acampo.

It is perhaps fortunate that these free blooming varieties do not set all their fruits. If they did the cost of thinning for commercial sizes would be frightful. But of course you are right in desiring fuller bearing. As you intimate, this can be secured by cross-pollination and the Japanese varieties seem to help each other. It has long been observed that Wickson is helped by Climax, and presumably is also served by other varieties which bloom with it. Put in a few grafts this spring and you will soon see if isolation is your trouble.

Transplanting Evergreens.

To the Editor: We wish to move some native pine trees to our garden—the soil being the same and the distance short. Is there any special way of moving that will insure success?—R., Neenach.

Take quite small trees and trench around them so you can take up a ball of the soil about a foot in diameter, enclosing the roots. Do this after the coldest weather is over, when soil begins to warm up and the air has the spring feeling in it.

Oak-Leaf Mold.

To the Editor: We are planting out a small orchard and, as the soil is open and porous, would it be a benefit to put leaf mold from live oaks near, in the holes when setting the trees?—R., Neenach.

Such accumulations are often too sour. It is safer to enclose the roots of the young tree in the best of the open surface soil you have and spread the leaf mold after planting to act as a mulch, to become sweetened by aeration and worked in by subsequent cultivation.

TREES THAT GROW!

FRUIT TREES FROM ELMER BROS. NURSERY GROW!

They are clean, strong, healthy, full of life, and well-rooted. They're the kind of trees that produce thrifty big-paying orchards.

It's profits you want—and profits are what you get from trees that come from us.

And here's an important feature: our budding and grafting is all from trees of known record and proven productiveness.

Yucaipa Valley Apple Conditions.

A seven-year apple country of more than 5,000 acres of healthy, well-kept, vigorous, uniform apple trees grown by people who have shown a great co-operative spirit.

[Written for Pacific Rural Press.]

Standing on the reservoir dam above Yucaipa, you look down over 5,000 or 6,000 acres of the thriftiest, cleanest, most uniform young apple trees in California. The oldest of these are scarcely seven years. Their thrift and freedom from disease are partly due to a climate which could scarce be excelled for human living, partly to a deep decomposed granite soil, partly to plenty of water. But all of these advantages would also encourage the insects and diseases that make apple growing profitable where they are not.

Three years ago there was far less acreage of trees, practically no spraying had been done, the trees were not in as good shape as now, and diseased trees were being planted in superb defiance of the future. It was about then that the "Protected District of Yucaipa" was formed under the county ordinance permitting districts to protect themselves against diseased trees. Since then every tree is held in quarantine until inspected by J. B. Hundley, the District Inspector. Mr. Hundley estimates that in the past three years, some 15,000 or 20,000 apple trees have been destroyed here on account of disease, mostly hairy root, crown gall, and nematode root knot. This would have caused a lot of damage had the trees been planted, as occurred in previous plantings.

Pests.—There used to be a few flat-headed borers in the colony, but there are scarcely any now. Neither are there any scale, and very few woolly aphis. Mildew is seldom of importance enough to fight until the trees come in bearing. It is then controlled, without additional spraying, by adding 12 pounds atomic sulphur per 2½ pounds dry arsenate of lead in the first codling moth spray. Seldom is it needed in the later sprays. No scab has developed in the district. Codling worms must be fought from March till September, as will be told elsewhere. Brown almond mites are also troublesome.

Much of the immunity from insects and diseases is due to spraying every year with lime-sulphur just before buds break, as nearly as convenient. Mr. Hundley vouches for orchards on at least 110 acres that

have been sprayed thus annually without ill effect, but still with clean soft bark full of life. This spray is for the brown mite eggs and a general clean-up. It will commence about February 10. Last year 98 per cent of the trees in the valley were sprayed; the year before, 90 per cent were sprayed. By the county ordinance, all power spray rigs are licensed so long as they do good work as judged by the district inspector. Hand-power sprayers are also licensed, for dormant spraying only. There are now about 24 spray outfits in the Valley besides half a dozen hand sprayers. Mr. Hundley aims to inspect the work of each of them twice a day in spraying season; and if any are not doing good work, even on their owners' places, their licenses are revocable. The county pays two-thirds of the inspector's salary; the Yucaipa Apple Association pays the other third.

No Sunburn.—Mr. Hundley believes that a hide-bound condition of tree trunks is due not to sprays, but to sunburn. That there is so little sunburn, and therefore so little encouragement for flat-headed borers in Yucaipa Valley, is considered due to the annual whitewashing given the trees. Over 60 per cent are estimated to have been whitewashed annually from the start. The Government formula seems to stick best. It is applied by hand, even upon the second and third years' growth.

Early February is the time; for in late February about Yucaipa there is usually a hot spell before sap has begun flowing; and then most of the sunburn would occur. There is also a hot spell in October and November when damage may come if the whitewash has not stuck or been renewed.

Organized before Crop Grown.—Last year the first apples were shipped commercially, yet the Yucaipa Apple Ass'n is five years old and comprises 120 members, according to G. E. Jenkins, editor of the Yucaipa News, which reaches all the growers in the Valley and the local land owners out of the Valley.

The Association built a packing house including an up-to-date apple grader; but the coming year a real crop is expected and the packing

CIDER GONE WRONG.

To the Editor: Last October I made cider for vinegar. To every fourteen gallons I added one gallon of water. In about three weeks I drew off, rinsed the barrel and put the cider in again. Now there is a white scum on top. The cider lost its color. It is nearly as white as water and has not one-fourth the strength of good vinegar. What can I do to make it good?—J. H., Greenfield.

[Answered by Prof. W. V. Cruess.]

I judge that the trouble is that the cider was diluted too much by the addition of water. This promotes the growth of a white scum, known as "wine flowers," on the surface of the fermented cider. The wine flowers' growth destroys the alcohol of the cider and in this way prevents the formation of sufficient acid. It would be difficult to prescribe a treatment for the cider unless an analysis were made. If a sample of the cider (about one quart) were sent to the Enology Laboratory, Fertilizer Control Building, University of California, Berkeley, California, we should be glad to analyze it for you and could then be able to tell whether the material can be made into a good vinegar or not. As an experiment, you might try mixing two gallons of this weak vinegar with one gallon of strong vinegar. It is possible that the vinegar mother from the vinegar will overcome the action of the wine flowers.

TALKS ON Nitrogenous Fertilization

Number 9

YOU have often asked yourself how much good comes from the nitrogenous fertilizer you use. That depends largely upon the ability of your soils to hold and convert it into nitrate nitrogen.

SULPHATE OF AMMONIA

is held in the soil by humus compounds until the beneficial bacteria have transformed the ammonia into available plant food.

Partly because of the small quantities ordinarily applied as compared to the large mass of earth it fertilizes, Sulphate of Ammonia is readily nitrified even in soils poorly supplied with humus.

Dr. Lipman of the Berkeley Experiment Station states, in Bulletin 260, that "definite nitrification of Sulphate of Ammonia nitrogen, occurred in all soils tested without apparent exception." Further on he notes that Sulphate of Ammonia is particularly adapted for use on arid soils because of the apparent ease with which it is nitrified in them.

This means that conditions existing in California soils are exceptionally favorable to the use of Sulphate of Ammonia. Its action should be noticeable within from nine to fourteen days.

ARTHUR CANN, Seedsman,
SAN JOSE, CAL.

house will have to be enlarged several times over, for Mr. Jenkins points to 2,000 acres just about to bear their first good crop. The Association conducted an apple show last year which advertised the Valley far and wide.

Water.—There are two or three water districts owned by the land owners on the share-per-acre basis. The central part of the Valley, which is practically all in orchards now, is supplied from mountain canyons via tunnels and aqueducts to a reservoir some hundreds of feet above town. They also have two wells, one of which supplies 110 inches of water; but these were not used the past season and there was still plenty of water in the reservoir when it was cleaned out after the irrigating season was over. The mountains are usually more or less covered with snow through April, and the watershed is ample. The South Mesa and the River Bottom Districts are supplied by wells, though there is but little fruit yet in the latter. Practically all of the orchards have concrete underground irrigation pipe.

Varieties: Rome Beauty occupies by far the largest acreage of any one variety, according to Mr. Jenkins, with Stark's Delicious, King David, and Winesaps in the order named. We found other varieties growing in quantity; and one man, J. W. Fulton, has 84 varieties on two rows of his place, for experiment. That the Yucaipa Winesaps keep splendidly is attested by the writer, for whom ye editor pulled out on Feb. 2 from his table drawer an apple that had never been in cold storage. It was solid dark red, sound and juicy, and of fine flavor.

FRUIT PLANTING IN SAN LUIS OBISPO.

S. V. Christierson, horticultural commissioner of San Luis Obispo county, advises us that at the present time some 10,165 acres are planted to fruit trees of different varieties in his county, of which 2400 acres are now bearing. About 3000 acres are planted to almonds and this season 2000 acres of almonds will be planted in the Paso Robles and Templeton districts. The estimate made by Mr. Christierson two months ago indicated that 2000 acres would be planted to fruit trees in this county during the spring of 1917. By February 1st enough trees had been shipped in to plant 3500 acres, so that actual plantings will probably exceed estimate by 100%.

JAPANESE PEAR ROOT AND OAK FUNGUS.

To the Editor: Noting the inquiry of O. S., Napa, regarding danger of oak-root fungus to pear trees on French and Japan roots, I wish to say that we have lost a number of pear trees on French root from this cause during the past three years, but thus far have had no deaths from the same trouble on pears budded on Japan roots.

Of course this does not prove that Japan root may not be equally susceptible, but under apparently similar conditions it has thus far appeared to suffer no injury.

I am convinced that we are attributing to French root a degree of immunity from the oak-root fungus that is leading some of us to erroneous conclusions. A. L. Wisker, Grass Valley.

Thank you; it puts us on the road to wisdom.—Eds.

plant Germain's proven seeds!

Take no chances—insure absolutely perfect results by planting Germain's thoroughly tested seeds. Germain's seeds are specifically adapted to southwestern soil and climatic conditions. A half-century of successful experience in seed production is the record of the Germain Seed & Plant Company. The people of the great Southwest have learned to depend upon Germain's seeds—and Germain's seeds ONLY—for perfect planting results.

Mistakes in Pruning Sultanina.

[Written for Pacific Rural Press by Prof. F. T. Bioletti.]

When the Sultanina was first grown in California under the name of Thompson's Seedless it was pruned short like a Muscat, with the result that it produced many tons of inferior fire wood, but few grapes. This mistake is no longer made.

High Stakes.—It was soon learned that short pruning removed nearly all the fruit buds and that long pruning with fruit canes was necessary. Accordingly these were left and tied vertically to 6-ft. stakes. The results were one, or two, large, occasionally enormous, crops, followed by small and irregular crops.

The fruit canes during the first one or two years were good, but their position shaded the heads of the vines so much that no new fruit canes of good quality were produced for the following years. This mistake is still very common.

Trellising.—For years it has been known that even larger crops can be obtained by trellising the vines and tying the fruit canes horizontally to wires. This places the canes in the most favorable position for fruiting and leaves the head of the vine the air and light necessary to develop new canes for the following year.

These canes will develop, however, only on condition that the vine has surplus vigor after starting all the shoots it can on the fruit canes tied to the wire. If too many fruit canes are left, or if they are left too long, the canes for the following year will be absent or defective.

How Many Canes Should be Left?—Many growers, encouraged by the large crops obtained from 3 or 4 canes, have increased the number and increased their length in the hopes of correspondingly increasing the crop. This can be done only up to a certain point. Beyond that, the crop does not increase. There may be more bunches and more berries, but they will be small and lacking in sugar. The increase of fruit canes is carried so far that sometimes 6, 8, 10 or more canes are left to a vine and these are left as long as possible, 6, 8 or 10 feet. The results are always disastrous in the end. The least harmful result is a year of heavy bearing of inferior grapes followed by a year or two of poor bearing during which the vine is recovering the strength necessary to produce good fruit wood. Often it is worse. Sultanina vines by the thousand have died as a result of this form of over-pruning. It may not be strictly correct to say that the vines bear themselves to death, but at least they are so weakened that they fall an easy prey to drought or other unfavorable conditions.

A Demonstration.—Some observations at the Davis and Kearney experiment vineyards throw light on the question of how numerous and how long the fruit canes should be.

At Davis in 1916 a block of 240 6-year-old Sultanina vines gave the following results:

Average number of canes per vine	3.63
Average total length of canes per vine	16.50 ft.
Average No. of fruit buds per vine	55.86
Average No. renewal spurs per vine	4.66
Average lbs. of grapes per vine	49.30

This shows that, with an average of less than 4 fruit canes to the vines, and an average length of each cane of about 4 feet, the Sultanina bore at the rate of over 14 tons of fresh grapes, corresponding to 3¾ tons of raisins per acre. This is three times the average crop of this variety for the whole of California.

The results at Kearney were even more striking. Here the vines were of various ages, the oldest 5 years. The vine with the largest crop had 4 canes, averaging 4 feet each. It bore 139 lbs. of grapes or 6 trays. One vine with only 2 canes averaging 4 feet each bore 102 lbs.; one vine with a single cane 4 ft., 8 in. long, bore 60 lbs.

Conclusions.—These results demonstrate clearly that the excessive number of excessively long canes so often left are not necessary for maximum yields. Observations demonstrate, also, almost as clearly that this excessive amount of fruit wood results in a serious weakening of the vines. All the Sultanina, both at Davis and at Kearney, in spite of their remarkable crops, have produced a fine, vigorous growth of new canes which promise equal crops for next year.

In this year's pruning we have adopted the rule of leaving not more than 4 canes nor a total length of fruit wood of more than 16 feet to the most vigorous vines together with 5 to 6 renewal spurs. For vines showing any weakness a smaller number are left.

Univ. of Cal., Berkeley.

Although Tulare county growers did not expect to realize much on the fruit still on the trees when the recent heavy frosts visited that district, reports from there state that the grading machines which have been installed in the packing houses indicate that there will be 50 to 75 per cent of the crop saved.

Budded Avocado Trees

Selecting Walnut Nursery Trees.

[Written for Pacific Rural Press.]

We listened to a tale of discouragement from a Chino rancher who had tried to grow young walnut trees, but lost a large percentage of them. A few he found welded together at the union like iron would weld if too cold. Others were "club rooted," two or three inches across where they had been cut off when dug in the nursery. All of the roots had been shorter than he desired. But he told us of a neighbor, W. D. McCroskey, who got the sort of trees he wanted, and who was very particular what he got. We found that Mr. McCroskey had set 500 budded Placentias late in the spring of 1915 and had lost only three trees the first year.

Mr. McCroskey made a contract with his nurseryman, covering the kind of trees he was to get, and inspected each one personally before it was planted. Only one-year tops were desired because two-year trees are likely to have clubby roots, too much of them having been left in the soil when digging the trees. He insisted on every root being 30 inches long, or more. Because in hard soil such a specification is hard to enforce, he got his trees from a nursery on lighter soil. California black walnut roots were specified because he thinks English walnuts overgrow Eastern black roots.

The entire tops of the trees had to be delivered so he could see what they were and could cut them off at the last minute before planting so they would not dry out. Length of

the top was not considered so important as stockiness, but Mr. McCroskey called for trees on which the buds were plump and all there from points 2½ to 4 feet up. Careless handling of walnut nursery trees often results in breaking off the buds and setting the growth back at those points. Every tree union was examined, though there is less trouble that way now than formerly. He looked down each tree to see if any "blight" blisters had been there, for they kill the wood to the pith. How he planted them makes another story.

COACHELLA FIG NOTES.

[Written for Pacific Rural Press.]

From 86 fig trees 11 and 12 years old, Fred N. Johnson and his father, J. H. Johnson, of Coachella Valley, shipped 1045 boxes and crates to various California and Arizona points last year. None were dried. The boxes are 11x18 inches and 1¾ to 2¼ inches deep according to the size of figs packed in them. They held about 8 pounds gross. Crates contain 4 five-pound baskets as for shipping plums, apricots, etc.

Varieties.—There are three varieties, of which the Black San Pedro seems to be the leader. White San Pedro and Black Mission are the other two. Trouble in adequate caprification prevents growing of Calimyrnas. The black San Pedros are much larger than Missions, making only four across in the 2¼-inch boxes, and seven lengthwise. They do not sell for as much per box, however, as the Missions. The whites have a milder flavor than the blacks. Missions keep better than the other kinds.

Pruning.—The white San Pedros are not pruned heavily, because that would take off the crop. The Black Missions needed topping, according to Mr. Johnson, but this could be neglected better than the other work. It was remarked that fig trees of unknown antiquity at the wet spots near the mountains are still producing freely, though never pruned.

Black San Pedros, however, were being given their annual cutting back the last of January, though Mr. Johnson said that the time of pruning is of little consequence. The way it is done, however, is important.

What About Your Irrigation Pipe?

Owing to conditions existing in the iron market and also to weather conditions, we suggest you order early

AMES IRVIN IRRIGATED PIPE.

We have a complete stock, and can make immediate delivery. AMES IRVIN PIPE is solid and strong, with no holes in steel. Each sheet is edged-locked together, and then set down under 3500 pounds pressure. Such seams will not break or leak. Send for booklet giving complete information about Irrigation Pipe and its construction. Get it today.

Plant Roeding's

WALNUT TREES

For Profit

Walnut growers have prospered in California. The owner of a good walnut orchard has been the envy of his less fortunate neighbor. There are thousands of acres in our great valleys and along the coast that are suitable to walnut culture.

We have a splendid stock of young, thrifty, grafted walnut trees of the best types, and urge prospective planters to place their orders at once as the quantities on hand of some varieties are getting limited.

The Pecan

ANOTHER VALUABLE NUT.

In addition to the Walnut, the Pecan is going to prove a most valuable acquisition to our list of nuts.

Nectarines

We recently called attention to the growing demand for Nectarines, and we want to again emphasize the importance of planting Nectarines. Write to us for prices and best varieties to plant.

Persimmons

More and more importance is being attached to the Persimmon as to its value commercially. It is a fine fruit, and should be planted more extensively. No garden or orchard is complete without persimmons, so be sure and include them in your order for trees.

Get Our Big Illustrated Price Catalogue

Every fruit grower or prospective fruit grower should have a copy of our catalogue, which is one of the most complete we have ever issued. It is attractively illustrated; lists and prices over 2000 varieties of fruit and ornamental trees, vines, shrubs and plants. This book contains a lot of valuable information which every grower should have. If you haven't already sent for a copy, do so today.

What is Not Being Planted.

To the Editor: It seems to me that in planting fruit upon a piece of land I have in mind, I ought not to plant what everybody else has planted or is planting, but something different which is likely to come into good demand. You are writing nearly all the time about what is being planted. I would rather know what is not being largely planted.—Intending Planter, San Francisco.

You have a right to enjoy your philosophy and we will try to give you the facts you desire.

In pears people are planting very few of other kinds than Bartletts and are disregarding the chances in winter pears. Aside from the shipping demand our local pear-lovers have been complaining of failure to find good winter pears in our California fruit markets.

Cherries are not being largely planted regardless of the canners' demand and the general fact that the Pacific Coast has to supply nearly the whole country with sweet cherries and that California cherries ship better than those from States farther north because drier air

makes them much better shippers.

Plums are being neglected by planters generally, though Mr. McKevitt, one of our wisest growers for shipping, is showing his faith by his works in plum planting.

Apricots are not being largely planted though our own belief is that in places well tested for apricots, there is no more promising fruit.

Prunes of the larger varieties are not being largely chosen. Planters seem to be showing their "Entente" sympathies by going their all on French and neglecting Imperial and Robe de Sargent as though they belonged to the interior emperors and warriors.

Freestone peaches are not favorites with planters this year, and yet the freestone peach is the greatest out-of-hand fruit eating in the world.

Very few are planting quinces, though California grows the best in the world for size, beauty and quality.

The planting of olives is not large in spite of the propaganda which is being carried on by growers and canners to develop the Eastern demand for this fruit.

Almonds and walnuts are popular with planters, and those who need these trees should not delay in getting them, but pecans are neglected and if one has land in the interior valleys with plenty of moisture and good chances of frost, he might well be taking chances with this very popular nut.

Wet soils, even with a touch of alkali, might also be tried with pomegranates, which are not largely grown. The University of California has just issued a bulletin on this fruit which you can get by applying for it at Berkeley, which will have the effect of pushing this very poetic, artistic and romantic fruit. It particularly emphasizes the characters of the variety rightly called "Wonderful."

Persimmons of Japanese origin are also a neglected fruit which we are just beginning to appreciate, both for fruit and ornament.

Citrus fruits, oranges, lemons and pomelos, are also slowing up in planters' calculations this year and yet they are beyond all other fruits in achievements and popularity, and we are not likely at all to have too many of them for the needs of the people of this continent who must get them from us.

Thus you may know what is not now being largely planted.

WIREWORMS AND SLUGS.

To the Editor: To get rid of wireworms tell the Marysville man to sow 6 bushels of the cheapest kind of salt he can buy on each acre infested by the worms and that will effectually settle them. For slugs sow 4 bushels of air-slaked lime after dark and against the wind. It is no use sowing it in the day time as they are hiding under the ground and come out only at night. These remedies are used by British farmers and have proved effective.

San Jose.

Sam'l Haigh.

We have reason to doubt the efficacy of these prescriptions under California conditions, but they are worth trying because of their historical record.—Eds.

Pears

Magnificent **BARTLETTS** in 4 to 6 grade—very strong roots. Also **COMICE** in 3 to 4—"stocky" trees with abundant fibrous roots.

A limited quantity of **BARTLETT** and **COMICE** in 2 to 3 ft. grade—spring buds budded too late to make tall growth, but rooted as well as many larger trees. Special prices.

A few **A. J. COOK**, the new winter market pear. High quality and equally desirable for the family orchard. All pears on blight-resistant roots.

Plums

TRAGEDY on peach root in 3 to 4 and 4 to 5 ft. grades at special prices.

Prunes

FRENCH on peach 4 to 6, strong trees, extra good roots.

Almonds

DRAKE, **NONPAREIL**, and **NE PLUS ULTRA** on peach and almond roots. Strong trees, heavy caliper.

The most exacting orchardists in the State buy our trees year after year—and **THAT** means something.

LIGHT DRAFT PLOWS

Built for the Field Test.

Three-Quarters of a Century of "Knowing How" Hammered Into Every One of Them.

The product of the Parlin & Orendorff Co. has always been noted for simplicity of construction, great strength and ease of operation. It was upon such a basis that the founders of this business made their implements, established their reputation, and built their factory. It is upon the same foundation that the business has been carried on to this day, and in 1917 we celebrate our Diamond Jubilee; 75 years of practical experience gained through constantly striving to provide for the exacting requirements of three generations of American farmers.

For an even three-quarters of a century we have met the demand, and today we operate the largest and oldest permanently established plow factory in the whole world. "It's the way we build them."

P&O
Light Draft Plows, Harrows, Planters and Cultivators are made in all types and sizes, to meet the conditions in all sections, and are Backed by an Unqualified Guarantee.

We also make the most complete line of Tractor Engine Plows produced, and we have a special catalog devoted to these famous plows.

The P&O Little Genius Engine Gang Plow

was the most popular plow shown at all points on the 1916 National Tractor Demonstration.

We will send P & O Catalogs to any address. While P & O Implements are sold only through established implement dealers, we welcome correspondence from farmers in all sections.

ORCHARD GRASS AND LIQUID MANURE.

To the Editor: In the Willamette Valley, Oregon, the farmers sow orchard grass on the mountains, where there has been brush burnt (in the ashes) in the fall, and I have seen seed threshed from the same to the amount of \$20 per acre. They never irrigate in Western Oregon and she is some dry there in the summer, especially on top of the mountains among the rocks.

Liquid Manure.—I would consider it much cheaper for the farmers to build a concrete basin, to dump their manure into, and keep plenty of water on it, than to let it pile up around the barns, and in a few years the barn is rotted down or ready to be moved. There would be but a cost to make a concrete basin, and it would last a lifetime; and whenever he wanted plant food, he would have it on hand without buying it.

Gridley. C. H. S.

[Orchard grass is also grown profitably in California on quite dry lands, but it will not live through the summer on our driest lands though it is a good winter grower. Liquid manure is a good thing on crops which will stand the labor cost of making and distributing it. The more widely available way is to spread fresh or to scatter in the corral and keep dry and spread at the beginning of the rainy season.—Editor.]

WHAT IS BEING DONE FOR ORANGE DAY.

Strenuous efforts are being made to make March 10th California's greatest Orange Day. The orange crop this year will bring more than \$50,000,000 into California. This about offsets the automobile trade which last year took away more than \$40,000,000 from Southern California alone, and sent that vast sum to Detroit and other Eastern cities.

Thirty railroads are helping tremendously; express companies are placarding their wagons in every city. Every hotel of any size in the United States and Canada will feature the California Orange on its day. The moving picture companies are doing some wonderful stunts to advertise the day. Women's clubs are almost startling with the plans they are developing in every part of the country. Eastern newspapers have promised a great total of publicity. Mayors of thirty Eastern cities have already announced their intention of issuing proclamations in behalf of the day. The outlook is that this California Orange Day will greatly surpass in its scope those of the past, even though former days were so materially successful in clearing up glutted markets and raising and stabilizing prices.

All Californians are urged to promote the idea of sending fruit East in time for California Orange Day; the writing of letters to the East, etc. It is desired to keep public attention fastened on the phrase: "California Orange Day is March 10th," to help promote an event that is profitable to every one who lives in California.

Orange growers about Lindsay are using their cull oranges for fuel, and say when properly dried they make a good fire.

California's Flirtation with King Corn.

(Continued from first page.)

on dark, gravelly, clay-bottom land without irrigation." The grain was used to fatten a large drove of hogs, and in the form of pork the grain was worth 2½c per lb. This was, perhaps, the largest singly-owned corn field in the State, and the first large product of corn-fed pork.

In 1860, G. F. Long, twelve miles east of Visalia, grew barley and wheat, and after harvesting raised corn on the same land with irrigation. In the same district Solomon Jewett "saw ears of corn nine feet from the ground."

On the moist alluvial land at El Monte in 1860, there were "fine farms producing various kinds of grain, the most reliable crop of which is corn."

It is not strange that such demonstrations as these, which we have drawn from records of widely scattered parts of the State, should have aroused the pioneers from their distrust of California as a land of corn, and awakened them to prophecy. Both white and yellow corn was raised here and there, from the upper Sacramento Valley to the southern end of the State, and the results seemed to warrant this exultation, which was written in 1860:

"Indian corn was generally regarded, until the last few years, as entirely unadapted for general cultivation in this State, but this year has demonstrated that throughout the entire length of the State, from San Diego to Siskiyou, there are large districts where it will, with even less attention than on the great central prairies of the Mississippi Valley, attain a height of 14 to 20 feet and yield from 80 to 120 bushels per acre."

Early Recognition of Limitations.—But even while the joyful prophets were thus exalting California above the prairie States, which have since demonstrated themselves to be unapproachable in corn-growing, there were others of deeper sight and clearer discrimination. As opposed to the too broad all-California-for-corn slogan of the writer quoted above, there was in 1858 this truer conception of the facts published: "There is not a doubt but that there are many fine corn-growing districts within the limits of California that are as yet unknown, so far as practical experiment has demonstrated their appropriateness to the culture of the product." Segregation of the fit means, of course, the exclusion of the unfit; and this reached demonstration within a decade, for in 1868 Cronise wrote, in his *Natural Wealth of California*: "Corn can be grown with profit only in favored localities." And this was the truth, not only about corn, but it is an early declaration of the general truth that in a State with such diverse conditions of soil and meteorology as California has, great discrimination has to be exercised in seeking conditions which answer the requirements of any plant. That such wise caution was disregarded in a subsequent effort to boom the corn plant in California, will be noted later.

Two Great Corn Counties.—That suitability for corn depends upon local conditions and not upon geography, is shown by the very interesting fact that for nearly half a century

the two leading corn counties in California were over 500 miles apart. Los Angeles county has stood first in corn for sixty years, excepting two or three dry years. Sonoma was nearly always second until 1899, when she stood first, because Los Angeles was dry. Since 1900 other counties have taken second place as Los Angeles regained leadership, and Sonoma has done less with corn. In 1910 the corn roll of the counties was in this order: Los Angeles, San Diego, Orange, San Joaquin, Tulare, Ventura, Napa, Kings, Inyo, Merced, Sonoma, etc.—these eleven counties producing two-thirds of the crop of the State. The other third is produced in 44 counties—for every county does something with corn except Alpine and Plumas, which are too high, and San Francisco, which finds other skyscraping more profitable. Thus, in a way, all California is in the "corn belt"—which means that nearly everywhere there is some suitable area, and emphasizes the fact, already stated, that suitability is more a matter of local conditions than of geography.

An Early Conception of Corn Requirements.—Though the early demonstrations of success with corn, which we cited as leading to the first booming of it, were on moist land, the Cosumnes river bottom, the Visalia delta, the old lake bottom of El Monte, etc., there was a corn interest in the Russian river valley in Northern Sonoma which was active for several decades as just shown. And there was a man in that valley in 1858 who did some pretty good thinking and graceful talking about corn-growing in California. We do not know his name, but he said in part, this:

"The Russian river makes its way through valley and canyons to the ocean, and the ocean wind, which makes its way inland through this gorge, is so mellowed, softened, and checked in its velocity and power by natural woodland screens, that it does not disturb the upright growth of corn on the broad corn-producing alluviums of the river. At the same time these winds retain to surprising degree the moistening properties they start with from the ocean, which are near to the point of saturation, that the coolness of the nights during the corn-growing season causes nightly dews to fall, which in their copiousness more than equal many a gentle rain shower of other lands."

Of course, the natural philosophy in this declaration is not as good as the poetry, because dew does not fall from anywhere, but forms where you see it—except as it may fall therefrom upon the place beneath. But passing that rather pedantic point, the man made the good observation that when you get moist night air and dew, it is good for corn, both on the leaf and by its drip to shallow root. And this you are apt to get on low, moist bottoms everywhere, and on sandy lands along the south coast, and apt to miss in mid-summer on dry plains and foothill slopes. And you are apt to get it on lower lands near the coast away from river gorges and bottoms—which explains why corn is encouraged and refreshed, both on coast flats and also on interior river bottoms, to which coast winds do not strongly intrude, for all the wind need not go to the ocean

"The Old Lines"

EVERYBODY speaks of them as "the old lines," many perhaps without realizing how thoroughly new and up to date are all these **Champion, Deering, McCormick, Milwaukee, Osborne and Plano** mowers, rakes and tedders. What really good improvement was ever made in haying machines that did not show itself first on one of these machines? Where can you find mowers, rakes, or tedders that need so little adjustment, so few repairs, or that are so easy to repair when they do need it? Nowhere. These old standard machines, known to farmers for three quarters of a century, can still be depended upon to get in all the hay from any field and to make the work light for the farmer.

When you need a mower, rake, or tedder, see the local dealers who handle the **International Harvester** lines. We can remind you here that our machines have always done good work, but the dealer can show you why they still do it. You will find that the local dealer has just the size and style you need. Buy from him.

to wet its whistle. But in its broadest significance the observation of the Russian river pioneer was true—moisture which takes the edge from the aridity of the air is a good thing for corn.

But the plant also depends for thrift upon soil-moisture within easy reach of its rather shallow rooting, and this is covered by another chapter of the Russian river philosophy. For the same man said this:

"The principal features of successful corn culture consist in mellowing the soil to only a moderate depth, say eight or nine inches, and then planting the corn nearly at the bottom of this layer of mellow soil, with only a two or three-inch covering of earth. This secures to the seed certain and sufficient moisture for its germination whilst the after-culture, as the plant progresses, is rendered easy by the gradual working of the soil at each hoeing towards the plant, and yet creating but little hill or ridge; so that, for the most part, the surface of the ground, after a corn crop, is nearly as level as before being plowed."

Though California did not discover the advantage of flat or level culture over "hilling" or "ridging" in moisture retention, the application of the discovery naturally counted for more in this State than in humid regions, and was here more quickly and widely employed than elsewhere. Even with irrigation, thorough flat culture, with a furrow freshly opened and soon closed, gives better thrift than running water in hard channels between sun-baked ridges.

California's Second Corn-Boom.—About fifteen years ago a high functionary from the government farming outfit at Washington rolled over the plains of the Sacramento Valley in a palace car in the month of May. As far as the eye could reach, stretched the carpet of flower-decked verdure, covering the summer-fallow, and through the open window came perfume on the wings of soft, warm air, moistened by the last hay-spoiling shower of the rainy season. And so this mighty farmer, whom the corn-belt loaned for a time to the government, had a vision, and he talked of it afterwards to crowds of boosters, who crowded around him in the towns, and it was in this wise: "Oh, Lord, what fools these Californians be to fallow land which should be busy, and to grow low-down posies when the whole landscape could be a mighty ocean of waving corn. You tell me your farmers say they cannot grow corn on the plains without irrigation? What an idea! To me the whole atmosphere is heavy with corn opportunities. Perhaps you have not found the right variety for your soils. If so, 'my scientists' will make it for you!"

Of course the effect was electrical. All the town boosters, who usually know how to farm better than farmers do, were excited, and resolved to arouse California to corn. An association operating from Sacramento enrolled an army of corn-tries, supplied them with munitions from Washington, made zealous drives for a few years, and succeeded in not adding a bushel to the corn crop of California! This corn-bubble pricked and collapsed itself on the old-time barley stubble of the Sacramento valley plains. Perhaps a little more corn was grown with natural moisture on the river land and other lower lands, where it had been known for half a century to be grand and

JOHN DEERE IMPLEMENTS

BETTER FARM IMPLEMENTS AND HOW TO USE THEM

BOOK FREE 156 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars.

Describes and illustrates Plows for Tractors; Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain

Wagons; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders; Stackers; Rakes; Mowers and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills; Seeders; Grain and Corn Binders.

This book will be sent free to everyone stating what implements he is interested in and asking for Package No. X-152.

JOHN DEERE, MOLINE, ILL.

John Deere No. 999 is accurate. It has the John Deere Natural Cell Fill, Edge Delivery Seed Plate. Surface of hopper bottom and openings to seed cells are oblique, or sloping. Kernels move toward and enter the cells in their natural position. They do not have to be tipped on edge.

Merely move foot lever to change number of kernels per hill.

Drilling distances varied, and change hilling to drilling or back to hilling made easily.

John Deere Corn Planters

Accuracy in a corn planter means uniform drop—number of kernels the same in each and every hill.

If the planter misses only six kernels in every 100 hills, the loss in yield is nearly two bushels per acre.

Accuracy in planting has been the main object in designing John Deere planters. One of the many advantages of using a John Deere planter is that with proper handling it will plant practically 2, 3 or 4 kernels in every hill, as desired.

Van Brunt Grain Drills

Van Brunt Drills are particularly noted for their adjustable gate force feed. Each feed cup plants exactly the same amount. The seed is com-

Van Brunt Drills plant any small seed.

Amount sown per acre easily regulated.

Direct, double, gear drive from the continuous axle.

High-grade discs with bearings guaranteed to last lifetime of drill. Scrapers keep discs clean.

Pressure springs individually adjustable to make uniform depth furrows.

Either single or double discs.

Grass seeder attachment which will drill or sow broadcast can be furnished.

pelled to leave the seed box in even, continuous streams without bunching or choking up. All the ground is seeded.

The Van Brunt Single Disc is the first successful single disc grain drill with closed delivery. The seed is protected by metal seed tubes, disc openers and the disc boots until it reaches the bottom of the furrow.

John Deere Spreader

The Spreader with the Beater on the Axle

Mounting the beater on the axle simplified the construction, eliminated troublesome parts and made possible a successful low-down spreader with big drive wheels. There are no shafts to get out of line, no chains to cause trouble, and no clutches to adjust. The only spreader with beater and beater drive mounted on axle.

Low down, with big drive wheels out of the way. Easy to load. Revolving rake, driven by manure moving toward the beater—no bunching of manure. Ball bearing eccentric apron drive—a new and exclusive driving device. Makes uniform spreading certain.

Widespread attachment for spreading seven feet wide can be furnished for the John Deere Spreader. No chains nor gears. Quickly removed.

New Deere Light Draft Gang Plow

For twenty years the New Deere Gang has had the good opinion of enough farmers to make it the one best seller—

The New Deere Gang is the most widely used plow of its type.

It is light draft, durable and is equipped with John Deere bottoms, known all over the world for superior work, easy scouring and light pulling qualities. It cuts and turns full width of furrow.

A simple, practical foot lift and auxiliary hand lift lever—easy to raise bottoms out of the ground.

John Deere Quick Detachable Shares—great labor and time savers. Share can be taken off easily, only one nut to remove.

And, today, it is the same plow it was twenty years ago, with the usual minor refinements added.

Correct in design, always representing the highest development of the plow-maker's art, the New Deere Gang is a leader, and has been every single year for twenty years.

Go to your John Deere dealer's and look this plow over—you will readily see why it is such a popular plow.

JOHN DEERE, MOLINE, ILLINOIS

ALFALFA

250 lbs. of Mococo Superphosphate per acre will increase the yield of alfalfa enormously. "In some cases the alfalfa growth has been tripled," writes Mr. F. F. Lyons, San Joaquin Co. Farm Adviser. Write for particulars.

prolific. A larger acreage was grown on the plains with irrigation to fill silos, but in real corn, as the corn-belt knows corn, there was nothing doing on dry lands without irrigation—just as the horny-headed old farmers said.

Real Knowledge about California

Corn.—The only broad contribution to real knowledge about corn in this State consists of a pamphlet of 20 pages, published by the University Experiment Station at Berkeley in 1911 as "Circular No. 70," by M. E. Sherwin—from which the pictures on our first page are reproduced. It was a part of the "Cereal Investiga-

Kill Squirrels Gophers

The only exterminator that is 100% efficient and guarantees results or money back is

Used and endorsed by biggest and most successful ranch owners. Prepared waste balls saturated with Kilmol give best results.

New formula of U. S. Gov't Poisoned Barley is effective in dry weather.

WASTE BALLS \$6.00 PER THOUSAND Cheaper than you can make them.

Herbert F. Dugan 1170 Sutter St. San Francisco

tions," begun by the Station about a decade ago and still being pursued. This document can be had free on application, and therefore we need do little but cite it in this connection. Mr. Sherwin found by careful study of the attitude of California farmers toward corn that factors, both natural and economic, influenced their rejection of it as a crop. It is hard to get the labor at the time corn needs much labor in suckering and cultivation; such labor, if secured, costs too much in ratio to the value of the crop; moisture is scant for full growth, or, if available, adds too much to cost by its application; husking is hard and costly, because of the heavier growth of the California plant; in some sections smut has been so bad that the crop has been given up; corn ear-worm and black-birds are almost ruinous in some places; heat is often so intense and dry on the plains that pollen is killed before the silk is ready to receive it, and the grower gets scantily filled or empty cobs; aggressive weeds, like Johnson grass, morning-glory, etc., which like moist low lands just as well as corn does, make cultivation hard and ineffective; local conditions cause suckering to the extent of seriously robbing the main stalks and the ears they try to develop fully; maturing, perhaps due to cool nights, is too late for convenience and great profit.

Some of these things, and probably others like them not enumerated, lessen the interest of the Californian in corn growing even in places where it does its best, and yet it must be granted that there are other considerations which, in individual cases, and sometimes more broadly than that, may make it desirable to keep corn-growing in mind and use it in rotations where conditions admit such practice. In some aspects the corn question becomes, not, can California grow corn—for more than

half a century's experience has shown that she can—but will California grow corn?

No doubt California would now be growing much more Indian corn had not the sorghum group intruded and shown such superior adaptation for conditions which make maize finical—but that is a matter with a most interesting history and interpretation, which may be pursued at another time.

A Long Courtship without Avail.—

Returning now for a moment to the sentimental aspect in which this discussion was taken up, we remark that King Corn has pursued California in what seems to be a losing race—our queen is too fleet to be his queen. In census years California has produced corn as follows:

Year	Bushels
1860	510,708
1870	1,221,222
1880	1,993,325
1890	2,381,270
1900	1,477,093
1910	1,878,000
1915	2,624,000

The greatest crop ever produced in this State is claimed to be that of 1891 with 5,570,000 bushels, but this seems to have been a spurt, the speed of which was quickly lost. Even though the figures cited above may have some aspect of respectability as they appear, by themselves, their relative insignificance is very plain by proper comparisons. The California corn crop of 1915 was only a little more than one hundredth part of that of Illinois, while that of Illinois is but little more than one-tenth of that of the whole country. Roughly speaking, it would take a thousand States with California's liking for the crop to make the corn product of the United States. Truly, then, the goings-on between King Corn and California have been nothing more serious than a flirtation!

Raising Two Tons Milo Per Acre.

[Written for Pacific Rural Press.]

When a man consistently raises two tons per acre of dwarf milo maize on big acreages in Imperial Valley, his methods may be of interest to the average milo raiser who gets only half that. W. W. Cochran is one who has done this for a long time on medium-heavy land, having averaged nearly two tons from 700 acres in 1913; having raised two tons threshed per acre one year and 2½ tons in the head another.

"It costs the first ton to raise it," says he, "and all over that is to the good." He gives credit for his success to J. J. Strieby, a pioneer milo grower of the Valley, whose advice he has followed successfully. The principal feature is the seed-bed preparation. Only one crop of milo per year is grown, though others plant early, cut one crop, let it grow up, and harvest another crop the same season. Mr. Cochran has tried this; but says that the first crop especially cannot fill out properly because it is heading in hot weather, and the second crop is too late in the season to fill out right. Often a cold north wind crusts the ground after planting the first crop and a poor stand results.

The ground is plowed in June; is then flooded so there will be plenty

of moisture to bring the corn three or four inches tall; then disked and cross-harrowed; then "floated" down with a heavy "smoocher" or clod crusher; and planted.

"More poor stands are due to poor planting than people think," says Mr. Cochran. People plant an inch or 1½ inches deep, then flood. The silt cakes, so only part of the corn gets through, and the ground dries down to it before it can all come up anyway. He has never been successful in irrigating after planting.

As he does it, the seed is planted about July 1, three inches deep in the moistened earth, and it comes up quickly so weeds do not get ahead of it. Three or four pounds of seed are planted per acre with a two-row corn planter. Water is run through a furrow made in each center about when the corn is 4 inches tall. Two or three deep cultivations are given; and one more irrigation, not over a month later, finishes work till harvest; for by the time of the second irrigation it is shading the ground well. It is desired that the kernels begin to fill about September 1 after the hottest weather is past.

Throughout the valley, according to Mr. Cochran, Hindus harvest the milo, cutting the heads off with

knives at a cost last year of \$3 per acre, though previously it had been \$2.50.

The stalks are fed down in the field. Animals ordinarily eat stalks and all unless frosted or too coarse. The beauty of milo stalks is that they are slender and enjoyed by stock.

IMPROVED EGYPTIAN COTTON.

[Written for Pacific Rural Press.]

Instead of paying attention to maintenance and improvement of the staple of cotton, the New England mills have spent their money for machinery to use shorter and poorer grades; and thus American cotton has deteriorated since the Civil War, says W. E. Wilsie, a pioneer grower of cotton in Imperial Valley. That is why five years ago the largest importer of Egyptian cotton into U. S. told Mr. Wilsie that the Egyptian cotton produced in Southwestern U. S. was too good to be manufactured in U. S.

However, the Goodyear tire people want a long staple cotton for the fabric in their tires, according to Mr. Wilsie, and are starting to grow it on a large scale. In such a case, they will probably put in special spindles and machinery to handle it; and probably a greater market will be provided in U. S. for this variety.

About 1908, E. W. Hudson in Arizona began to select from the so-called "Yuma strain" of Egyptian cotton which had been brought to produce 1½-inch staple. He is now getting 1¾-inch staple from the same variety, which is called "Pima cotton" from the name of the reservation on which it was produced. More attention to seed selection would increase the yield and staple of our cotton and thus increase its value.

PROFITABLE STRING BEANS.

[Written for Pacific Rural Press.]

A quarter-acre of Canadian Wonder string beans yielded \$300 net f. o. b. the ranch after shook was paid last spring for C. E. Longaker of Coachella Valley. They had been planted Jan. 18; and the first shipment came 90 days later, selling at 30 cents per pound. The price increased two or three cents for a few days, then went down slowly. This season, he planted Feb. 1 because the season has been colder. Rows were planted on ridges, about 20 to 24 inches apart, using 25 pounds of seed on the quarter-acre.

Irrigations came once per week after the beans were up, never letting the water reach the plants except by soaking upward between the furrows. The soil is sandy, so it could be worked shortly after the water was off.

These beans kept well on the vines and matured through a shipping period of six weeks, being picked alternate days.

The Ranchers' Market of San Diego county now has 81 members who ship vegetables and fruit through their organization from the interior and coast valleys. Most of the produce is shipped from San Diego by steamer all along the west coast.

10-20 Model J
Burns Kerosene

\$1095⁰⁰
F.O.B.
SANDUSKY.

THIS 10-20 Model J Sandusky Tractor places the farmer with lesser acreage on the same basis of economy as the man with the larger farm.

Gives him proportionately the same dependable service, produces the same results in dollars and cents and effects the same economies of labor as secured by the hundreds of farmers operating our 15-35 Model E.

Pound for pound the Model J is as good a tractor as our larger machine. It is designed on sound engineering principles, built with the same mechanical precision, of the best materials and proved out thoroughly in actual field work.

It is sold strictly on a guaranteed basis, after an actual demonstration *on your farm* has shown that it is profitably adapted to your needs and capable of doing your work.

You buy tractor certainty when you buy a Sandusky, and you get it at a reasonable price.

BRIEF SPECIFICATIONS

Our own four-cylinder, four-cycle, $4\frac{1}{2} \times 5\frac{1}{2}$ motor; drop forged crank-shaft, cam-shaft and connecting rods, interchangeable high grade bearings; combination force feed and splash oiling system; high tension magneto; Bennett air cleaner; belt pulley; three speed transmission; Timken worm and gear drive; Hyatt equipped; universal couplings between motor, transmission and differential; three-point spring suspension; thorough protection against grit; full steel construction; short turning brakes. Weight, 4000 pounds; wheel base, 76 inches; height, 52 inches.

BOOK J-133 FREE

It describes fully the unique principles of design, the construction and performance of this smaller "Little Fellow With the Big Pull." Also gives the details of our "Try It Before You Buy" sales policy, as well as covering our broad, binding guarantees. Tell us your problems, and we will gladly assist you in solving them without obligation on your part. Be sure to ask for Book J-133

A NEW PLAN—FREE SERVICE

We announce an entirely new departure in tractor selling. A coupon book good for 100 hours of service goes with every Model J. This means expert service and help without charge when you want it. See catalog for details.

If your work requires more power than furnished by Model J let us send you catalog covering our 15-35 Model. Ask for book E-133

TO DEALERS—We want men of standing, with pep and energy, to get behind this 10-20 Model J and push it. Write for our proposition.

THE SANDUSKY TRACTOR

"THE LITTLE FELLOW WITH THE BIG PULL"

General Agricultural Review.

FIELD CROPS.

The honey crop of Monterey county was valued at \$125,000 during 1916. An increase of 25 per cent in the number of colonies established is reported.

It is reported from Tulare that Leland C. Rausch of Redlands has bought 332 acres of land in the Pixley district and will plant it to rice this season. New buildings to cost upwards of \$4,000 will go up.

The asparagus shipping season started in Imperial county last week and will increase in size rapidly during the next few weeks. Lettuce shipments to Eastern points are also being made.

Canners are said to have representatives in the Gridley district of Butte county trying to contract for tomatoes. The cannery there will be operated the coming season if the acreage warrants.

News comes from Oxnard that local bean brokers there are receiving inquiries for two-week options on large quantities of lima beans. A number of future contracts have been written by growers for next season's limas at \$6.60 to \$6.80.

A report from Stanislaus county says that while good rice crops were the rule in that county last year it does not seem probable that the industry will become an important one there unless at a much better price than the present.

News comes from Tulare that C. W. Gates of Los Angeles has put \$100,000 in development work on 23,000 acres of land southeast of the Tulare Lake bed and will sow to wheat. Machines are now busy building levees as protection from high water.

A most complete and unbiased statement of climatic and soil conditions in Imperial county and crops adapted to that section is contained in a bulletin of the University of California written by W. E. Packard, who has charge of the Imperial Valley Experimental Station. It is just off the press.

Because hops are selling at 66 cents a pound in England and the crop is about exhausted, together with a big decrease in acreage in all Pacific Coast States, Harry Fraser, organizer of the Cal. Associated Hop Growers, expects record prices for the 1917 crop. He states that 38,000 bales of the 50,000 needed to complete the organization have already been signed up in the Sacramento Valley.

DECIDUOUS FRUITS.

September 13 and 14 have been set aside as the dates for the holding of the Arbuckle Almond Fair this year.

The California Peach Growers, Inc. have advised brokers that there will be no decline in peaches during February or March.

The Robert Marsh Co. are reported to be planting 500 acres of land near Perris, Riverside county, to apricot and pear trees this spring.

McKillop Bros., who recently purchased the Frank Dorn ranch in San Benito county, are planting 100 acres of prune trees and a like amount of apricots.

Dr. L. H. Bailey, dean of the College of Agriculture of Cornell University, left Los Angeles for Japan and China last week where he will study the flora of those countries.

According to the January report of County Horticultural Commissioner Fred K. Howard of Kings county there were 160,000 trees and plants shipped into Kings county during that month.

The supervisors of El Dorado county have notified County Horticultural Commissioner John E. Hassler that after March 1, that office will be vacant. It is said that action was taken to reduce county expenses.

In the annual report of the officers of the Sebastopol Apple Growers' Union, Inc., held at Sebastopol last week, 1916 was shown to have been the most successful year in the history of the organization. The old directors were re-elected.

After a conference with Southern California horticultural commissioners, State Horticultural Commissioner Geo. H. Hecke announced last week that the next State Fruit Growers' Convention will be held in Riverside sometime early in June.

J. F. Niswander, vice-president and general manager of the Cal. Peach Growers, Inc., reports that packers are already endeavoring to contract with the association for the 1917 crop. No orders will be taken subject to the opening price as was done last year.

Report has it that D. C. McCallum of Butte county has found an old pear tree that is not bothered with either blight or frost and that it is a regular bearer of fine fruit. He has grafted over 250 nursery trees on wild pear roots and will experiment as to the commercial aspects of the variety.

County Horticultural Commissioner C. K. Turner of Placer county says in his annual report for 1916 that there were 3314 cars of decidu-

ous fruit shipped from that county during the year. Of this amount there were 13,992 tons of green peaches, 10,778 tons of plums, and 8,712 1/2 tons of pears.

Tulare county reports the following crops for last year: Peaches, 16,100 tons; prunes, 5,000 tons; apricots, 30 tons; almonds 10 tons; sugar beets, 28,320 tons; pears, 80 tons; plums, 1600 tons; grapefruits, 80 tons; lemons, 400 cars; and oranges, 5,300 cars.

CITRUS AND SEMI-TROPICAL.

Sample Costs

A dollar and cents argument for the YUBA

Some records chosen at random

1 There is no mystery about the upkeep costs of the Yuba. Costs vary just as the length of the season, soils and drivers vary.

2 Mr. Wesner says, "Earned \$4500 in two years. Total cost of upkeep was \$225."

3 Davis and Son report, "The year's cost for repairs was less than \$5.00."

4 Geo. S. Wheeler, a contractor, gives an average daily operating cost of \$9.56 (including engineer's time) for 16 months' work. His gross daily income was \$20.54.

5 Mr. Thomas Couch of Montana has taken care of 700 acres for two years and has used about \$40 worth of repairs.

6 Costa and Silva didn't even have to repair a spark plug at the end of thirteen months' hard work.

7 Practically no upkeep cost the first season. Thereafter it varies from \$10 to \$500 per season, depending on the amount of work done.

8 The Yuba owner is protected against an unreasonable upkeep cost. The right materials and low repair prices are the reasons.

REASONS WHY THE Waterloo Boy DISTILLATE TRACTOR is the best proposition.

It is a Three Plow Tractor, the right size and power for orchard and field work. Embodies the experience of 20 years of engine building. Economical in operation, using about 15 gallons distillate for 10 hours' work. Sells at a low price—the best Tractor buy.

Walnuts are Dollars

Plant a Walnut Grove, which will grow into dollars while you sleep. The Vrooman Franquette bears in three years and sells for 20c a pound—is smaller than an apple and sells for more money. Get in with the tide and get rich. At forty feet apart, it only takes 28 trees to the acre. A full-bearing orchard will crop you \$1500 to the acre. True Vrooman Franquette Walnut Trees grafted on California Black Walnut Roots at

**MIRA MONTE
NURSERY**
San Jose, Cal.

Lindsay district of Tulare county has been completed for this season, according to reports from that place.

It is said that while the shipments of oranges from the Pomona district are going East rather slowly the returns to ranchers at this time reach about \$6,000 per day.

Well rigs are being erected for the development of deep wells in the Terra Bella Irrigation District which will supply water for 10,000 acres of citrus fruit land in that section.

Smudge pots have been used extensively in the Tulare county Valencia orchards during the recent cold weather, according to reports, and much fruit has been saved as a result.

Three years ago, five acres of C. D. Baker's orange orchard in eastern Los Angeles county was badly mottled. The mottling is all gone now, and Mr. Baker believes the improvement is due to 5 tons per acre of sugar beet lime.

Disking the cover crop lightly to preserve moisture till plowing time, is being practiced by Ralph McNees of Los Angeles county. The disking leaves much of the cover crop still growing, which he hopes will hold the soil in case of floods like those of last spring.

It is announced from Upland that the Lemon Heights Citrus Association has just been organized by thirty-one lemon growers who control about 400 acres of the best citrus property in the district. The association will be a member of the California Fruit Growers' Exchange.

VINES AND VINEYARDS.

A considerable acreage is being planted to Emperor grapes in the Woodlake district of Tulare county as a result of satisfactory yields and prices recently.

The strike issue between vineyardists of Fresno county and vine pruners is still unsettled, the strikers demanding higher wages and shorter days, which the vineyardists refuse to concede.

An experiment is being conducted by Geo. H. Reynolds of Orosi with Zante currants. Vines that he planted last year put on a good growth, but the size of the crop cannot be ascertained till the third year.

Because, it is claimed, the Cal. Wine Association refused to accept delivery of their grapes in 1915 at a contract price agreed upon, twenty growers in Fresno county have sued the wine company for a total of \$6,740 damages.

Because some vines affected with phylloxera in Fresno county are being dug up and sold for fire wood, this dreaded disease is being spread among vineyards of Fresno county, according to Horticultural Commissioner Fred P. Roullard, who states that he will prosecute all offenders in the future.

DEATH OF PROF. STUBENRAUCH.

The College of Agriculture at Berkeley is plunged into mourning this week by the death of Arnold V. Stubenrauch, professor of pomology, which occurred after a brief illness on the evening of February 12. Our readers throughout the State, who widely know him for his work in fruit lines, will be pained to hear of the early ending of his career, in the course of which he did much good work which will long be influential. Prof. Stubenrauch was still in middle life, grown and educated in California, and a graduate of the State University. He served in several capacities under Prof. Hilgard, who leaned upon him confidently and esteemed him very highly. He was then occupied for several years as associate of G. Harold Powell in his fruit work for the Bureau of Plant Industry and succeeded Mr. Powell in that line, pursuing several investigations into handling grapes, apples and small fruits in storage and shipment from the Pacific Coast. During the last three he has been at the head of instruction and research in deciduous fruit lines in the University, man-

festing great mastery and devotion in his work, and his death is a serious loss to the State.

KEEPING BIRDS OUT OF VEGETABLE GARDEN.

Orange county vegetable growers keep birds away quite effectively by setting lath stakes two or three feet

tall about the gardens and tying white strips of cloth about a foot long at their tops to flutter in the wind. Some run a cord from stake to stake along every eighth or ninth row and tie the streamers to them. The cords are run crosswise of the prevailing wind so the cloths will not wrap around them so much.

Does The Work of Six Horses

---and saves you money!

BEAN TrackPULL Six Horse Tractor

Find out about this wonderful little tractor now—before you start another season's work. The BEAN TrackPULL Six Horse Tractor weighs only 2800 pounds—so light that it does not pack the softest soil. It will pull any load six horses can pull all day long and costs no more to keep and work than two horses. And the BEAN TrackPULL Tractor will work 24 hours a day if you say so. Here is powerful traction for every use at a low cost. The price is \$975—little more than you spend to keep six horses for a year. There is no other track-laying orchard tractor made for less than \$1800. Now see what it will do for you.

Orchard Work

In an orchard or citrus grove this tractor will work under tree boughs only four feet off the ground, and closer to the trees than horses can go. It is especially adapted for cultivating and works hour after hour without a stop. A boy can operate it with a little practice. The BEAN TrackPULL Tractor "gee's" and "haws" just like a team of horses, and delivers as much power on the turn as when pulling straight.

The 10 Foot Turn

This wonderful little tractor is so compact that it will turn completely around in a circle 10 feet across. Because it can make such a short turn, it gets into corners just as well or better than a team can. The motor is a simple four-cylinder automobile type, but built for heavy duty. Controlled by a friction clutch driving four big gears. It has a pulley for stationary work. The fenders and wheel flanges can be removed for running on boulevards.

No Other Tractor Like This

No other tractor now does or ever did what the BEAN TrackPULL Tractor does. No other tractor with such advantages was ever sold at such a low price. It is fully patented. There will be no other tractor like it. The demand for these tractors is growing daily. Wide-awake farmers and growers are realizing the value of the BEAN TrackPULL Tractor.

We Guarantee Prompt Deliveries in April

Our factory has been working night and day, but we cannot supply the demand. We are now enlarging our plant and increasing our facilities and by April will be able to handle deliveries promptly.

If you are interested, don't delay.

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

SUCCESSFUL TESTS OF CITRUS TRACTOR.

[Written for Pacific Rural Press.]

A new orchard tractor (new in California) has been going through its paces in Southern California for the past few weeks. It is the baby of the Avery family—10 h.p. on the belt and guaranteed to do whatever four horses can, but costing only the price of two good ones. We saw it Feb. 10 in the J. W. Cox lemon orchard not far from Whittier. The demonstration had been locally advertised; and when we arrived at 3:30 there were some 14 automobiles besides other rigs lined up along the road; while their occupants were scattered among the young trees where the tractor had been plowing since one o'clock with a two-bottom disk plow. The ground had been disked by team, leaving it covered with clods half the size of a derby hat. That was poor condition to leave it in, and the tractor wasn't leaving it that way. It was turning up mellow moist earth and laying it over as smoothly as most people plow soft land; though the driver, Roscoe

base is 109 inches and the width over all is 45 inches, while it is only about three feet high at the highest point. The two front wheels are about 16 inches apart. Her next larger sister, an 8-16, is very little taller or broader. The baby weighs 2300 pounds.

LOCATING WELL ON LOW GROUND.

To the Editor: Will you please tell me whether it would be possible and practicable to irrigate an orchard of 20 acres that has a ditch across one end 40 rods long, with a fall of one foot in the 40 rods, by pumping into the lower end instead of the high end? The ditch is an open ditch, and has walls amply high to take care of the extra foot of water. I wish to locate the well at the lower end if possible on account of irrigating near-by alfalfa which would have to be irrigated by pumping the water across a lateral which we do not own and will have to go either over or under.—C. A. S., Pasadena.

[Answered by Prof. S. H. Beckett, University of California.]

In overcoming the one-foot grade in 660 feet, at least .5 of a foot additional must be added to give suf-

This little orchard tractor pulls 6-foot double disks easily over newly plowed ground.

Anthony, admitted absolute lack of plow-knowledge, and not much of tractor knowledge.

From beginning to end, the little four-cylinder engine responded to every touch of the driver. She pulled the plows down and up across a ravine with 40-degree slopes, though with not quite so deep a furrow as the full six inches she turned on the level. Only when the grade grew so steep that fuel would not run from tank to carburetor (which is at least a foot lower than the bottom of the tank) did she begin to balk. Roscoe gave the tank all the compressed air he had, and that forced enough gas out to get the machine and plows up the hill. Running along a side hill, so much traction devolved onto one wheel that the upper one had to be held down by loading that side with a man or two extra. On the turns, one center was skipped each time. Otherwise everything went beautifully. At the end, the tractor was backed up a couple of planks onto a truck to be taken back to town to be used in other demonstrations.

About the Tractor.—This little engine has four 3-inch cylinders of 4-inch stroke and burns distillate or gasoline with proper adjustments. The friction drive keeps the wheels going even when the tractor is hitched to a walnut tree. The wheel

ficient grade to carry the water in the ditch. This will mean that the ditch at the lower corner will have to be built up at least 1½ feet above the elevation of the highest corner to be irrigated. Whether or not this is good practice depends mainly upon the soil type. In light loam, gravelly, or sandy soils, ditches built above the adjacent land level are a continuous source of annoyance; while if built in more impervious soils, such ditches may be operated successfully. Even under the best condition, ditches which are built above the adjacent land level are in the long run unsatisfactory and sooner or later are replaced by the elevated flume or the underground pipe line.

If the high corner of the alfalfa field to which you refer is at a lower elevation than the adjacent corner of the orchard, by means of an inverted siphon the water may be taken under the lateral referred to. The pumping plant may then be placed in the high corner of the orchard.

CULTIVATE BERMUDA SOD BEFORE PLOWING.

[Written for Pacific Rural Press.]

A stubborn sod of Bermuda grass had overrun a ten-acre field now being worked by Frank Van der Poel of Imperial county. Mr. Van der Poel says that when you try to plow Bermuda sod, it is next to impossible to plow it shallow or to regulate the depth at all. The plow always wants to go deeper.

To make the plowing easy, he had hitched a 10-tooth cultivator to his 8-16 tractor and was tearing around the field in fine shape, lapping the cultivated strip half its width on every round. He did the same thing crosswise, but deeper still. Thus the sod was torn to small pieces so that it would plow easy right away. This cultivator is used ahead of all plowing, not only for the sod, but also to break up clods so the dirt turned under will be fine. He did it that way last July and August on 30 acres, and plowed it 10 or 12 inches deep. This does not kill the grass, but puts the ground in far better shape for crops.

WORDS WITHOUT POWER.

On a recent rainy day four hunters went out from Macon, Mo., to shoot squirrels and rabbits. They were in a good car—that is, a good car for dry weather. In the bottoms the car sank to its axles and balked. A consultation of war was held and Charley Weisenborn, one of the party, volunteered to bring to the rescue a span of Missouri mules. He said he knew a farmer in the vicinity and that he would go to him for aid. Presently Charley appeared with the farmer and two large mules. Ahead of the bottoms was a long and steep hill.

"We want you to get us out of this," explained Charley, "and then help us to the top of the hill."

"Who's them fellows you got with you?" the farmer asked.

"Oh, that fellow without a mustache is Walter Hunter. That serious looking man over there is Earl Edwards—runs a store in Macon. The dignified gentleman with his hands in his overcoat pockets is the Rev. G. B. Smith of the Methodist Church."

"A preacher?"

"Yes, pastor of the church."

The farmer shrugged his shoulders and turned away.

"It's no use, Charley," he said; "those mules would never yank the car out of the mud under the influence of language that a preacher would stand for."

The extra tire which every autoist should carry with him should be used to replace one of the service tires at regular intervals. The tire removed should then be gone over and put in condition. The spare tire should always have the paper in which it is packed or a tire jacket on it.

The most effective safety device known is a careful man. Get the "Safety First" habit.

Don't let your steering rod connection loosen up so that your wheels wobble.

Lock Seamed and Soldered

There is a tremendous difference in surface pipe. This is appreciated most by the man who has wasted time and money on inferior makes. If you want absolutely the strongest and best surface pipe you can buy, select

Madewell Surface Pipe

It has many distinctive important advantages you can't afford to overlook.

The Madewell Long Lock Seam is made doubly sure and strong by soldering the entire length. A better seam can't be made. The Madewell Lock Seam Sleeve—used in Madewell pipe only—is decidedly stronger and smoother than the old fashioned lap and riveted seam used in other pipe. This feature alone puts Madewell Pipe in a class by itself.

Send for Free Booklet—which tells just how Madewell Pipe is constructed

Milk Producers Likely to Organize.

[Written for Pacific Rural Press.]

The big problem of dairymen furnishing whole milk for city trade is to get a market in spring for the surplus "green-grass" milk. In San Diego county as explained by Farm Adviser H. A. Weinland, an effort is being made to solve the problem systematically.

Certain milk producers supply the city distributors regularly the year around. Others supply them during the scarce season only. Others retail their own milk. Often the grocers handle milk at cost for convenience of their patrons. With the last three classes unorganized in connection with the other two, there is difficulty keeping the price to producers up to the cost of production. The latter is figured at 20 to 23 cents per gallon here, according to Mr. Weinland. The "gentlemen's agreement" retail price is 11 cents per quart and 6 cents per pint now in mid-January.

When the extra flow comes with the spring grass, the dairymen who sell to distributors during scarce seasons only, must find another market for their entire product. They find it profitable to cut the retail prices of the distributors, rather than sell to butter factories. This reduces the margin on which the regular distributors operate and often causes a loss, because their regular producers get a contract price. This loss must be replaced by making a

wider margin between producers' and consumers' prices.

If all five classes mentioned above as being concerned in the milk supply of San Diego were organized, the milk graded and sold according to fat content, pooling it as occasion should show best, and sold only to those distributors who would retail it at a price not exorbitant to consumers, but yielding a living profit to the producers, the problem would be solved. The retail prices and the producers' prices could be varied to suit the season; for the plentiful spring milk is produced cheaper per gallon than when feed is scarce. The distributors could operate on a fixed margin per gallon and could expand their profits by expanding consumption. They would be protected against loss due to independent retailers cutting under; and when a surplus must be sold to butter factories, the lesser profits would be prorated to everybody. The distributors could pay a higher price to producers without raising the price to consumers; because they would be protected against the losses due to under-cutting. Producers would all be assured of the maximum prices consistent with big consumption.

There is hope that, with the aid of State Market Director Weinstock, the organization may be ready to handle the next spring's milk.

Milk Cool on a Long Haul.

The objection to hauling milk daily 37 miles to San Diego from San Pasqual Valley by auto-truck was that it would arrive in bad condition, especially in summer time. But E. H. Webb thought he could do it and began two years ago to haul his own and neighbors' milk. Now this milk is considered about the best received

by San Diego, and so appreciated.

A few cans of soured milk were encountered the first year, but their causes were found and remedied. The milk is hauled in 10-gallon cans, of which two sets are now kept so that one set can be put out in the sun alternate days, after cleaning and sterilizing them. Two cans had been found sour because the caps were not off during the day at home, so lids are always removed during that period. Flies do not enter clean cans set in the wind and sun in a clean place. Hot cans are uncomfortable and clean cans offer no inducement to flies, anyway.

The Principal Cause of sour milk was that it was not cooled and kept cool; for no ice is available for this purpose. But Mr. Webb and his sons worked out a system which has proved satisfactory. A 300-gallon tank is pumped full of water. Grain sacking is hung over the edge of the tank all around the outside with about one foot hanging in the water. The sacking acts as a wick, drawing water to the outside, where it evaporates in sun and wind and cools the water in the tank. This water is piped down hill to the regular milk cooling machine at the barn.

To keep the milk cool on the road, each can is covered with a wet bar-

ley sack; and a sheet made of grain sacks is sometimes thrown over the whole load. A few bucketfuls of

water on this sheet about twice on the four-hour trip keeps the milk cool except in extreme weather.

SHARPLES

SUCTION-FEED PATENT

and what it means to you dairymen

The new SHARPLES patent, one of the broadest process patents ever obtained, covers any separator that will *skim clean at all speeds*. It covers the *process* of varying the feed in proportion to the centrifugal (separating) force. No one else can, for 17 years, make and sell such a separator.

You know of the tremendous losses caused by all fixed-feed separators because they are never turned full speed. More than 4,000 investigations *proved* that 19 out of 20 operators turn their separators *below* speed most of the time. Purdue Experiment Station Bulletin No. 116 *proves* that the loss from slow turning amounts to from 7 to 13 lbs. of butter per cow per year—or the appalling loss of 80,000,000 lbs. of butter yearly in America alone!

Skims Clean at Any Speed

So we realized that it was far from sufficient that a separator *could* skim clean when properly handled. It was vitally necessary that it *would* skim clean—even when improperly handled. That's SHARPLES, which sucks in just as much milk as the centrifugal force can perfectly handle—and *no more*. The result is *clean* skim at all speeds and *unchanging* thickness of cream.

All separator makers *know* of this tremendous loss and some *admit* it in their advertisements. They *cannot* stop the loss (because SHARPLES basic patent covers any separator that will skim clean at all speeds) so they try to *warn* against it by putting on a sight speed indicator (on which the operator's eyes must be glued every moment and his muscle must respond instantly to the indicator's *prod* for more speed)—or a bell indicator (which, like the fire alarm, gives notice of damage only *after* it is done). All such devices have proven *failures*, time after time, because few operators can stand being prodded or yelled at whenever the speed slackens.

A bell ringing device is truly an acknowledgement of the vast *superiority* of SHARPLES which automatically *prevents* all losses from uneven turning instead of simply announcing them.

Simple Tubular Bowl—No Discs

Not a single piece is added to accomplish the wonderful "Suction-feed." And the SHARPLES was *already* by far the *simplest* and easiest to clean. We realized that it was not enough that a separator *could* be kept clean—it must be so simple that it *would* be kept clean. So the *patented* SHARPLES Tubular Bowl contains *no discs* or blades—it is just a plain, light, steel tube. No other separator can use it.

All other separators must contain discs or blades to skim at all. Their makers wrangle between them as to how many discs, and if curved or straight, and how the milk should be fed into them. They constantly change their designs without getting nearer the *ideal*. Some use more discs, many of them boast of using less. Such boasts plainly acknowledge that "the fewer discs the better."

The *ideal* is SHARPLES which has *no discs at all*. But this ideal is a SHARPLES patent.

Important to Dairymen

So all SHARPLES patents assure you, as a SHARPLES user, of *larger* profits and *greater* convenience than the other man gets. The knee-low supply tank, single ball bearing in oil, slow and easy crank speed, freedom from the tyranny of fixed speed, increasable capacity, easiest cleaning, automatic oiling without oil cups or oil holes—all these are *your* advantages *exclusively*, because they are exclusive SHARPLES features.

Send for catalog, which explains all this, addressing Dept. 31.

[Written for Pacific Rural Press.]

Three heifers are doing outstanding things at the Whittier State School. Windsor Milk Maid Segis, born May 10, 1913, freshened Nov. 5, 1916, and produced 566.1 pounds milk from which 26.04 pounds butter was made. They have two heifer calves from this cow sired by King Segis De Kol Mead, son of De Kol of Valley Mead, the world record and three times State grand champion Holstein cow. Another heifer, Whittier Ormsby Hartog, born July 5, 1914, freshened Dec. 8, 1916, made a record of 334.7 pounds milk and 17.388 pounds butter and having an average test of 4.15 per cent fat in the milk. She is a daughter of Mutual Ormsby De

Kol, and a granddaughter of King of the Pontiacs. Her record is better than the one made by Windsor Milk Maid Segis at her age (14.87) and her individuality is as good. The first mentioned record above is very near the State record of 27.86 pounds which still holds, though made three and a half years ago by A. W. Morris & Sons' Natula Fobes 2nd. Another heifer, Whittier De Kol Netherland, freshened Jan. 29 as a junior two-year-old and is being tested for 30 days, because near the end of her first week's test she was increasing both milk and fat. On Feb. 7 she made 2.37 pounds butter; and on Feb. 8 she made three pounds. These are excellent records.

Is Hay Chopping Advisable?

To the Editor: I would be very glad if you would give me information as to the benefits of chopping up dry hay, which would be mixed with alfalfa, oats and barley, for use in a dairy. I am told that from two to two and a half tons of chopped hay can be stored in a barn where one ton of loose hay can. If you can tell me whether there is much advantage so far as saving in feed and securing extra food value out of the feed I would be greatly obliged.—H. M. B., Santa Clara.

It is commonly estimated by those who store their hay in chopped form that about three tons of chopped hay can be stored in the same space required for one ton of loose hay. As a precautionary measure, though, you should either have a strongly braced barn or put in additional braces, as there is much more pressure against the sidewalls with chopped hay than loose hay. Sometimes we have seen it stacked inside the barn about a foot from the wall

to overcome this condition. Chopping hay does not increase the feeding value of hay, but practical feeders claim that 15 to 20 per cent of the hay is saved by chopping, owing to the relatively small amount wasted as compared with loose hay feeding. In your location it would probably be advisable to stack the hay before chopping, but in the interior valleys it may be hauled direct from the field to the cutter, providing it is left in the shock till pretty thoroughly dried out. Otherwise there is danger of spontaneous combustion.—Eds.

Silage is similar to grass in value. Therefore, winter feeding more nearly approaches June feeding.

If the crop is allowed to get ripe or dry out in any way, it does not pack well, and is almost certain to produce moldy silage.

Save Your First Crop of Alfalfa

California ranchers who get busy quick will save thousands of dollars! A silo will save your first crop of alfalfa, usually made worthless for hay on account of the large quantities of foxtail and other weeds.

INDIANA SILO

Have you been depending like a lot of others, on hay and other high-priced feed to keep your cows sleek this Winter? With feed bills going higher and cream checks smaller, don't you wish that Indiana Silo was erected last summer?

Early Buyer's Discount

Don't delay—mail the Coupon above, or write at once. We are now making up carload shipments to California. Get our Early Buyer's Discount. Buy on easy payments, if you wish, and pay out of the profits. But act quick—NOW—and save that first alfalfa crop.

Here is the heart of THE NEW DE LAVAL CREAM SEPARATOR

THIS is the new self-centering De Laval bowl with detached spindle, that is creating such a sensation in the dairy world.

This new De Laval bowl, with patented tangential tubular milk passages and patented removable milk conveyor, makes possible in a bowl of given size and weight, operated at a given speed, greater skimming efficiency and capacity than has ever before been attained in any other cream separator bowl.

These are big advantages that you can secure only in the De Laval.

But aside from the big advantages of greater capacity and closer skimming, there are many other important improvements in the New De Laval.

All discs are now interchangeable and are unnumbered. There are fewer discs. On account of greater simplicity of bowl construction, the New De Laval is easier to wash and, capacity considered, is still easier to run than before. High grade construction and design, together with perfect automatic lubrication, are a guarantee that the splendid De Laval record for durability will be maintained in the new style machine.

Every New De Laval is now equipped with a Bell Speed-Indicator, the "Warning Signal" which insures proper speed and uniform cream.

If you are trying to get along without a cream separator or with a half-worn-out or unreliable machine, why not get a NEW De Laval NOW and stop your cream waste? You don't need to count the cost, because the De Laval will soon pay for itself.

There is a De Laval agent near you who will be glad to explain all the improvements and advantages of the NEW De Laval, and who will set and start a machine for you on your farm and let you try it for yourself.

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for any desired information.

New Catalog will be mailed upon request

PACIFIC RURAL PRESS, S. F.

Possibilities of Alfalfa-Finished Beef.

[Written for Pacific Rural Press.]

Many alfalfa growers have looked forward to the time when some practicable way of finishing beef steers on alfalfa lands would be fully demonstrated in the interior valleys of California on the theory that such practice might furnish a safe and sure market for alfalfa hay on farms owned by those who do not care to maintain dairy herds.

That practicable methods of feeding beef steers on alfalfa lands may be evolved, but that the beef steer will never invade the alfalfa farm of 80 acres or less, is the view of W. E. Premo, manager of the Porterville Alfalfa Co. in Tulare county, who has handled several hundred head of beef steers on alfalfa land each winter for the past three years.

Mr. Premo's reasons for these beliefs are that the 80-acre alfalfa grower can handle dairy cows and hogs more profitably than he could feeder cattle and with less speculation, also because the smaller operator would encounter an almost prohibitive cost of feeder buying. Even the larger buyer runs against this objection, but is able to overcome it in a measure by being able to stand a bigger overhead expense in finding the stock.

But the large operator's path is by no means a rosy one as yet, because of the following reasons: ordinarily he does not receive a big enough spread in market quotations between November, when the cattle are put into the feed lots, and February or March when he sells them (the gain in weight is not sufficient to offset expense of feed and labor, a spread of at least one and a half cents a pound on the average being necessary to insure profits); he is

handicapped at times by heavy rainfall in a comparatively short length of time, causing muddy corrals and a consequent reduction in gain per steer per day; buyers do not pay sufficient premium for well-finished steers, although this latter is under way of improvement, according to Mr. Premo.

Notwithstanding these difficulties, Mr. Premo's three years' feeding has been satisfactory from a financial standpoint, for while his alfalfa only brought him \$3 a ton one year when the spring price for steers was less than the fall price, he estimates that his hay will net him \$25 a ton for the past season.

The equipment investment under which Mr. Premo operates is relatively small, consisting of corrals, feed and water troughs, hay chopper and feed wagons and teams.

The feed ration is made up of about 22 pounds chopped alfalfa hay and eight pounds of cocoanut meal and cottonseed cake per day per steer. The advantages of feeding chopped hay are many, according to Mr. Premo, for there is not only a direct saving in waste, but it can be handled about twice as cheaply as loose hay in feeding. Heretofore it has been chopped as used, but it would be practicable to cut and stack in the field direct from the shock, if allowed to dry out fairly well, and this may be practiced in the future.

As the matter of profits lies largely with the kind of cattle one has to feed, Mr. Premo spends a good deal of time and money in selecting them. The 1900 that were fed out by him the past season were mostly twos and threes of Hereford and Shorthorn breeding, secured in Oregon.

Hog Breeding Pointers.

[Written for Pacific Rural Press.]

From a dozen litters of purebred Berkshires, W. H. Waugh of Riverside raised 101 pigs to weaning age; while from eight litters sired by purebreds but out of common sows, only 60 pigs were raised to weaning age. This does not accord with the opinion commonly accepted without proof that common pigs are harder than purebreds. For on this farm of 10 acres, the capital invested in hog equipment, including buildings and feeding fixtures but not fences, wouldn't buy more than one or two of his beautiful September pigs. It certainly could not buy the pick of them; for Mr. Waugh does not reduce the quality of his breeding stock by selling the best.

Weanling Ration.—Mr. Waugh has adapted a ration found in one of the agricultural papers, to the feeds available in his section; and gives it systematically from weaning time for about eight weeks.

Weeks from Weaning	Pounds Ground	Pounds Milo	Pounds Wheat Bran	Pounds Tankage
One	1.6	2.0	0.2	0.20
Three	1.7	1.9	0.2	0.22
Five	1.8	1.8	0.3	0.25
Seven	1.9	1.7	0.3	0.27

It will be noticed that the carbohydrates (barley and milo) remained constant while the protein feeds gradually increased because the ration is for growing pigs. The original ration specified wheat middlings where ground milo has been substituted,

so additional protein had to be given. This is in the shape of skim milk from his own tuberculin-tested cows, so the pigs are fed three times per day on the theory that fewer feeds tend to intemperance in eating, and its resultant ills.

The buildings are the cheapest kind of open-sided sheds, the open sides being faced so the rains do not beat in. A dry place at night, and good balanced feed for the sows—that is the care these pigs get. Sows are kept in good but not fat condition by a ration of cocoanut meal, bran, and ground milo with pasture, while carrying pigs.

Breeding.—Mr. Waugh is staying close to Masterpiece and Rivals Champion blood, having noticed that the breeders who do not mix unlike strains often get the most uniform hogs, the best reputations, and the highest prices.

Three beautifully built but slightly undersized sows standing rather high on their legs are bred to the boar Wilts Masterpiece, which won first prize at Riverside Fair and lost the championship, according to Mr. Waugh, only because he was nearer breeding condition than show condition. This policy is carried out in the herd, which accounts for the apparently long legs of the sows mentioned above. Their undersize is due to the fact that they are to have

1210 Flood Bldg.

their third litters before they are two years old. Their first litters were each seven pigs, and their second litters each eight, of which all were raised. They were not bred thus early by Mr. Waugh, but by the man who had them previously. Mr. Waugh would not breed first under about a year old, for carrying and suckling pigs robs the finest kind of gilts of a chance to show their individual value.

Most of the shoats on the place are of great promise, showing well the results of their ancestry, and the entire herd is now cholera-immune. The herd sire is now six years old,

Value's Bachelor, sired by Star Value and out of Lady's Bachelor 5th.

LUMPS ON BAG AND TEATS.

[Written for Pacific Rural Press by H. B. Wintringham, Petaluma.]

To the Editor: What is the cause of small lumps size of a pea up to the size of an egg? Form on the base of cows teats around the udder and between teats, when ripe form a white head from which matter is squeezed out. When large ones come on it is difficult to milk. My cows are tied in stall, well bedded at night and fed plain alfalfa and grass hay. L. Y. Grass Valley.

Apply to State Veterinarian, Sacramento, for free tuberculin test.

GIVE YOUR COWS and YOUR-SELF A SQUARE DEAL

The more energy your cows are obliged to spend fighting flies, combating disease, and striving for physical comfort, the less they have for milk production. They are sensitive animals, and can do their best only under the most favorable conditions.

Transfer your herd to comfortable, sanitary, Louden Steel Stalls and watch the milk supply jump! The cows will be healthier, more contented, more productive; they can't help it. That's one side—the cow's side. Then there's YOUR side.

The increased production is clear profit—often a good margin in itself.

The stalls simplify the care of the cows. It's but a few moments' work to open the stanchions or snap them shut, and once in place you know the cows are safe. No chance to get loose, to become entangled, or to trample one another.

Let us quote you prices for your complete equipment.

CONFUSES HOG FEEDING WITH BREEDING.

To the Editor: I noticed the tale of "Razor" and "Chunk" in Jan. 20 issue of the Press. It certainly is very interesting, and just the kind of stuff I am looking for; as I am in the hog business myself. But I would like to ask you if you took into consideration the fact that "Chunk" possibly was a pen-raised pig, with expensive pedigreed ancestors. His maintenance, if he was a pen-raised pig and one year old, at three cents a day, would be about \$10 against his market value of \$23.75, which leaves \$13.75 profit.

"Razor," on the other hand, was an acorn or swamp-grass hog that never cost the raiser a cent until she was put in the pen to fatten, and 200 pounds of corn at \$1.50 per hundred, or \$3.00, would do this. This deducted from her market price, \$15.72, leaves \$12.72 profit; and you say she has possibly farrowed one or more litters, which leaves the owner six more razor-backed hogs running in the hills or swamps, to some time be sent to market.

As far as "Chunk" is concerned, his owner is out of the hog business with about \$1 the best of "Razor's" owner; but it doesn't look to me as if "Razor's" owner is liable to go out of the hog business very soon.

While it may seem to you that I have clinched into "Razor's" pen to stay, I will say that I took two of my best sows to a purebred boar this fall in hopes of getting better blood into my herd. I might add that I have 25 head of pigs shut up in a two-acre wild grass pasture that I am feeding pie- or cow-melons. They run outside until they are eight months old with no expense to me. I have been feeding them melons for about two months now, and by February I will start feeding corn and expect to put these hogs on the market at about 150 pounds at one year old at a cost of about \$5 per head. It only cost me \$3 a head to fatten them last year, but corn is higher this year. Send us some more of these tales. They are just what we fellows in this neck of the woods want.—C. J. E., Poway, San Diego county.

[The point we wished to bring out in the article referred to was the relative merits of a well-bred hog and one of nondescript breeding. Evidently you agree with us that under identically the same conditions "Chunk" has it all over "Razor" in the making of pork economically else you would not be going to the trouble of breeding to a purebred boar; and that, after all, is the only question involved. To credit "Razor" with a litter of pigs is manifestly unfair. She probably had brothers that did no better than "Chunk," while he doubtless had sisters with a far better average at farrowing time.—Eds.]

SHRINKAGE IN SHIPPING SHEEP.

In the old ewe feeding experiment which was conducted by the University of California during the early part of the winter some interesting data as to the shrinkage that results from shipping from farm to packer were brought out. The sheep were

shipped in two separate lots, the average weight of Lot 1 being 110.2 pounds at Davis, while Lot II weighed on the average 108.4 pounds. Both lots were on the cars 18 hours without feed or water, and weighed 104 pounds and 101 pounds respectively, off cars at South San Francisco, making a total average shrinkage of 6.2 pounds for Lot I

and 7.4 pounds for Lot II. As the sheep were sold for 6½ cents a pound f. o. b. San Francisco, the shrinkage charge was \$.481 per sheep for Lot II and \$.403 per ewe for Lot I.

Strict regularity in quantity and time of feeding the calf is most important.

DAIRYING.

At an auction sale held in Monterey county last week grade cows sold for an average of a little over \$75 a head.

J. T. Raitt of Santa Ana doesn't build resaw silos until he can use the newly cut silage as a scaffold, and he saves lots of bother that way.

There were 51 cows in the Truckee-Carson Cow Testing Association of Nevada that made over 40 pounds of butterfat during January.

A total of \$4250 was secured for 40 heifers and a like number of mature cows at an auction in Stanislaus county last week. Hay brought \$11.50 to \$12.50 a ton.

Many small dairymen are asking Farm Adviser Lee of Alameda county for advice on tuberculin testing with the intention of testing their cows for their own protection.

Nine registered Holstein cows belonging to C. Darnell of Imperial county averaged 61.1 pounds butterfat during January, according to the figures of the Imperial County Cow Testing Association.

There were 18 cows in the Orland Cow Testing Association that made better than 45 pounds of fat during January. The highest production was made by a Jersey-Durham grade owned by Faltings & Zimmerman.

The Danish Creamery of Fresno reports that the average price paid for butterfat during January was 44 cents per pound, the highest average in 22 years. The creamery handled 3,725 pounds more fat this year than during the same month in 1916.

The Holstein cow Ormsby Methilde Pietertje, owned by the Bridgeford Co. in Contra Costa county, has recently made a seven-day record of 32 pounds butter. This company is doing considerable official and semi-official testing at the present time.

A. E. Slater of Contra Costa county reports the purchase of a young Holstein bull sired by Lakeside Model from the herd of the Cornell University. Mr. Slater has a small herd of purebred Holsteins which he purchased three years ago.

Messrs. Thatch, Ennis, and Williamson of Riverside plan to auction all of their purebred Berkshires and the latter two will devote the ranch to dairying. Their four strings of grade cows average a pound of fat per day, according to Mr. Ennis.

According to J. H. Guill of Chico, the California State Holstein Breeders' Association will hold its annual meeting during the Butte County Spring Exposition. The California Holstein Breeders and Sales Corporation will hold a bull sale during the same week.

According to Farm Adviser Conner of Stanislaus county, there are 225 silos in that county at the present time. He states that there was an increase of 100 per cent last year, and it is probable that the same percentage of increase will be maintained during 1917.

Bids have been received and contracts will be let shortly for the erection of the milk condensary at Galt. The plant will handle the milk from 2500 cows when running at full capacity. It is said that the owners will erect five other plants in the Sacramento Valley.

E. O. McClure of Santa Ana is enthusiastic about his change of location last fall from Stanislaus county. He is getting 62½ cents for the butterfat in the whole milk which he sells for local use, as against about 42 cents when he was in the north. He has 60 head of purebred Holsteins now.

There were 44 cows in the Stanislaus County Cow Testing Association that made 40 pounds of fat or better during January. A Holstein belonging to H. E. Cornwall was

high with 97.9 pounds fat and a Jersey belonging to J. M. Bomberger was second with 92.38 pounds fat.

In order to take full advantage of the national advertising campaign which has been undertaken by the National Dairy Council they have started a city selling campaign and are asking all dealers and dairymen to co-operate with them in its workings. Interested parties should write to National Dairy Council, 130 North Fifth Ave., Chicago, Ill.

SWINE.

R. H. Whitten writes that he has recently sold one of the herd boars from his herd of Poland Chinas in Tulare county to Langley Brookes of Los Angeles county. The boar is Long Smooth Wonder, sired by Fesenmeyer's A Wonder and a proven breeder.

Elwood Mead, Professor of Rural Institutions at the University of California, has sent out letters to ascertain the cause of low-priced hogs in California and high-priced pork products. Farm advisers and others in a position to find out these things are being consulted.

SHEEP.

Feed conditions in Solano and Yolo counties, while not normal, are sufficiently good to carry the sheep now there through the season according to late advices.

Mr. Brockman, whose weather forecasts have been given in this journal from time to time, advises us that feed conditions along the coast below Salinas are good because of heavier rainfall than elsewhere in the State.

Feed shortage is reported by sheep men generally in San Joaquin county, range grasses being exhausted and hay being scarce and high. Some are reported to be feeding hay and corn in order to carry their ewes over with little or no chance of saving the lamb crop.

While feed conditions vary greatly in Alameda county, some sections report such a shortage of feed that sheep owners are killing their lambs in order to carry their ewe bands through the winter. Some cattle are also reported to be dying in the dry districts of the county.

BEEF CATTLE.

Wm. Carruthers advises us that he has secured the services of Col. Carey M. Jones of Chicago to handle his sale of registered Shorthorns at Mayfield, May 2.

R. M. Dunlap writes from Omaha that he expects to buy one of the great young Shorthorn bulls of the Middle West for shipment to California.

David Stollery of the Paicines Ranch Co. advises us that he has recently sold three choice yearling Shorthorn heifers to the University of California. Two of them were sired by Bessie Consul, he by King's Consul out of Roan Bessie, and the other was sired by College Count 3rd, he sired by College Count and out of Peggy Wornill. Prof. Gordon H. True selected the stock for the University.

MISCELLANEOUS.

The Directors of the Butte County Spring Exposition Association have decided to hold their Third Annual Fair at Chico the week beginning May 21, 1917.

In order that they may market their livestock direct, 187 members of the Glenn County Farm Bureau have agreed to market all of their stock through a market man employed by the bureau.

It is said that Monrovia's milk supply is to be safeguarded by tuberculin test and bacteriological count of the milk to begin March 1. The

milk will then be graded "A," "B," or "C," according to the provisions of the new State law.

"Which is better for Imperial Valley—Livestock or Cotton?" is just now being warmly discussed by the farmers there. The livestock advocates are being led by S. E. Robinson and Judge E. R. Simon and the cotton growers by W. E. Wilsie and Marvin W. Conkling.

The Drovers' Telegram of Kansas City, in its annual review issue of January 1, says: "The highest level of livestock values ever attained in the realm of livestock prevailed in 1916. The average top price of cattle for the year was \$10.53, hogs \$10.00, and sheep \$9.82.

One of the most comprehensive reports of livestock receipts and prices ever issued on the Pacific Coast is just at hand from the Portland Union Stock Yards in the form of an annual report for the year 1916. The report shows an increase in receipts of California hogs at that market during 1916 over all previous years.

The monthly meeting of the Napa County Livestock Association was

WANTED—Machinery and equipment for cannery—new or second-hand. R. G. Root, Rte. 3, Sacramento, Cal.

COUNTRY LANDS.

NO MONEY IN FRUIT—unless you have the right kind of an orchard. I have the right kind: 3¼ acres of Newtowns and Spitzemburgs which yielded 3,300 boxes the past two years. The average price received was about \$1.25, making over \$4,000 for the two crops. After deducting all spraying, irrigating, harvesting and marketing expenses, there was nearly \$3000 left from the proceeds of the two crops. The trees are getting bigger and better all the time and the market has averaged about the same—\$1.25—for the past eleven years. Fine place for cow and chickens, the ground being covered with clover and grasses, which grow luxuriantly. No cultivation needed. Big packing-house, fire-alarm residence, city water, phone, electric lights, etc. This is not a farm, but choice city income property, well located in the finest residence city on the coast—Ashland, Ore., which has a population of 5,000 and a great future as a health resort. Price, \$7,500; encumbrance, \$1,000. Reasons for selling are purely personal. Would consider trade for farm or acreage of similar value in low altitude. O. H. Barnhill, Ashland, Ore.

HUMBOLDT STOCK RANCHES—\$10.00: Safe Sheep Range of 5000 acres on State Highway. Neighborhood controlling coyotes; three hundred pounds. \$10.00; 5700 acres. Cattle Ranch near Railroad. Joins Forest Reserve. 500 acres tillable. Good soil. \$4000.00: Half cash. Worth it. Will Perry Ranch with tools, Alderpoint. Se owner. Bad health. Just returned to S. F. Sold Curless Ranch, Blocksburg. C. E. Robertson, 105 Montgomery St., S. F.

FOR SALE—948-acre stock ranch in Napa county. Price, \$17,000 net. All modern improvements. Living creek. 125 acres hay, grain and alfalfa land. Free range adjoining. 175 head of cattle can be purchased if desired. Liberal terms. Owner, Box 363, Napa, Cal.

FOR SALE—20 acres good alfalfa or fruit land. Splendid location, 2 miles from Modesto. Fair improvements, leveled, checked. Only \$5500. \$3000 can remain 5 years. J. H. Wilder, owner. Rt. 1, Box 129, Modesto, Cal.

FOR SALE—BARGAIN—Coacabella Valley land. Level, silt, no alkali. Easy water, best quality. Station three and half miles. Dates, earliest fruits and vegetables. Auto road. Owner, 1142 West 11th St., Riverside, Cal.

FOR SALE CHEAP—320 acres good level land in Klamath County, Oregon. For information, address owner, W. H. Johnson, 22 Maple Ave., Watsonville, Cal.

TO LEASE—170 acres level land. Fine for cows or hogs 50 acres of growing barley. Enquire of Miss V. E. Field, Ukiah, Cal.

FREE NEW BLUE BOOKLET—State, Government and Indian Lands. Bargains overlooked. Joseph Clark Sacramento.

WANTED TO HEAR from owner of good ranch for sale. Send cash price and description. D. F. Bush, Minneapolis, Minn.

640 ACRES MONTANA HOMESTEADS—new law. Circular free. Bureau 27, Boulder, Mont.

held at St. Helena February 3, a good attendance being reported. Prof. Gordon H. True was the principal speaker, his subject being "The International Livestock Exposition and the Showing Made There by California."

The new law enlarging the grazing area in the public domain to 640 acres has brought out a rush of applicants to the Los Angeles land office. So far, the proposed entries, which are suspended pending an investigation of the character of the land, are confined to that part of the Tehachapi region within the jurisdiction of the Los Angeles land office. A total of 65 applications, covering 21,729 acres in the northern part of the State, is also reported for the week from Sacramento.

More animals were slaughtered under Federal inspection during the last fiscal year than in any previous year since meat inspection was begun. The total for the 12 months reached 62,304,522 animals. Nearly 7½ billion pounds of meat and meat food products were prepared and processed under inspection. Certificates were issued for the export of over 510 million pounds of beef and beef products, more than 1,373,000,000 pounds of pork and pork products, and about 12,344,000 pounds of mutton, or a total of 1,895,863,936 pounds.

MANURE \$10 A LOAD.

H. H. Ford of Redlands has established a dairy herd at Highlands from which he hauls manure across the valley and up the southeastern hills for his orange grove. It cost \$10 per load of 200 cubic feet but is cheaper at that, according to W. N. Barlow who has charge of the oranges, than to ship it in. Four horses are required per load.

It is well to wet down the silage every time you pack it after the filling process. If you are able to squeeze water from a handful of the corn cut, the silage will need no water at filling.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

SEND FOR FREE CATALOG—Finest ever issued. Tells of the famous Whitten Ranch money-making strain of Big Type Poland-Chinas. MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT Co., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreet, or San Francisco banks. Office, 319 Underwood Building, 525 Market St., San Francisco.

LIVE STOCK INSURANCE—Registered live stock and farm work horses should be insured. The Hartford Company, strongest in the world, writing live stock. No trouble to answer questions. D. O. Lively, special representative, 215 Hobart Bldg., San Francisco.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

Adulteration of Feeding Stuffs Practiced.

Agitation favoring more stringent laws regarding the licensing and inspection of feeding stuffs has been more or less spasmodic in California, although the need for such has been recognized by most every one in the feed buying and selling business. Our attention has been drawn to the need of such a law in California because of the adulteration of cottonseed meal which is being practiced by many, if not all, of the cottonseed meal mills. One large beef cattle feeder states that he not only has to pay for a large percentage of hulls in the meal he is now buying but has to pay freight as well, which

materially increases the cost of feeding operations.

Evidently mills all over the country are making it a practice to adulterate with hulls, as advice from the Ohio Experimental Station says that a five-ton lot of cottonseed meal bought by the Experiment Station was guaranteed to contain 38.5 per cent protein, but one sample analyzed 27.3 per cent and a second only 17.4 per cent. It contained a large amount of finely ground hulls, which have a lower feeding value than oat straw or corn stover. A carload lot also contained less protein than guaranteed. Of ten brands

in the latest inspection bulletin of the Ohio State Board of Agriculture nine were below their guarantee.

Not only is this a costly practice for livestock feeders, but to cotton growers as well, for it is certain to reduce consumption of a cotton by-product whose more general use is profitable to grower and feeder. Because some few rice mills in California see fit to adulterate rice bran and middlings with hulls, a good deal the same condition exists with that by-product as with cottonseed meal, in spite of the fact that a good market is being made in this State for such feeds among farmers.

Apparently a law providing for certified analysis on each sack of feeding stuffs would be of benefit to the honest manufacturer as well as to livestock feeders.

SHOULD HE USE GRADE BULL?

To the Editor: I know it is against the ordinary rules of breeding practice to breed to grade bulls, but I have a grade Jersey cow, evidently part Durham, which has brought six heifer calves in succession. Three of these heifers and a granddaughter are all high producers and all the stock from this cow are very nearly alike in conformation, showing strong prepotency. The oldest of these heifers, that made two pounds of fat with her first calf, has just dropped a bull calf. Under the circumstances would it not be good dairy practice to save this bull and breed right back, both to the same family and to the rest of the herd? He is from a registered Jersey bull, as are all the others, and solid in color.

I have a good many heifers from different registered Jersey bulls but my experience has been that but a small proportion of them finally turn out to be high producers and it does not seem possible I would be going backward to save this bull.—F. D. K., Hughson.

[Answered by Prof. Gordon H. True, University Farm, Davis.]

Replying to your subscriber I would say very frankly that I would not follow the plan concerning which he asks advice. He evidently has in mind the fact that certain skilled breeders have built up their flocks and herds by the practice of close breeding. This, of course, cannot be denied, but where one man has been successful in his breeding operations so conducted, many have failed.

The fact that it is proposed to start on a system of inbreeding with grade animals makes the outcome seem more questionable. The bull calf that it is intended to use as a herd sire contains but one-fourth of the blood of the prepotent cow referred to. The heifers to which he would be bred contain but one-half of the blood of this cow, and with the well recognized tendency of the progeny of mixed breeding to develop characteristics of both sides of the cross, it seems to me that best results could scarcely be reasonably expected from the line of breeding that it is proposed to follow.

The fact that the dam of the heifer has made 2 pounds of butter per day should not recommend her especially when purebred sires from dams of high producers are available at comparatively low prices. The fact that your subscriber has had a comparatively small number of high-producing heifers from purebred bulls cannot be seriously taken as an argument against the use of a purebred sire as against a grade of even high-producing ancestry.

Registered Jacks

Range raised; Guaranteed satisfactory breeders. Field Jacks a specialty. Registered Shire Colts. Will trade for young mules, horses or land.

"Good to the Last Drop"

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

HOLSTEIN CATTLE

The scope of its labors and the numerous details involved in the administration of the affairs of the Holstein-Friesian Association are best comprehended by a consideration of the fact that, during the fiscal year ending April 30, 1916, \$158,994.50 was received by the secretary's office for the registration of pedigrees and for transfers. This volume of business required 46,760 entries in the cash books, and the issuance of 142,120 certificates, and this prodigious labor is demanded for the conduct of but one department of the greatest dairy cattle breeders' association in the world.

Redwood for Durability.

"Short Measure—eh?"

A cow can not tell you when she is sick, but her milk yield is a very accurate indication of her condition. The fact is, thousands of cows are allowed to remain unprofitable or below their reasonable standard of productiveness through their owner's failure to act on the hint of the milk pail. Don't pass it off by simply calling her a "backward cow"—correct the trouble and reap the extra profit.

Kow-Kure is a medicine for cows that are "off color." It is in no sense a food, but it promptly acts on the digestive organs and enables the cow to thrive on her natural food. Its great curative powers act on the genital organs where many cow ailments originate. The success of Kow-Kure is positive in the prevention and cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Scouring, Lost Appetite, Bunches and other common ills.

You can buy Kow-Kure from feed dealers and druggists, in 50c. and \$1.00 packages.

COW WITH FITS.

To the Editor: I have a cow that has fits. I first noticed her having this trouble last fall when she was in a corn field trying to eat the tops of high stalks. She put her head up and turned around several times in a circle, finally falling to the ground. She has good pasture and all the alfalfa hay she wants. What will help her?—H. J., Terra Bella.

Give this cow 4 ounces epsom salts daily till the symptoms are relieved.

HORSE HAS SORE ON NOSE.

To the Editor: I have a horse whose nose muzzle wore off a patch of skin on the top of his nose about the size of a dime, last summer. There is a growth forming like a mushroom, about the size of a dollar, on top. What is the best method to get rid of it and heal it up?—J. F. T., Linden.

Paint this growth with a 2 per cent solution of chromic acid twice a day till it disappears.

HORSE WITH LICE.

To the Editor: I have a horse that is covered with lice. Have used kerosene and lard but without results. What else can I do?—G. K., Los Molinos.

Boil up a bar of soap in three quarts of water. When dissolved add one quart of coal oil and mix thoroughly. Apply this to the animal and rub in well.

HORSE NEEDS VETERINARIAN.

To the Editor: I have a young horse that seems to be troubled with coffin-joint lameness. When I take him out of the barn in the morning he seems to be lame in his feet, but after walking a little while he gets all right unless going up or down a hill on a pull, when he seems to flinch. Liniment seems to help, but only temporarily. What can I do for him?—G. D., Lompoc.

It is impossible to diagnose your case at this distance. Call in your veterinarian.

SIZE OF HERDS AFFECTS TUBERCULOSIS.

While the present dairy laws were severely criticised by some on the grounds that they would do irreparable damage to small dairymen because of the high percentage of reactors which would have to be discarded, the work of State Veterinarian Chas. Keane and his assistants for the months of October, November and December indicate that such criticism was ill advised. During that time 503 herds containing 10 or less cows were tested, only 15 per cent of these herds showing any indications of tuberculin animals. In larger herds, though, the per cent of herds containing reactors was larger, 25 per cent of the 198 herds of this size contained some reactors.

That these facts are appreciated by dairymen, and that many are having the State do their testing, which they would not be compelled to by law, is shown by the fact that applications for the testing of 75,000 to 100,000 cows are now on file with the State Veterinarian.

A good dairy herd is obtained by using a purebred sire. You can get calves 98 per cent purebred in six generations.

POOR MILK FLOW.

To the Editor: My cow freshened two or three days ago but doesn't give any milk to speak of. She was dried up two or three weeks before freshening. She eats well and doesn't seem to be sick. What can I do for her?—I. E., Acampo.

Give your cow the following: Philocarpine, 6 grains; strychnine, 3 grains. Dissolve this in water, divide into three doses, to be given six hours apart.

Silage, under normal conditions, is worth four dollars per ton.

GRANDSONS OF TILLY ALCARTRA

We now offer two young bulls for sale that are old enough for service. No. 1—Born Sept. 13, 1915.

Prince Alcartra Korndyke.
Best bred son of Tilly Alcartra.

No. 2—Born Sept. 3, 1915. His dam is a heavy producer and will be put on test next time she freshens. His full sister has a record of 18.56 lbs. butter in 7 days at age of 2 years 3 months and will be kept on test for the year.

The bulls are nicely marked, have perfect top lines, are good individuals and both sired by Prince Alcartra Korndyke, who now has 6 A. R. O daughters and more coming.

Write for prices, or better come and see them.

"THE NAME GIBSON INSURES QUALITY."

No Other Six Resembles Hudson Super-Six

Don't Be Misled—It Is a Hudson Invention

Sixes have come into renewed popularity since the Super-Six won the top place. But the Super-Six invention—controlled by our patents—added 80 percent to the six-type efficiency. And that 80 percent is what gave it supremacy, when the V-types threatened to displace the Six.

Late in 1915, remember, the Six was a waning type. Even the Light Six, which Hudson gave first rank, had revealed some vital engineering limitations.

It had not solved the problem of motor vibration. It had not minimized friction and wear. Its endurance had proved disappointing.

Sixes at that time held hardly a single record. They were mostly held by Fours.

And leading engineers, including the Hudson, were seeking a remedy in Eights and Twelves. At that time the Six, for high-grade cars, seemed verging on displacement.

What Saved the Day

It was the Super-Six invention, remember, which then saved the day for the Six.

Hudson engineers discovered the shortcoming. By a basic invention they corrected the fault. They ended nearly all the vibration. They doubled the motor's endurance. Thus they created a motor which has since won all the worth-while records.

But that doesn't mean that the old-type Six is any better than it was.

'Twas the Super-Six That Won

The Super-Six, in a hundred tests, has out-performed all other motor types. It has not merely broken records. It has made new records which, a year ago, no man considered possible.

It broke the 24-hour endurance record by 52 per cent. It broke the transcontinental record twice in one round trip. A Super-Six touring

car went from San Francisco to New York and back in 10 days and 21 hours.

It beat twenty famous rivals up Pike's Peak. It broke all stock-car speed records, and all for quick acceleration.

Then, after 7,000 record-breaking miles, it showed itself in new condition. Not a part or bearing showed evidence of wear.

No other motor ever built has shown anywhere near such endurance.

All By Saving Waste

The Super-Six develops no more power than other like-size motors. It simply delivers more. It almost eliminates motor friction and wear by ending nearly all the vibration.

That vibration, which wasted power, was the great fault of the Six. It is that which led to the Eight and Twelve as a possible solution. Any motor in which that fault remains can't compare with the Super-Six.

A New Gasoline Saver

The Hudson Super-Six, in endurance and performance, stands foremost in the world. The new style bodies which we have created make the car look its supremacy. A new exclusive feature—a gasoline saver—gives it this year another advantage.

It now outsells any other front-rank car. It has 25,000 enthusiastic owners, who know that no rival can match them.

You can prove in one hour, at any Hudson showroom, that this car deserves its place. And that no other car, at any price, can be classed with it. Do that before the spring demand overwhelms us.

HUDSON MOTOR CAR COMPANY, DETROIT, MICHIGAN

and poultry, and now all at once some man with a title steals my thunder and comes out as the "first" advocate in the State for bees, fruit and poultry. And I should not be a bit surprised if he influences more folks than I have because he is a "Professor." Well, that is all right; I'm not going to quit because he just commenced, so in this paper I am going to say once more: Get a few hives of bees, and put as many chickens as you can well care for under the fruit trees. Chicken money is the nimble sixpence; it comes in often and it helps the trees to produce better and bigger fruit.

The chicken business is not a get-rich-quick scheme, neither is it a lazy man's job; however, as a legitimate means of adding to your yearly income on the farm there is no better or safer way than by having a flock of good laying hens. If you get chicks within the next three months, next winter they will be bringing you back the money you put into the investment. You don't have to wait several years for returns, for as soon as the pullets mature they commence to pay back their own debt. Now is the time to think this over.

PREFERS BLUE OINTMENT FOR LICE.

To the Editor: I notice "C. F. C." Fresno, has an inquiry in your paper of Jan. 27 as to how to get rid of lice on his poultry. I have lately tried blue ointment and found it a sure remedy, much easier and pleasanter to apply than the insect powder. Mix the ointment with 50 to 60 per cent of vaseline. I think lard might do. Take a little on the end of the finger the size of a pea or less and rub in well below the vent, and a little under each wing, then repeat in about two weeks. I could not find one when I made the second application, but I found two or three of the hens were slightly blistered. I suppose I put on a little more than I intended. I had previously dusted them with insect powder, getting a large per cent of it in my eyes, nose and clothing, and the first time I examined them afterwards they were badly infested with lice.

Devore. T. S. Johnson.

"CHINESE DUCKS."

To the Editor: Who has a breed of ducks that are mostly black and have a comb somewhat like a turkey? They are called "Chinese ducks." How can I distinguish geese from ganders?—R. P., Richvale.

[Answered by Geo. H. Croley.]

We know of no Chinese ducks such as our correspondent describes. The colored Muscovy duck has peculiar formations on the head and face that are red and somewhat similar to the color of a turkey gobbler's wattles. The simplest method of distinguishing ganders from geese is to note the difference in the voice, particularly when they are simply "talking." The voice of the male is shrill and fine, while that of the female is coarser and harsh. It is more difficult to distinguish them when they are calling in a loud tone.

Arlington poultrymen will contract for the transportation of the product of their poultry farms from Arlington to the Los Angeles market by motor truck.

RICE FOR PIGEONS.

To the Editor: Is rice good for pigeon feed? If so, how can I teach them to eat it? I have tried it raw, soaked and boiled and they won't eat it.—P. A., Lodi.

[Answered by Geo. H. Croley.]
